"Mr. Principal,—Aware of my very limited experience in Academical matters, there are very few questions on which I feel disposed to trouble the Senatus with my sentiments; but on a subject so purely professional as that now before us, I must, with all possible respect, crave permission to be heard.

"In looking over the regulations for degrees submitted to us by the Medical Faculty, the first passage which arrests my attention is in the second page, where the candidate is required to lay before the Dean of the Medical Faculty, 'a statement of his course of studies, both general and medical.'

"Now, Sir, upon the subject of general studies, I could wish that something more specific had been said: the want of a provision for insuring a preliminary course of classical and scientific education appears to me to constitute one of the principal defects in the manner in which graduation has hitherto been conducted. Looking, Sir, to the liberal and philosophic views which medical men in the present day are expected to possess, I cannot think that there is any thing unreasonable in requiring those who aspire to the *chief honour in Medicine*, to give proof, not only of a competent knowledge of Greek and Latin, but to evince an acquaintance with the principles of Mathematics, of Natural Philosophy, and of Natural History.

"In contending, Sir, for this extended preliminary education, I am conscious that I contend for qualifications, which I myself possess but in a limited degree. That, however, Sir, is attributable to my own idleness and inattention in my earlier days, and not to the want of opportunities; and, although this may render me more indulgent, it does not render me more blind to the still greater defects of others. Of these defects, several very remarkable, and some very recent instances have fallen within my own observation. I am told that six months have not yet elapsed since two gentlemen, who had not indeed obtained their degrees, but who had passed their first and principal examinations before the Medical Faculty, were subsequently rejected at Surgeons' Hall, and remitted to their studies; one of them, *inter alia*, for an incompetent knowledge of the Latin language. But, Sir, it is not only of the Latin, but of the English language, that some of our graduates are ignorant. A short time ago, when Dr. Hennen was at the head of the Medical Department of the Army in North Britain, he showed me several official communications from the surgeon of a regiment, then stationed in the west of Scotland, which were so defective in point of grammar and of spelling, that Dr. Hennen, with a forbearance, a liberality, and a kindness, which he was but little called upon to exercise, withheld these communications from the head of the Army Medical Board, and forwarded the substance of them in his own language: the gentleman from whom they came was, I blush to say, a graduate of the University of Edinburgh! I consider it unnecessary to occupy the time of the Senatus longer, by enumerating more cases of this kind. I believe I have the general voice of the Profession and of the public along with me, when I say, that the elevated degree of Doctor of Medicine ought not to be hastily bestowed on men destitute of literary and scientific acquirements. I have been told, Sir, that, by insisting on a preliminary course of education to the extent I wish for, many able candidates will be deterred from coming forward, and the number of our graduates greatly diminished. I am by no means sure, that such will be the result: Reasoning from an analogous case, we have no right to expect it. Certain it is, that the number of candidates for diplomas at Surgeons' Hall has been greatly increased since the qualifications required there, have been more extended. But, Sir, I am disposed to enforce this preliminary education at the risk of diminishing the number of graduates; for it does not follow, that, because the number of candidates for degrees is less, the number of our pupils must equally diminish; on the contrary, Sir, it is an unpleasant truth, but there is no disguising it, that Edinburgh stood higher in the public estimation as a school of Medicine when the number of graduates was less. I do not mean to connect the two things as cause and effect, but such is the fact; a fact which I would not willingly dwell upon out of doors, but which, in the bosom of this family, I state with confidence. I, Sir, for one, have no sort of ambition to see 100 or 120 boys graduate here annually, but I have an ambition to see the reputation of the Medical school sustained, and the character of our degree enhanced; to see it made an object of desire to men of literary attainments and of professional stand-

University of Edinburgh.

Professor Ballingall.

1 November 1826.

ing. Let the characters of the Medical school, Sir, be upheld by the individual merits of its teachers, and not by its becoming an easy passport to professional honours. One word more, Sir, upon the mode of insuring this preliminary education, on which I have so much insisted. This might be done, I think, most effectually, by requiring the candidate to submit to an examination before the Faculty of Arts, provided he has not previously obtained the degree of Master of Arts from this or from some other University. I know, Sir, that some of my colleagues consider it hard to compel a man to attend a University for the purpose of acquiring that information which he may get more economically and more expeditiously elsewhere; but, Sir, I hold it as a general principle, that those who are ambitious of *Academical honours* must be content to seek them by *Academical means*. I can, therefore, see no hardship in requiring those gentlemen who are ambitious of the chief honour in Medicine, either to produce their diplomas as Masters of Arts, or, in the event of their not having attended the requisite classes for this purpose, to subject themselves to an examination before the Faculty of Arts, on those preliminary topics which I have enumerated,—Greek, Latin, Mathematics, Natural Philosophy, and Natural History. We all know, Sir, that a Doctor's degree is by no means necessary to enable a man to gain his bread in our profession; nor is it at all desirable that every Medical man who aspires to anything beyond the spreading of a plaster, or the weighing of a dose of jalap, should be furnished with such a testimonial. But, Sir, if a man's ambition leads him to covet this Academical distinction, let him, I say again, subject himself to Academical rules.

"I come now, Sir, to the classes enumerated in the Curriculum, an attendance upon which is required of the candidate for a Medical degree: these are, Anatomy and Surgery, Chemistry, Botany, Materia Medica, Theory of Medicine, Practice of Medicine, Clinical Lectures, and Midwifery. Now, Sir, from this list I have nothing to take, but something to add. One of its most important defects appears to me to be the want of a provision for enforcing the study of Practical Anatomy; a branch of education which I hold to be essentially requisite to the accomplishment of every Medical man, whether Surgeon or Physician. We are all aware, Sir, of the obstacles thrown in the way of prosecuting this branch of study, and it is the standing objection in the mouth of every one who excepts to the present state of the Edinburgh School; but, Sir, when we hear private lecturers boasting of their being able to instruct in Practical Anatomy twenty, forty, ay even sixty pupils annually, we cannot believe that the Professor of Anatomy (with that countenance which he has a right to expect from the public authorities) can have any insurmountable difficulty in teaching the number of candidates who may appear here annually for graduation. But, Sir, if the Professor of Anatomy avows his inability to teach it here, let it be studied elsewhere; but let us not dispense with a branch of study so essentially necessary; and above all, let us be cautious how we give countenance, by such an act, to an opinion of the inefficiency of the Edinburgh School. So much, Sir, do I consider the difficulties in the way of prosecuting Practical Anatomy as the leading objection in the minds of the public to this Seminary, that I am persuaded, were we enabled to hold out opportunities of affording competent instruction in this respect, it would do more to support the character of our School, and to increase the number of our pupils, than all the Curricula we can devise.

"Besides the classes already enumerated, there are three other classes connected with the Medical Profession, on which I beg the Senatus will indulge me with a very few words. These are, Medical Jurisprudence, Clinical Surgery, and Military Surgery.

"An acquaintance with Medical Jurisprudence I hold to be essentially necessary for every accomplished Physician. How far I consider that branch of Medicine capable of being studied with advantage in private, or how far I consider an attendance upon a public class necessary to attain a competent knowledge of it, I am not now called upon to say; but a class having been instituted in this University for instruction in Medical Jurisprudence, I am clearly of opinion, that every graduate should be compelled to attend it.

"With regard to Clinical Surgery, I would observe, that if a knowledge of Surgery is considered essential to the education of a Physician (and there is every good reason why it should be so) I hold that Clinical instruction in this department is peculiarly necessary. Of the importance in which it is held by a very competent judge, the present Professor of Anatomy and Surgery, I cannot give a better proof than by stating, that that learned gentleman was himself for one or more courses a pupil of the present Professor of Clinical Surgery.

"With regard to Military Surgery, I entertain an opinion perhaps somewhat peculiar. I have been repeatedly told, that Military Surgery differs in no respect from common Surgery; and I have even been pressed by my friends to model my course, so as to render my tickets admissible at Surgeons' Hall, as equivalent to a full course of Surgery: this I have hitherto declined, and still decline, doing. Considering, Sir, that while it is my duty to embrace, in my course, an extensive range of important Surgical subjects, it is more peculiarly my province to dwell upon those Surgical diseases and accidents to which soldiers and seamen are more particularly exposed; and to point out those peculiarities of practice which Military and Naval Surgeons are often compelled to adopt, from the singular and unforeseen circumstances in which they are placed. The view I take of my subject is already known to you, and to my colleagues of the Medical Faculty, from the printed prospectus which I had last year the honour of putting into your hands. The plan of my course, I am proud to think, has the unqualified approbation of the highest authority (the Director-General of the Medical Department of the Army), and to that plan I shall adhere; but insomuch as my course differs from a common course of Surgery, insomuch is it unessential to the education of a Physician. I do not therefore urge any claim in favour of the Chair which I have now the honour to fill; and however unpleasant it may be for me to be the only Medical Member of the Senatus whose class it is not considered necessary for graduates to attend; still, Sir, I will rather, infinitely rather, stand alone, than press forward a claim which my judgment does not dictate, and in which my conscience does not support me.

"With regard to the mode of conducting the Examination for Degrees, whether in Latin or in English, I hold this to be a matter of very inferior moment, provided the preliminary education I have ventured to recommend is insisted on. I am still, however, disposed to lean to the Latin examination, as calculated to uphold the literary character of the University and of its graduates, as well as to facilitate the acquisition of our degree to foreigners, most of whom express themselves more fluently in Latin than in English.

"There is some little ambiguity in the wording of some parts of the proposed regulations, on which I do not choose to dwell; and it now only remains for me to apologize to the Senatus for having occupied so much of its time, and to thank you for the polite attention with which I have been heard. The sentiments which I have now expressed may appear to some Members of this learned body as crude and undigested; they are the sentiments of one extremely inexperienced in Academical matters;

University of Edinburgh.

Professor Ballingall.

1 November 1826.

but they are the sentiments, Sir, of a practical Surgeon, upon a professional subject,—they are the sentiments of one who, as an apprentice, a student, a practitioner, and a teacher, has now been for upwards of four and twenty years a member of his Profession; and who, during that period, has been incessantly occupied in some of its busiest scenes."

In addition to the above, with a view of making known my ideas on the Curriculum, I would wish to state the substance of a speech which I delivered before the Senatus Academicus, upon seconding a motion for the addition of the class of Clinical Surgery to the Curriculum for Medical degrees. [*Dr. Ballingall stated, that at a subsequent meeting of the Senatus Academicus, he enforced these ideas in a speech which he then delivered; the speech was read.*]

Have you had an opportunity of seeing some notes which Dr. Alison has made out, and which it is understood he read to the Faculty of Medicine, though you were not one of that Faculty?—No, I have not.

Are the Commissioners to understand that you would wish to make the Professorships of Medical Jurisprudence, Clinical Surgery, and Military Surgery, imperative classes, previous to graduation in Medicine?—The classes of Medical Jurisprudence, and Clinical Surgery, and Practical Anatomy most especially, but not Military Surgery.

Would you wish to see introduced into this University a separate Professor of Surgery apart from the Professor of Anatomy?—I think it would be beneficial to the School. A branch of so much importance as Surgery should be taught separately; having it connected with another Professorship seems an anomaly.

Supposing a Professorship of Surgery were established separate from the class of Anatomy, would you make it imperative on students to attend that?—Yes, I would; I think it is a branch of much importance, and that every Medical man should attend it, whatever line of practice he may afterwards adopt.

Is there any other suggestion you wish to make to the Commissioners as to the general education of the University, independent of Medical Studies, or with respect to its general discipline or constitution?—I am not so competent to judge of these matters; I think preliminary education ought to be enforced upon men who aspire to the degree of Doctor of Medicine. I have given my views of that in the papers to which I have alluded.

Would you wish to suggest anything in the way of improvement as to the constitution of the University?—I have nothing to suggest particularly on that subject.

Have you turned your attention as to whether it would be an improvement to have public examinations previously to granting degrees; if there were a classification of the Students at that time, with respect to their proficiency, in the shape of honours or prizes; or any other form that might be best adapted to create emulation?—I am rather disposed to think it might be beneficial.

Have you thought upon the propriety of establishing essays, with prizes to be annexed to the best of them?—I am in favour of that measure; I cannot say I have thought much upon it; as a general measure I should rather be in favour of it.

Are the Commissioners to understand that anything in the shape of improvement with respect to Medical degrees in education, may be said to be contained in the observations which are in the papers you have read?—Yes.

Are there no farther remarks you would be desirous of making verbally?—No, none.

Would you consider the establishment of a separate Professorship of Surgery as interfering with your particular department?—Not at all; I think there is quite room for both. According to the view I take of my subject, I confine myself to a particular course of instruction, which is not adapted to a general course of Surgery. There are many subjects which come *à propos* to my class, which are quite out of a course of general Surgery; and I omit several subjects, because they are not so common among Military and Naval men, as among the other classes of the community. Soldiers and sailors are a select class of people, who are inspected previously to going into the service, and are ascertained to be free from disease.

Do you think that it is the duty of the Professor of your class to confine his lectures to the casualties and accidents which are incident to the life of soldiers and sailors, and not to embrace the whole subject of Surgical operations?—Certainly, I do show most of the Surgical operations; but many of them are comparatively rare in Military and Naval life.

Would you think it of advantage if the several Professors of Medicine were to examine their students particularly upon subjects of practical importance in their classes?—I think it might be useful if there were occasional examinations; I do not know that any continued or systematic course of examination would do, but I think occasional ones upon practical subjects would be of advantage.

In which of the classes do you think examinations might most properly be introduced?—Why I think in all the Medical classes occasional examinations might be instituted with advantage; the only difficulty that would be found would be in those classes where the numbers would be so great, that they could not be conducted without a great waste of time, and without omitting material parts of the course, unless the time were prolonged. Where the numbers are limited, I think the introduction of occasional examinations would be beneficial.

What do you think is the chief use of them?—To fix the attention of the students upon those points which are of most importance, and to see if they comprehend the Professor's views of these subjects.

Might not very short questions be put, which would enable the Professors to ascertain how far the students had attended and received benefit from the lectures?—I think so.

Do you think there would be an indisposition on the part of the students to submit to examination?—I do not think so.

Are you not convinced that many of them would consider it a great privilege?—I judge

very much upon that point from the conduct of my own apprentices, who, I find, are all eager for it. I examine them once a month, or oftener, and I find them eager for examination, and that they consider it a great advantage. I believe the disposition extends more widely, and that the students would be all pleased with it.

University of Edinburgh.

Professor Ballingall.

1 November 1826.

Might not examinations revive in the memories of those students many essential parts of their instruction?—That is another point of view in which I think it would be exceedingly useful.

Has anything also occurred to you on the subject?—Nothing particular.

Might it not give them a facility of expressing themselves upon Medical subjects?—These are all collateral advantages accruing from it, which I think would render it useful. In fact, I think the chief objection to it is the numbers of some of the classes.

Would you think it desirable to have any previous examination of Medical Students when they come up to the University, as to their knowledge in the languages particularly, or in any other branch of literature?—I think that exceedingly desirable. I think the proposal specified in my Memorial meets that; they should be compelled to produce the degree of Master of Arts, or submit to examination before the Faculty of Arts.

Would you think it desirable, therefore, that a power of rejection should be lodged with the Faculty of Arts?—Yes.

Might not the members of the Faculty of Arts feel a delicacy in rejecting the students, by reason that the patrimonial interests of others might be supposed to suffer?—I do not know; I do not see that they should have any such delicacy. I think if they were held responsible to see that no man should be admitted into the profession without sufficient literary and scientific attainments, it would be their own concern to conduct themselves accordingly; I would hold them entirely responsible for the literary and scientific qualifications of those gentlemen who come forward as candidates for Medical degrees.

Supposing the alterations were effected, which you and others think would be an improvement in the University, would you propose to increase the number of examiners for Medical degrees, or would you keep them as they are?—I think the Professors of all those branches that are made imperative on students should be made examinators also.

In whom would you vest the appointment of examinators?—In the Senatus Academicus as a body.

Edinburgh, Thursday, 2d November 1826.

The EARL of ROSEBERY in the Chair.

Dr. *James Hamilton*, Junior, Professor of the Theory and Practice of Midwifery in the University of Edinburgh, called in and examined.

Are you Professor of Midwifery in this University?—Yes, I am.

Professor Hamilton, junior.

Have you read over the Queries which were sent to the Senatus Academicus, and the Answers which have been returned to them?—I have, but rather superficially; they were left in the Senate Hall here, during the forenoon, and I am in general so occupied about that time, that I have had only an opportunity of glancing them over.

2 November 1826.

Do you agree in the sentiments contained in them, so far as you have had an opportunity of reading them?—There are several little points, which seem to me to be inaccurately stated; but they relate to matters at present under legal discussion, and, therefore, perhaps it would be better not to allude to them.

The Commissioners wish you would have the goodness to state what those inaccuracies are?—Why, really, it is difficult, from the very short view I took of the Report, to do so.

Could you not, in substance, mention any remarks which you may have to offer, in order to explain the inaccuracies to which you allude?—Not easily, without my notes, which I took at the moment; but they related entirely to matters which are at present *sub judice;* with respect to the power of the Senatus, which they claimed and have exercised, there are several inaccuracies.

Have you those notes with you at present?—No, I have not.

What would you wish to remark upon the third answer?—That several interferences of the Patrons, in respect to the regulation as to Graduation and College Discipline, have been totally overlooked and disregarded, particularly the transactions of 1703 and 1704.

What are those transactions to which you allude?—Relating to, the discipline, to the laureation, for example, and to the laws and regulations of the students, and of their studies, and to the privileges of the Professors. They were summoned before the Patrons, on account of their having assumed powers to which they were not entitled at that period, in 1703 and 1704. And again, if I recollect correctly, about 1736 and 1737, there was also an interference by the Patrons, vindicating their rights to regulate the whole affairs of the College.

Does your observation under this head apply merely to that having been left out in the Return?—Yes; it alters entirely the view of the subject, or would make a change in the answer.

Is there any observation you would be desirous of making on any other answer?—There is an inaccuracy in respect to the Faculties, but it completely corrects itself.

What is that inaccuracy?—It says, the Senatus Academicus claimed the power of instituting Faculties; yet previous to that, it specifies that there are no Faculties which have any privileges, or something to that purport; it appeared to me to be an inconsistency, or that the one corrected the other.

Do you recollect any thing, in the notes to which you have referred, that you are desirous of communicating to the Commissioners?—No; I did not think it necessary to make out a list of what appeared to be inaccuracies, as I trusted to the papers of the Town-council explaining them.

University of Edinburgh.

Professor Hamilton, junior.

2 November 1826.

Independent of correcting any inaccuracies, are there any observations you would wish to suggest to the Commissioners, with regard to the University in general, previously to taking into consideration your own particular class?—I certainly think that both the Literary and Medical department require some alterations.

Will you, in the first instance, have the goodness to suggest any alterations you wish, as to the Literary department?—It appears to me, the young men who attend the literary classes are not obliged to follow any particular course of study, which must be extremely injurious to their acquisition of knowledge. I think I can almost explain that there is a great difference between the students who attend the literary classes, and the medical students. The literary students are natives of this place and the adjoining counties; they come from school, and neither they nor their parents can be the proper judges of the best mode of conveying Academical instruction to them. In every other well regulated University, the course of study is prescribed; for example, no student at St. Andrews is allowed to attend Logic, the first year of his attendance at the College. The consequence of the want of such a regulation here, is, that we seldom send away good scholars from this University; most gentlemen who wish to give their sons a liberal education, send them to private tutors, or to some seminary, after leaving College.

Do you think that deficiency arises, in a considerable degree, from there not being a course of education prescribed?—Very much. I can give one or two strong proofs of this. There was not a more eminent nor more zealous teacher, ever in any University, than the late Professor Dalziel: his lectures, which he read to his pupils, have been published since his death; and they could scarcely now be delivered to the boys of the fifth form of an English school. He was obliged to accommodate his lectures to the capacities of his hearers. I had a still more interesting instance of it individually, in a young man in whom I was very particularly interested. He acquired all the first prizes here for Languages and Mathematics; and the late Professor Playfair came to me, and requested that I should give him an English University education, in consequence of his acquirements. I did so; and he found himself below all the Freshmen of his years in Trinity College, Cambridge. It required thirteen hours' study a-day, for two years, to make up for his deficiencies, which he did; and he acquired a Fellowship accordingly.

How long had he attended this University?—I suppose four years. He had the prize for Mathematics, the prize for Greek, and the prize for Latin, and the prize for Latin poetry.

Do you think that, besides the want of a course being specifically prescribed, there must be something else vicious in the system of the University of Edinburgh, to produce such consequences as those which you have just mentioned?—Probably the students are sent too young.

Do you recollect at what age this young gentleman, to whom you have alluded, was sent?—At fifteen, I think, as far as I recollect. He was nineteen when he went to Cambridge; so that, I think, just makes out the four years: but there have been several young gentlemen who have gone since then to Cambridge, under similar circumstances, who have not made any progress. They have despaired, and given up; and it may be further mentioned, that when this young gentleman showed Professor Playfair the Mathematical exercises which the Freshmen of Trinity College, Cambridge, had gone through, and the questions which they had answered, he declared that there must be some trick in the matter, until he was convinced, upon very full investigation, that the knowledge was fairly and painfully acquired.

Do you think it would be an improvement in this University, by any arrangement or regulations that could be devised, to take care that young men should not attend the classes here in Literature, until they have arrived at a certain degree of proficiency in their several pursuits; so that, in commencing their University career, they should have a certain stock of learning *previously to entering*?—There is no other than refusing students under a certain age, and that would be very inconvenient to the majority of the parents of the students here.

Do you think that the inconvenience which would arise to the parents here, to which you allude, or the evil which arises to the education of the children, by the existence of the present system, the more objectionable?—It is extremely difficult to answer that question; there are a number of young men, who make up at a future period for the superficial education they get when they come first to this University, and all young men of true spirit and moderate talents do so; and many of them attend the Logic and Ethics afterwards, at a future period of life; many of them learn Mathematics subsequently to leaving this University, and after having been at a profession.

Do you not think that if pupils were prohibited from entering the University until they reached a higher age, the consequence of that would be the establishment of a better order of schools throughout this country?—Certainly. In Trinity College, Cambridge, they do not receive any young man without his being previously examined by a Fellow; and a testimonial of his qualifications to go through their course of study is given.

If a better order of schools were the consequence of such a regulation, would not the inconvenience which parents would meet with, in consequence of a change in the system, be removed?—Decidedly.

Do you conceive that fifteen is too early an age to enter the University?—In England they do not receive them so soon by a great deal; it is not customary there.

Do not many enter here much earlier than fifteen?—A great many.

Do you understand that a considerable portion of the young men at the Language classes enter below the age of fifteen?—I should rather think so from what I recollect; but I have not been attending to it lately. I was so satisfied with the first experiment, I did not make a second; my son was educated altogether in England, so that I have had no opportunity of making inquiries since.

Supposing a better order of schools were established in this country, and consequently that the necessity for such young persons coming to the University for these branches of education

was done away with, should you think the age of fifteen too early for a young man to enter College?—I think the age of fifteen might do, with a very good foundation of Latin and Greek.

Do you think, in point of fact, that the University system is adapted to boys of an earlier age than that?—I should think not, for they are left at liberty very much. There is only a paltry fine to pay, or something of that kind; but there is no compulsion upon them for getting their tasks; and when I inquired into it, I found there was scarcely any emulation.

Do you think it possible to induce most boys of that early age to study, without the stimulants of apprehension on the one hand, and reward perhaps on the other?—It depends very much, I should think, on the method of teaching.

Does it occur to you, as an inconvenience in the present system of teaching such young boys, that the session is so short, the whole summer is a vacation?—Certainly; every student who has not a private tutor during the summer, must lose what he has got during the winter.

But if the system could be altered, do you not think it would be better that the branches of elementary education should be taught and learned at schools rather than at the University, with the discipline that might be annexed to a school, rather than with the imperfect discipline which can only be followed at a University?—Logic and Moral Philosophy, I suppose, could not be properly taught at schools. As to Languages, no doubt it would be better if they were taught at schools, but not the very higher attainments in Greek and Latin.

Supposing the Professors did not teach the elementary branches of Greek and Latin in the University, would not some time necessarily elapse before the establishment of such schools, as have been supposed in the previous question?—I understand that they have improved very much in the mode of teaching in the High School, and the lower schools, particularly in the teaching of Greek, which must save the Professors a great deal of drudgery. When I attended, the Professor taught us the alphabet.

Without referring to the High School, but to schools in the country generally, would not a considerable time elapse before so material a change could take place, as that which has been supposed in the question that has been put?—I am not competent to judge of that, as it has not been brought particularly under my observation. I understand that in many branches there is a great improvement in teaching of late years; but in the schools here, the object is, to teach what is immediately useful, and not ornamental; therefore, they never go to the depths of languages in schools.

Is Dr. Hamilton aware that of late years, since the improvement to which he alludes has taken place in the system of teaching schools, the number of those attending the first Greek class has nevertheless considerably increased?—I have had no opportunity of knowing that; I dare say it may be so.

Would you wish to offer to the Commissioners any further remarks upon the Literary classes?—No.

Have you any thing to suggest as to the degree in Arts?—No; I think, that if there were proper encouragement held out for the degree in Arts, it would be taken as a literary honour, and contribute very much to encourage young men to study: it is quite neglected here, whereas it is an object of great interest in the English Universities.

Would you therefore wish to see established a system of public examination, at the end of a session, or some particular period to be fixed, where what are called, in the English Universities, honours might be granted, or a classification might be made?—I think it would be a very great improvement, if properly conducted.

Would you wish to see the degree of Master of Arts, in consequence, much raised in the public estimation?—Decidedly.

Do you think that would have a beneficial effect in this University?—In time.

Having stated these observations, with relation to the Literary classes, would you have the goodness now to proceed to offer any which may occur to you, regarding the Medical classes?—The first circumstance that strikes me, which requires alteration and improvement, is the mode of examining for Medical degrees.

In what respect do you think that faulty, or how would you improve it?—I consider it to be equally injurious to the students and to the public, and likewise inconvenient to the professors.

In what respect?—The examinations are in Latin; they relate to a great variety, and, we may say, an indefinite variety of subjects; the young men occupy the last year of their study, almost exclusively, in getting by rote certain questions and answers in Latin, from certain private tutors, who are vulgarly called grinders; the consequence of which is, that from the middle of the session every year, all the young men who are to graduate that year desert the classes, and lose half of their studies that session.

Is that the case, without any exception?—There may be exceptions, of course, but there is a prodigious diminution of students, from the 1st of February, in every class.

How would you obviate that objection?—By following the same mode of examining as at Trinity College, Cambridge, and Trinity College, Dublin; which is, by collecting the young men in the hall, placing before them certain questions printed under secresy, and requiring them to answer these on scribbling paper, in writing, within four hours each day.

Would you have those queries in Latin or English?—Partly in both, as in those other Universities. I have brought with me the account of a medical examination for a Bachelor of Medicine at Cambridge, which must convince certainly every competent judge, that by a method of that kind the qualifications of the candidate can be truly appreciated, without much trouble to either party.

Are those examinations in Latin or English?—Partly in both. I have the account here, which a gentleman sent to a friend without his knowledge that it was ever to be used; that

University of Edinburgh.

Professor Hamilton, junior.

2 November 1826.

gentleman sent it to me, and it is a most perfect specimen of the mode of examination. It is dated in November :—

"Your letter arrived on the day I set off to Cambridge, to submit to a professorial examination *ex Cathedrâ Medicâ*. I returned to London on Wednesday night; and as you may like to know something of Cambridge Medical trials, I shall give you the questions. An under-graduate was my colleague, candidate for M. B. degree. The Professor Haviland gave us, on the first day, each a paper, containing the following questions:—1st. What Arteries are given off by the Aorta on its passage through the Abdomen? 2d. Describe the structure of the Kidney? 3d. Describe the Ciliary Ligament and Petitian Canal? 4th. What is the nature of the Bile? What are its uses in the Animal Economy? 5th. What is the composition of Biliary Calculi? 6th. Describe the descent of the Testes in the Fœtus? 7th. From whence does the Gustatory Nerve take its origin?

"After giving answers to these questions on paper, we had to translate ten Aphorisms of Hippocrates, beginning at the 20th in the 4th book.

"On the second morning, he gave us the following:—1st. What are the general symptoms which indicate the presence of Fever? 2d. Describe the principal symptoms of Hydrocephalus Acutus; what is its predisposing and exciting cause, and what is the proper mode of treatment in this disease? 3d. In what class does Bateman place Psoriasis? 4th. What is the proper treatment in Cholera Morbus? 5th. What is the nature of Fusible Calculus? 6th. What symptoms are produced by taking Hydrargyr. Oxymurias as a Poison, and what tests show its existence? 7th. How is Hydrargyrum Precipitatum Album produced, by the directions of the London Pharmacopœia?

"Translation of a part of the third Book of Celsus.

"I think this was a very fair examination, embracing a good deal, and sufficiently trying without being vexatiously puzzling. The Professor was pleased to say he was very well satisfied with the result. I go down again on the 22d November, with my Thesis; and, on the subject of it, he will give me a paper of Latin questions or objections, to be answered in Latin; and I then get my degree on the 24th.

"At the end of two years, and not before, can I get my licence to practise, from the University. For this licence, I have again to be examined; and it is only on presenting myself, with this licence, before the College, that I can claim to be there examined as an Inceptor Candidate, and it will only be then that I shall be really entitled to take a fee, if I can get one."

Do you consider what you have stated to be a more strict examination than a student undergoes here for the Medical degree?—It must be; for it embraces both practice and theory in every part of the profession: it sifts a man most completely.

Are they not completely sifted here, without having notice of the questions that are to be put to them?—There is some difficulty when questions are put in Latin, and the answers in Latin, between Scotch and English. If 120 candidates are examined individually, many of the questions must be repeated, how much soever the examinator may wish to vary them; and a young man, who has been four years at this University, can learn from his companions, from the beginning, the questions that were asked of them; and he gets it by rote, and forgets next year everything he has said; and a great many of the graduates here study after they have got their degree—they actually attend classes, to learn what they could not do when they were under the anxiety of grinding, or preparing for a degree. Now, by an examination of this kind, we secure knowledge. No man can possibly say, whatever may be the talent of the teacher, that his pupil is to be able to recognise measles, or scarlet fever, or the small-pox, or the chicken-pox, if he is brought into a sick room; but he ought to be able to tell the distinction before he goes in. By a method of this kind, the whole graduates could be passed every summer, in the course of three or four days, with a perfect certainty that they had attended to their studies, and without the possibility of its being alleged that there was partiality; for the examiners would previously settle that every question should have so many marks. Thus, every person answering questions, amounting to so many marks, would be entitled to pass. Hence, the candidate goes in with a certainty that neither A, B, nor C, can take a prejudice against him, or puzzle him; there he is, with his scribbling paper before him, and instead of having an inducement to stay away from the classes, he is induced to attend and take down notes, and study every subject that is prescribed for him; and the improvement, in consequence of the new mode of examining at Cambridge, within the last twenty years, and in Dublin, is incredible. With respect to the acquisition of knowledge by the candidates, the Commissioners will find that stated in Lardner.

Is Dr. Hamilton aware, that a very great improvement has taken place at Oxford, in the course of the last twenty years, as to its system of education?—I have heard so.

Were those questions, which were referred to in the letter that has been read and given in, previously known to the students?—Not at all, until they entered the Hall for examination; and the examinators are bound, under an oath of secresy, to communicate them to no man. One of the Fellows is a superintendent of the press. I have a collection of the Cambridge Calendar for the last ten or twelve years, since my family has been connected with the Trinity College, and the improvement in the Greek and Mathematical knowledge is incredible.

If the examinations in this University, for candidates for Medical degrees, were conducted in English, would you not consider that to be superior to the method pursued at Cambridge?—Certainly not. I still object to *vivâ voce* examinations.

Upon what ground would you object to them, if they were conducted in English?—Because many young men get so embarrassed, they cannot recal to their memory what they have learned—they lose their memory completely when under *vivâ voce* examination; whereas, if they have pens, ink, and paper, and are left to themselves, they have time to recollect. Besides, it has been alleged, I do not know with what truth, but it has been stated, that a number of young men have received the Medical degree here, who could not write English. Now, by making them write their answers, that would be prevented.

Does not Dr. Hamilton think, that a *vivâ voce* examination affords the means to the exa-

University of Edinburgh.

Professor Hamilton, junior.

2 November 1826.

miner of a much more complete and varied inquiry into the qualifications of his students than the other mode recommended by him, supposing always that the young man was sufficiently master of himself to answer?—*Vivâ voce* examination would be more favourable to a candidate, in one respect, that the Professor would have it in his power to break down his question into two or three parts, to find if the student really had the knowledge or not; but, on the other hand, there are so many conveniences from printed questions and written answers, that I should certainly prefer that method in every respect.

Might not a combination of both systems be better than a rigid adherence to one or the other; much, of course, being left to the discretion of the examining Professors?—It might. It is so in the early classes in the first and second years at Cambridge; it is partly *vivâ voce* examination.

Are there any other objections which you have to the mode of examination for the Medical degrees in this University which you can state?—Yes; I consider the preliminary education of the candidates is very defective.

Do you mean the preliminary Medical education, or education generally?—I mean preliminary general education.

Are you therefore desirous, that previous to graduating in Medicine, persons should have a more enlarged general education than they are now bound to possess?—Certainly. I consider no man, for example, can understand Anatomy or Chemistry, without the elements of Geometry; and no man is fitted to reason upon a disease, who has not acquired a sufficient knowledge of Logic. The languages, of course, Greek and Latin, are of the greatest importance.

Do you affix any importance to the knowledge of the Greek language?—Decidedly; all our terms are from the Greek.

Are there any other branches of literature, besides those you have mentioned, which you deem essential to a person, previous to taking the Medical degree?—I consider the various branches, taught under the name of Natural Philosophy, should be most completely known to the graduate.

What alteration would you make on the prescribed course, looking to it with a view to an additional course; or, is there any retrenchment that you would propose?—With respect to addition, I consider, that in this University, we want very much a Professor of Surgery, who is in actual practice, who really uses the knife, and attends Surgical patients to teach the phenomena of Surgical diseases; because I consider that no Physician can practise with safety, who does not know the phenomena of Surgical diseases, and who has not had a general idea of the mode of treating them.

Would you then make the Professor of Surgery distinct from the Professor of Anatomy?—Decidedly.

Do you think any of the Chairs, which are not now added to the Curriculum for the Medical degree, should be added to it?—It is very difficult to answer that question; because, the students here are upon a very different footing from those in many other Universities, and it must depend altogether on the view of encouraging or discouraging Medical graduation. The late Dr. Monro, with whom I was for many years intimate, agreed cordially with myself, that honours should not be made too cheap, and that we ought to discourage Medical degrees as much as we possibly can. It appears, from the practice lately, that a different notion now prevails; and the consequence of it is, that certainly the honour has become a little too cheap. There are a great many individuals in Edinburgh, who have "Dr. ——— ———, Surgeon," upon their door. No such thing could happen in England; no person, who has the degree of Doctor of Medicine, from a University in England, would practise Pharmacy and Surgery. In contemplation of coming here, I looked over the list of our graduates since I was appointed Professor, which is twenty-six years, and I think there are 600 Scotch, 627 Irish, and 500 English. Now, a very large proportion of Scotch and Irish are poor men, who cannot afford to pay what is absolutely necessary: it is with difficulty it is scraped together; they sink their degree; they go into the Army or Navy as Hospital Mates and Surgeons' Mates; they take up laboratories in different quarters of the kingdom, or keep druggists' shops, with the degree of M.D. in their pocket. That is destroying the proper distinction there ought to be; and the more classes a graduate is obliged to attend, previously to getting his degree, the more will its respectability be secured. I have always considered that a medical man who is in difficulties and straits, has temptations, which not many can resist, to become a rogue—much more so than in any other profession. I would have none admitted who had not the education and principles and manners of a gentleman; consequently, everything that can add to the difficulty in taking the Medical degree at this University, I consider useful to society, as well as tending to the credit of the University.

Does Dr. Hamilton think that, in order to make the Medical degree what, in his opinion, it might be in this University, attendance on the class of Medical Jurisprudence ought to be added to the Curriculum?—I have had to express my opinion on that subject, and I will furnish the Commissioners with my observations upon it. In answer to that question, I would say not, if the candidate has attended the other classes, which I should consider necessary classes; for, in every particular department in which Medical Jurisprudence can be useful, in this part of the world, better information might be got from individual Professors, certainly, than can be given in the general course. I would not say that the course is not useful, but I do not think it should be imperative upon a graduate. For example, he gets from the Professor of Anatomy the signs by which he can distinguish strangulation from drowning or hanging, much better than he can get from one who has to refer to previous Anatomical knowledge: the Professor of Anatomy has the organs before him; the student is taught the structure, and he can easily comprehend the derangement, with its different causes. The Professor of Chemistry,

University of Edinburgh.

Professor Hamilton, junior.

in the same manner, must show the deleterious effects of metallic oxydes, and the tests by which these may be distinguished. The Professor of Midwifery can show the marks by which the violation of chastity, abortion, child-murder, and a number of other cases, may be distinguished, better than a man who has not been in practice at all. For example, there are questions before courts of law, every now and then, respecting the age, after conception, at which the infant is thrown off: that can only be explained by a teacher of Midwifery, who has preparations before him, who has embryos, from the moment they are visible, up to the period they are capable of living independent of the parent. At the same time, I think it is a very useful thing to have a general view of all those subjects brought back to the recollection of the student.

Do you think that attendance on the classes of Military and Clinical Surgery, one or both of them, ought to be required in the Curriculum?—There can be no doubt whatever, with respect to Clinical Surgery, that it ought to be added. If I were breeding a son of mine to Physic, I should teach him Surgery before Physic; for the phenomena of surgical diseases come under observation. A Clinical Professor of Surgery has it in his power to direct young men to the knowledge of those phenomena to which he should attend; it is one of the most important courses of lectures I know.

If there were a Professorship of Surgery established in the University, and rendered imperative, would you still exact attendance on the class of Clinical Surgery?—Most undoubtedly.

What would you say as to Military Surgery?—With respect to that, one can scarcely believe how much one branch of the Medical Profession illustrates another: in the lectures of the Professor of Military Surgery, there may be a number of very important facts, with respect to wounds and bruises in battles, which may suggest to the practical physician a great deal of important information. At the same time, as the Professorship is for a particular set of students, those who are to be attached to military duties, perhaps it might be thought hard at present to make it imperative, except by way of recommendation.

Should you think it right that Natural History should be added to the Curriculum?—Certainly.

Looking to the wish, which you have expressed, that every Physician, upon acquiring his degree, should have been educated in general literature, as well as his own profession, in a superior manner, what other classes in the Faculty of Arts, besides Natural History, would you recommend to be added to the Curriculum, and made imperative?—Natural Philosophy certainly, Logic certainly, and Mathematics of course: no man can doubt that.

Did the Commissioners understand you to say, that it was a proof that the young men who take degrees here were not sufficiently educated, because, after having taken their degree, they very often went to other places to complete their studies?—They do not go to other places; but they often attend here a year or two after.

You stated, that at Cambridge, after the young man had got his degree, a certain number of years must elapse before he could get his licence from the College of Physicians; do you know if the intermediate time is occupied in improving himself, by attending other places?—Clearly.

Is a Bachelor of Medicine, in the English Universities, entitled to practise?—After he gets his licence, which is two years after he gets his Bachelor's degree.

May he have that before he is Doctor of Physic?—Yes, several years; but he must have been eleven years at the University, from the time of his entering, before he gets his degree of Bachelor of Medicine.

Is it your opinion, that in order to qualify a gentleman to become a Doctor in Medicine, he ought to have had a thorough previous education, both literary and scientific?—Yes; he should have a liberal education, in every sense of the word.

You have adverted to a circumstance, which you say is common in this country, of gentlemen with Medical degrees sinking them, and practising as Surgeons, and often as Apothecaries; is that very generally the case?—Pretty much so.

Would no practical inconvenience take place, if that system were to be very extensively or suddenly interfered with?—None; for I consider the Medical Degree as merely a literary distinction: it is not, at present, in estimation with the world, as marking a man's qualifications to practise Physic. Considering those upon whom it is conferred, it is looked upon as a mark that a man has gone through his academical exercises; but it is no evidence of his talents as a Physician at all.

Does it not afford an evidence, that he has passed the examination necessary for taking the degree of Doctor in this University, and that he has a very competent knowledge in the art he professes to practise, and which evidence he could not easily give, except by having taken it; and does not that ensure a set of very competent practitioners generally over the country?—I cannot say that; for there are so many who practise in the lower departments, who never mention their degree, after they have had it. It is only lately they have put "Doctor" and "Surgeon" on their doors; there never was an instance of that sort, until within these three years, but now it is beginning to be fashionable: the public have made up their minds; but still there are a number of young surgeons, who have originally graduated at this University, who put "Mr." on their doors.

Can a gentleman who takes his degree of Doctor of Medicine, practise as a Surgeon, unless he has passed as a Surgeon?—Yes, he may: by a new regulation of the College of Physicians, they admit a graduate of Edinburgh to be one of their Fellows, though he practise Surgery; and he may practise Surgery under their licence, without belonging to the College of Surgeons; there are a great number who practise Surgery in Edinburgh, unchallenged, without belonging to either College at all.

Are there not some such persons in great practice?—There are several men who are in

very popular practice, who belong to neither College, and were not in the Army or Navy; they are cheap practitioners, who go through a great deal of business, and one or two of these men have carriages.

Although you object to a graduate of the University practising as a Surgeon, yet, at the same time, is not a better education thereby secured, than if he were allowed to practise upon the inferior diploma of a Surgeon, or without having, perhaps, any licence at all?—The College of Surgeons have required more qualifications from persons passing before them, than the University of Edinburgh have done, and a greater range of study.

Do you mean the College of Surgeons in Edinburgh, or all the Corporations of Surgeons?—The College of Surgeons in Edinburgh I can speak of positively. Within these twenty years they have, in an extraordinary degree, extended the knowledge required for their candidates whom they pass.

Do you know if the same is the case in the College of Surgeons in Glasgow?—I believe so; and also in London.

In what particulars is the course of study, prescribed by the College of Surgeons, more extensive than that which is required at the University of Edinburgh, for graduation in Medical degrees?—They make all the same classes necessary for their diploma which the College of Edinburgh direct for the degree; and, in addition to that, they make them attend Practical Surgery, Clinical Surgery, Dissections, and they generally require longer attendance upon an hospital also, than has hitherto been required by the University here; and they are very particular with respect to the preliminary education.

Is any preliminary education actually required?—No; but they put questions, and make them read Latin before them, to secure the knowledge that they have got a literary education.

Is there any examination as to the attainments of the candidates in Greek?—I do not believe so.

For what length of time is attendance on classes required by the College of Surgeons?—I do not recollect precisely just now, but it strikes me that they are fully as long as those of the graduates of the University here; they generally have served an apprenticeship for a certain number of years, but I cannot charge my memory with that.

Do you consider that an apprenticeship is an equally good mode of acquiring knowledge, as attendence at the University?—I consider it to be quite invaluable, and there is not one day in my life I do not feel thankful for having served a regular apprenticeship; it makes one, at an early period, conversant with the phenomena of disease, and acquainted with the number of little trifles of great importance to the comfort of the sick, which cannot be taught from a Chair in the University; and in particular, it makes one ready in knowing the doses of medicine, and the form in which they can be retained upon the stomach, and so forth.

Do the College of Surgeons take apprenticeship as a sufficient qualification, without attendance upon classes?—Not at all; they enforce all the attendance fully the same in the event of apprenticeship; I believe they spare them one year, that is all.

How are the examinations conducted by the College of Surgeons?—*Vivâ voce;* but at the same time they have Celsus and the Pharmacopœia before them; and they make them read a few sentences, if they feel it necessary, out of some part of Celsus; and they take up the Pharmacopœia and make them translate it, to be quite satisfied of their knowledge in making drugs, and reading physicians' prescriptions.

Are the examinations in Latin or in English?—In English.

For what length of time does the examination last?—About half an hour, I fancy. Unless a young man is very stupid, they find out in half an hour what he is. Accordingly, they pass eight or ten in three or four hours, as I understand. I speak, however, generally, for I have no precise information.

Are you aware if many persons practise in the country in Medicine and Surgery, who are merely Apothecaries?—No.

Is not that the case throughout Scotland?—In general, there are four counties in the West of Scotland, where the Faculty of the Physicians and Surgeons of Glasgow have control; and they allow no man to practise without their licence.

Is there any control enforced in any other part of Scotland?—Not that I am aware of; but public opinion does a good deal in that respect. There are few men who now practise without a licence.

Do you consider, in general, that the education upon which persons practise as Surgeons throughout the country, is fully equal to that which is received by the person having taken the degree of Doctor at this University?—Whenever gentlemen practise with a licence of the College of Surgeons of Edinburgh, I can say, I consider their education and qualifications to be fully as well established as by a Medical degree from this University.

In addition to the class of Clinical Surgery, what are the other alterations by which you would propose to raise the value of the degree of Doctor of Medicine?—I have mentioned already the course of Practical Surgery. I am quite satisfied of the importance of having a separate Professor of Clinical Medicine, instead of having that taught by different Medical Professors, according to the present system.

For what period would you enjoin attendance upon the Professor of Surgery or Clinical Medicine?—The usual term is six months at least.

Is there any other alteration by which you think your object could be accomplished, of raising the degree?—I have always considered, that first a Bachelor's degree should be granted; and afterwards, upon a man showing that he has been a moral and an industrious and respectable practitioner, he should get his Doctor's degree at a future period, as they do at Cambridge, Oxford, and other Universities.

After a second examination, is a distinction conferred according to his existing character

University of Edinburgh.

Professor Hamilton, junior.

2 November 1826.

and practice, or is it given as a matter of course?—I should propose that he ought to begin with his Bachelor of Medicine's degree; and, after two or three years, that he should produce a proper testimonial of his character as a man and as a practitioner; and that then he should have the degree as a matter of course.

If a degree were so granted, as a matter of course, upon testimonials, would it not become like the degree formerly given in St. Andrew's and Aberdeen?—No; for they have already taken the degree of Bachelors of Medicine, and gone through all the necessary examinations and studies.

If a Bachelor's degree is to entitle him to practise, and the degree of M.D. is afterwards to be given to him upon testimonials of good character, what is the use of the further degree of M.D. to the public?—The degree of M.D. stamps the character; but if it be given at first, it cannot afterwards be withdrawn. Now, when it is given to a man of twenty-one years of age, it is impossible to know whether he is to become a respectable member of society or not. For example, when I studied here, a young gentleman, of the most unexceptionable character and excellent acquirements, took his degree; he began practice with a very handsome patrimony, and he finished his career as a ballad-singer in the streets of Dublin. Now, if that man had been Bachelor of Medicine first, at the end of three years he never could have been made a Doctor of Medicine, for the testimonials in favour of character would have been wanting.

Is it your opinion that, according to such a system as you propose, it is likely the degree would ever be refused?—Decidedly, where a man's character was notorious. When I was President of the College of Physicians, Dr. Brodum was understood to intend petitioning to be made a Licentiate; and if he had produced his degree from Aberdeen, (which he had actually got,) I meant to have made it a question before a court of law, whether we were bound to license a notorious quack. I got leave from the College to do so, but fortunately the man had lost his diploma, and the University of Aberdeen would not grant a certificate of having given one.

There being no Faculty of Surgery here, is there any diploma for Surgeon granted by the University?—No, for there is no practical teacher of Surgery.

If there were a practical teacher, would you think it of advantage that such diploma should be granted?—No, it would interfere with the vested privileges of the College of Surgeons, who have a charter empowering them to grant licences for Surgeons.

Supposing there were no such impediment, would it be advantageous for the public and the profession in general?—No; I consider the College of Surgeons of Edinburgh have established most admirable regulations for the studies and qualifications of their candidates; they have improved them almost annually for the last twenty years.

Upon that account, does it supersede the necessity of granting such a diploma in the University?—Yes; they have got a Museum, and every thing that can be desired to qualify a surgeon.

Dr. Hamilton, having stated that in many respects public opinion operates as a compensation for the want of authority, which may be exercised by Medical Corporations or Universities, with respect to persons practising; does he confine that remark to greater towns and communities, or does he make it generally, with respect to the whole country?—Generally speaking, now-a-days, the public require some testimonials of a medical man's qualifications, before they employ him; and accordingly, in almost every part of the country, men who have not served in the Army and Navy, produce a licence from the College of Surgeons of London, or Edinburgh, or Dublin, or the Faculty of Physicians and Surgeons in Glasgow.

Is it not notorious, in almost every part of the country, that the common people, upon whom the practice of a country practitioner so much depends, give a constant preference to an ignorant and illiterate quack, over, perhaps, a respectable practitioner?—I have no opportunity of knowing that, I am so complete a resident in town.

In speaking of preliminary education, you said, as a matter of course, you would require a knowledge of the learned languages; do you consider a reasonable knowledge of Greek essential for a surgical practitioner?—I consider a surgeon can scarcely recollect the names of the different parts of the human body, or the names of many diseases, without a knowledge of Greek; but still, by means of a good memory, a surgeon may not require to have a knowledge of the Greek language; but a physician is different: there is not a study in which the physician is engaged, in which he does not meet with some word of Greek origin. In consideration of that, I last night looked over one of the little French Dictionaries upon Medicine. I saw above 2,000 words that are radicals of the terms that are used in Physic and Surgery. Then, with respect to Botany, no man can learn Botany without a knowledge of Greek, if he have ever such a memory. I should suppose that is impossible. Besides that, as I have stated already, a Physician should have the liberal education of a gentleman; and Greek, of course, is one of the most essential parts of it, in the present estimation of the world.

Are you aware of any evil or inconvenience, which would arise to the public, if a competent knowledge of Greek were required absolutely, before the granting of the degree of Doctor of Medicine?—Not in the smallest degree,—not by the possibility of conjecture.

Is a knowledge of Greek generally required by the foreign Universities?—In all, according to my belief.

Will you mention some of them?—I do not recollect; but if there had been any exceptions I should have remarked them. When I attended the classes here, I think that one or more Aphorisms from Hippocrates were always written upon by the candidates for graduation; but that is many years ago.

Do they give it out in Greek?—Yes, I think they do; but I may be mistaken on that point. There may be a change now; but I believe that it is so in all foreign Universities.

Will you mention some of them?—I do not recollect. I do not know an exception. There

University of Edinburgh.

Professor Hamilton, junior.

2 November 1826.

is an article in the *Dictionnaire des Sciences Médicales* respecting medical education, where there is an account of the different qualifications required in different Universities; and it would have struck me very strongly indeed, if I had seen a knowledge of Greek omitted.

Do you speak rather from impression than from any positive knowledge you have of the practice in them?—Yes.

In respect to Greek, do you consider the regulations of the College of Surgeons to be defective?—I consider that a man may be a very good Surgeon without a knowledge of Greek; I do not say that he may be a Physician without the knowledge of Greek. I suspect that the apprentices are obliged, like the apprentices to the Writers to the Signet, to attend both Greek and Latin.

Did you not state that the College of Surgeons did not require any previous knowledge of Greek?—I cannot say that I was stating that; I considered a man might be a very good Surgeon without a knowledge of Greek, for if he has a good memory, he will remember the terms; but he could not be a proper Physician without it.

In a former question you were asked whether the College of Surgeons required any knowledge of Greek; did you not say they did not?—They did not when I knew about them; I rather think they did not; but I speak that again without positive information.

If, in your opinion, it is only a person who has a remarkably good memory, if a Surgeon, who is likely to remember the names of the different parts of the human body and diseases, which a Surgeon meets with, without a knowledge of Greek, would it not seem, that for the generality of people, who take the licence from the College of Surgeons, a knowledge of Greek is as necessary as for Physicians?—Most generally it is, and it saves a great deal of trouble in recollecting; it saves the memory very much.

Do you consider it to be necessary for a Physician to be able to read the works of Hippocrates in the original language?—Yes; any Physician who goes abroad, should be able to do so, for he would appear very illiterate on the Continent if he could not.

Would you wish, for the sake of the science in this country, that he should be able to do it, and that it should be necessary to make a Physician what you think he ought to be?—He ought to have a competent knowledge of Greek; I do not say he should be a perfect Greek scholar.

Is there any considerable number of books in Greek, which are of use for a Physician to study?—They are all so admirably translated, that no Physician in this part of the world thinks of consulting the original.

Supposing regulations were prescribed, by which such a previous literary and scientific education as you desire to see, were secured, would you propose that the examination of the candidates, in regard to such previous education, should take place when they commence their medical studies, or when they apply for their Medical degree?—I should say that it ought at the time they apply for their Medical degree, taking the students as they present themselves here; but if we had the choice of students, I should allow no man to have a ticket from a Medical class who had not had a competent previous education; but, in the present state of this school and society, it is impossible to enforce that regulation.

Looking to the period of time during which medical studies must be pursued, of four or five years, and the close application, with which, it is understood, medical students generally apply themselves to professional pursuits, is there not a considerable risk, that a person, who was a tolerably good Greek scholar, when he commenced his medical studies, may have lost much of it in the intermediate period before taking his degree?—No, that is impossible; for he cannot read two pages of a truly scientific book, either upon Anatomy or upon the Practice of Physic, without meeting with words of Greek origin, which would recal the language to his recollection.

Do you consider that that alone would be sufficient to keep up his knowledge of Greek?—It would, to a man who was previously well grounded in the language.

Would it be sufficient to enable him to pass an examination in Greek at the time of taking the degree?—Sufficient to enable him to pass all the examination that is required, and to read an Aphorism or two of Hippocrates, or a page or two of Aretæus.

Do you not think it necessary for most individuals to devote some time to refresh themselves in Greek?—Not more than they would employ for their Latin.

Do you think a perseverance in acting upon the system which you have described, as prevailing at this University, of encouraging the number of medical graduates, rather than discouraging them, may operate disadvantageously to this University, as a School of Medicine?—I should fear very much its operating disadvantageously; for every man who takes our degree, and practises in the lower part of the profession, is so far degrading our degree: it is literally a degradation.

Do you understand that the Medical Board in London give a preference, in promotion, to Army Surgeons who have taken the degree of M.D.?—I am not acquainted with the circumstance.

At what age do young men generally begin to attend the Medical classes?—Those who are inhabitants of the city attend a great deal too soon.

Can you state the age, generally?—Why, there were so many young men applying for degrees, under twenty-one, that a regulation was made, some years ago, that no man should have a degree until he was twenty-one, which is a perfect evidence of the youth of the native students; but we have them of all ages here.

Do you not think that seventeen is about the common age at which they commence their studies, when they mean to take their degree in four years?—Probably it may. The English and Irish students are further advanced; for they generally have all served an apprenticeship before they come here.

University of Edinburgh.

Professor Hamilton, junior.

2 November 1826.

How is it understood that their time has been generally occupied before they begin their attendance upon the Medical classes?—The inhabitants of Edinburgh, of course, have gone through the ordinary literary classes of the University; and those that come from Ireland and England have generally served an apprenticeship of five, or six, or seven years.

Might it not be quite practicable for a young man, before attaining the age of seventeen, to have acquired as much Latin and Greek, and the other fundamental branches of knowledge as are necessary, without incurring any very extraordinary expense?—Perfectly.

In the proposal you made, with regard to the introduction of a degree of Bachelor of Medicine, was it your understanding, that the degree of Bachelor ought to be fully equivalent to the present degree of Doctor of Physic?—No, an inferior degree.

Was it your understanding that a degree of education, fully equal to what is at present required for the degree of Doctor should be previously acquired?—Surely; the Bachelor should be required to attend all the classes necessary for an M.D., but should not get the title for a number of years after having got the Bachelor's degree, as is done in other Universities.

Do you mean then to say that the Bachelor of Medicine ought to have attended all the classes at present required, with the addition of those you have stated?—Decidedly.

What is the period of attendance which in that case you would require?—Four years.

Do you think the present classes, with the additional ones you propose, could be properly studied in four years?—Yes, clearly. I am quite satisfied, that if a sufficient knowledge of Mathematics, Natural Philosophy, and Logic, were acquired before attending any Medical classes, a prodigious deal of trouble and labour might be saved to the student.

Do you think it would be an improvement if the length of the Session were increased?—I am afraid, practically, that could not be done; as it is, there is great difficulty in keeping them on till the end of the Session, from the description of individuals that come here. I fancy very few gentlemen here have any notion of the small expense at which the medical students live.

What do you suppose is the expense of a student in ordinary circumstances?—I suppose very few of the Scotch and Irish have more than £30 to subsist upon, and pay their classes for the winter, and many not so much.

Do you suppose any considerable proportion of medical students leave Edinburgh after the winter Session is over?—Yes, and they generally run away early in April: they cannot stay longer; they have no funds.

Are not some of the Summer Courses imperative on the students?—Botany is: but that is for Doctors; no others.

Do they complain of being obliged to attend this Summer Class?—They must stay for their degree in August, and they are entitled to attend Botany that summer.

Is there any regulation enforcing attendance upon Botany during the continuance of the course, after the degree is granted?—It is over before.

Is the examination over before the attendance upon that class?—I do not know how that has been regulated.

May the examination by the Professor of Botany precede the attendance upon that course?—I understand so.

What are the considerations upon which that period of the year has been fixed upon for granting the degree?—I do not know. Formerly it was for the convenience of the students. The degrees were then granted at two different periods, and I rather think, that from the increasing numbers, for the convenience of the Professors, the change has been made; but I speak without knowledge, not belonging to the Medical Faculty.

Do you not now belong to the Medical Faculty?—I do not know. I am not sure upon that; I cannot answer that question.

Have you not been admitted by the Senatus Academicus?—Yes, but not by the Medical Faculty.

Have you ever required admission?—I have presented my Commission, and that is all.

To whom did you present it?—To the Senatus Academicus.

Did the Senatus accordingly admit you a member of the Medical Faculty?—No, they admitted me a Professor; they had no power to admit anything else. I consider my Commission entitles me to be admitted as a member of the Medical Faculty; but I have never been acknowledged as such.

Have you not been acknowledged as such by the Senatus Academicus?—I have been summoned to meetings, and things of that sort; but hitherto, every new member of the Medical Faculty has been made what is called Dean.

Have you ever claimed to be admitted?—No, I never claimed it, for it has hitherto been regularly granted without claim.

Have you ever declined to act as Dean?—I never was asked.

Have you ever declined to examine?—Yes, I have.

Were you required to examine?—In the first place, the Examination is a privilege and not a duty.

Were you asked or required to examine?—Yes, but in a very awkward way; I have brought the correspondence, that there might be no misunderstanding about that. The first year I was warned that their examinations would begin at a particular day, at three o'clock, which was my hour of lecturing.

If you were warned of the time when examinations would commence, on what ground is it that you say that you have not been acknowledged by the Medical Faculty as a Member, seeing that the Medical Faculty alone examine?—In the first place, their very announcement to me last year shows that they had already examined without summoning me; in the next place, I never was called to their private meetings to settle examinations; and thirdly, for a second time they made their hour three o'clock, at which I lectured, as they should have known.

University of Edinburgh.

Professor Hamilton, junior.

2 November 1826.

Here is a note I got on the 4th of April last; Dr. Alison stated, "Private examinations begin to-morrow, at Dr. Monro's, at three." To be sure, I put them in mind of it again and referred to my former note; I again repeated, "It seemed incredible the Medical Faculty should expect me to attend at the appointed hour, three o'clock, knowing, as they did, my public duty compelled me to lecture in College at that very hour."

Had that always been the hour for examination before?—Never, that I know of. Formerly they used to examine at seven o'clock at night, and at an hour in the morning; but they have had so many alterations latterly—I do not allege, nor do I think, it was done purposely; but it was an awkward thing, being done twice.

Was the hour of three o'clock first fixed, do you suppose, the year you were added to the Medical Faculty?—I do not know it; but it is clear it is their own choice, for I had a letter from Dr. Alison, regretting he had fixed that hour, and pleading forgetfulness that it interfered with my class.

Have you ever assigned to the Medical Faculty, as a reason why you would not examine, the existence of a certain dispute or lawsuit between the University and the Town?—Yes; I have stated that as a reason why I would not take part in the examinations.

Then, in point of fact, if you had stated that during the continuance of this dispute you did not intend to take any part in the examinations, was not the fixing the hour of the examination thereafter, so far as you were concerned, or the announcement of it to you, a mere matter of form and ceremony?—It was singular, and I should rather doubt that; for after this very note, which was expressed, I admit, with a little bad humour, a bundle of Theses was sent to me a fortnight or three weeks afterwards, to take my share of them; but I sent that bundle back unopened, stating, that, until I should know my privileges, I would not take a part in the examinations, and I hoped by that time there would be a better mode of examination fixed.

In point of fact, you having stated that during the continuance of that lawsuit, which is still in dependence, you did not mean to take any part in the examinations, the fixing such an hour was not the cause which deprived the Medical Faculty of the benefit of your assistance?—No, certainly not.

From what period is the attendance upon the class of Midwifery, as a part of the Medical Curriculum, to commence?—I cannot answer that question, because there have been so many changes in the regulations.

Have you read the last *Statuta Solennia*?—No, they were not sent to me.

Do the Senatus Academicus circulate the *Statuta* to all the different members, or do they purchase the copies when published?—They are not purchased; I know nothing more. I have not attended a meeting of the Senatus Academicus since they chose to alter the terms of my Commission; they insisted on putting in a word which is not in my Commission at all, and I just waited on them and took a protest against it, and I have never gone near them since.

Did the Senatus circulate copies of the *Statuta Solennia* to all the different members but you?—No; it may have been accident, they did not come; I do not suppose there was any intention to give me offence at all.

In point of fact, do they circulate the copies of the *Statuta Solennia*?—I understand they give the janitor a certain number of copies to distribute among all the candidates for graduation; and as to distributing among the members I cannot say.

Do you mean to say, that it is the fault of the Senatus Academicus or your own, that you are not aware of what is contained in the *Statuta Solennia* of the University?—Probably my own, I presume, for I have never seen them, nor inquired after them.

After the period when you may understand that attendance on the class of Midwifery becomes imperative, do you then mean to take a part in the examinations, seeing that a knowledge of that particular department is then required from every candidate for graduation?—That will depend very much upon circumstances; it is impossible for a man in extensive medical practice to devote three hours a-day, for ten weeks, which is at present the mode of examining candidates for degrees.

You stated that you considered your part in examination to be voluntary, and not to be a duty; upon what circumstances is that opinion founded?—Because, first, I have the privilege, but it is not imposed on me as a duty; secondly, I am not to get a share of the fees, and consequently it would be voluntary if I did any part of the duty.

When you state it as a privilege, and not a duty, upon what circumstance do you found that opinion?—Upon the terms of my Commission.

Is your Commission framed exactly upon the same terms with those of other Professors of Medicine?—I do not know; it gives me power to examine candidates for degrees.

Do you not know that your commission was carefully copied from the commissions of other Professors of Medicine, and is conceived in the same terms?—I do not even know that fact; but I understood that great care was taken in framing the terms of the commission.

Was it not your application to the Town Council that it should be made and conceived in the same terms as the former commissions of other Professors?—My application was simply to be made Professor of Midwifery, with the privileges of the Professors of Medicine.

Is it your understanding that, according to the terms of your commission, it is not a duty incumbent upon you to examine candidates at all?—It is a voluntary duty only at present, so long as I am junior member of the Medical Faculty.

Is it your understanding, as a Professor, that if the other commissions are conceived in the same terms as yours, there is no duty incumbent upon any of the Professors of the Medical Faculty to examine?—No. There is usage in that case. I wrote to the Professor of Glasgow in my department, and he said he did not examine, though he had the power to do it; for, as

University of Edinburgh.

Professor Hamilton, junior.

2 November 1826.

he did not participate in the fees, any objection he might make to the candidate might be misinterpreted by his brethren; and therefore he did not examine.

On what ground are you not to participate in the fees?—Merely that I might not interfere with the vested rights of other Professors. It was my own request to the Patrons, and they made that regulation specifically.

At the time you stated that you did not intend to participate in the fees, did you announce your intention not to take any part of the duty of examination?—No. I am ready to take the duty, if it be made such as a medical man in practice can undergo. No man in practice can spend three hours a-day, for six days in the week, and for ten or eleven weeks.

Did not Dr. Gregory do so?—There were very few candidates for many years after Dr. Gregory became a Professor, for there were only twelve or thirteen at each graduation.

From the nature of Dr. Hamilton's professional avocations, would it not be next to impossible for him to promise to devote himself to that duty, without an almost certainty of interruption?—Clearly; but a mode of examining might be contrived which would save all that, and enable me to take a very great part of the duty, which I would do with pleasure.

Have you stated to the Senatus Academicus, or to the Medical Faculty, that you consider the present mode of examination one in which no Physician engaged in practice can be expected to take a share?—Yes, I have, in a printed letter, in which I proposed a mode of examining, and pointed out the advantages which I have described here.

Do you mean the mode of examining which is followed at Cambridge?—Yes, and Trinity College, Dublin.

Have you requested an exemption from this duty from the Senatus Academicus?—No. I have never considered that they had any title to ask it.

Is that founded upon your idea of the authority of the Senatus, or of the nature of the duty imposed upon you by your commission?—From the nature of my commission.

Did you understand that Dr. Gregory attended all the private examinations?—He attended all the examinations, as far as I recollect.

Will you have the goodness to transmit to the Commissioners a copy of your Commission?—Yes, I will.

Did you not state, that you submitted to the Senatus Academicus your reasons for not being able to attend as an examiner?—No; I submitted my proposal for altering these examinations, according to a plan which appeared to me both useful to the candidates and convenient for the examiners.

Did you not in that printed paper also state, that the present course of examinations is such as prevented you, on account of your practice, from attending?—No, I did not specify that; I might have alluded to it, but not specifically.

What did the Senatus Academicus do, in consequence of the proposal contained in that paper?—They took no notice of it whatever.

Do you know if any opinion was ever formed or delivered by them, in the Senatus, on the subject?—No, I have no occasion to know.

Although you could not attend the whole period of the examinations, for three hours a-day, might it not be very practicable, by attending for a few minutes, or for a short time, to examine each of the candidates upon the particular subject with which you are more peculiarly conversant?—It might.

Would it not be a desirable object?—It would be scarcely useful, according to the present mode of examining.

Are you aware if the Medical Faculty have a permission, according to their discretion, having once ascertained the candidate's knowledge in Latin, to examine in English?—No; that was proposed, but I never knew how it was carried on; I attended two or three meetings, but every meeting altered what had been done before.

If you are informed that such, in point of fact, is the case, do you think that by *vivâ voce* examination in English, you could not easily ascertain a candidate's knowledge in that branch, on which you wish to examine him?—Quite well; but I should suppose that, in passing a candidate for a Medical degree, every examinator should be permitted to examine upon other points than those in his own particular department; it would not answer any purpose, supposing I found a candidate ignorant of every question I put to him, for my single voice and objection might have no effect.

But would not other Professors see that that gentleman was ignorant of your particular branch, and would it have no effect upon them?—It might have.

After the *Statuta Solennia* come to take effect, which it is understood they will upon those who are to graduate after 1830, and after which those who present themselves for graduation, must have attended your class; is it your purpose then, in some way or other, to take a part in that examination?—It will depend altogether upon the mode of examination; I never did grudge any trouble in my Academical duties.

Though the examination may not be in as perfect a form as you would desire, do you consider that a sufficient ground upon which (supposing an arrangement might be made by which you could attend for a short period of time) a Professor ought to exempt himself from taking any part in that examination?—I shall certainly, with great pleasure, in any way make myself useful. I can pledge myself for nothing more, at such a distant period as three or four years hence.

Do you consider that any person is entitled, on his own opinion, to object or refuse to act under the *Statuta Solennia* enacted by the Senatus Academicus?—Certainly not hitherto; but, where there is a *novus homo*, it is a different case, and where he has nothing for his trouble.

Do you suppose that the Senatus Academicus has no authority to make any new regulation at all, that shall be binding on all Professors?—I doubt that, without the concurrence of the Patrons.

357

University of Edinburgh.

Professor Hamilton, junior.

2 November 1826.

Conceding that in this the authority for requiring the duty originates with the Patrons, upon what ground does Dr. Hamilton think that he is not called upon to take some part in that duty?—Upon the same ground as other Professors in my department in other Universities, where they are not paid, and do not perform their duty as Examinators.

Have you, in point of fact, any doubt that the invitation to you to attend examinations, amounted to an admission that you were considered as a member of the Faculty of Medicine by that Faculty?—It is impossible for me to answer that question accurately, for there has been so much controversy on the subject, that I do not know what they intend.

Do you know if they have ever invited a person, not of their Faculty, to attend examination for graduation?—No; but then if they have had private meetings without summoning me, there would be a presumption that my presence was not wished or expected.

But the invitation being positive and repeated, can there be a doubt that they consider you as a member of their Faculty?—They have not given the proof that has been generally given. When the late Dr. Monro sent a letter to the Lord Provost, requesting to be appointed Professor of Medicine, (which was immediately granted, and was duly recorded in the Minutes of the Senatus,) his next appearance was as Dean of the Medical Faculty. And there are many other evidences to prove that there never was an appointment to the Professorship of Medicine where the Professor was not made *de plano* Dean. If it had been offered to me when the Commission of the 2d August 1824 was recorded by the Senatus, I was ready to take it, and do all the duties with pleasure.

Did you present a paper to the Patrons, desiring to be admitted?—No; I presented a Petition and Memorial, praying to be made Professor of Medicine as well as of Midwifery, and the Memorial was transmitted by the Patrons to the Senatus; who, after several months' deliberation, reported upon it. My Petition was then again taken into consideration by the Patrons, together with the observations of both parties, and also with the opinion of numerous members of the medical profession, unconnected with the University. It was on that account that I printed 200 copies of my Memorial, that is, that the Patrons might have the benefit of the advice of the medical profession in general. And upon all these considerations they granted me the new Commission.

Did you not state that you expected none of the fees to be appropriated to you?—I stated that distinctly.

Might not that statement, that you expected none of the emoluments, have made it a matter of delicacy in the Faculty to impose upon you the onerous duty of Dean?—It might have been.

There being that motive for not imposing upon you the duties of Dean, and having still twice invited you to attend examinations, how is it to be understood that they do not consider you as one of the Faculty of Medicine?—They took an hour when I was teaching my class, when it was impossible for me to attend the examination; and they did that twice.

Had you previously intimated your intention not to take a part in examination?—Never before the first notice. The first notice I got was to attend at three o'clock in the month of March 1825; and I stated that, before I could give an answer, I begged leave to get a reply to certain questions. I got that very civilly and politely from Dr. Alison. I then wrote to say, that, under the circumstances, I must beg leave, for that season, to decline the privilege of examining candidates. That was on the 19th of March 1825.

Was that the first summons you received?—That was the first summons. They had fixed the hour at three o'clock; I was lecturing in the College daily at that hour. Then the second year, again, they sent me a notice on the 4th of April, stating the same hour; and I do admit I wrote rather a severe answer in consequence: that was on the 4th of April 1826.

But was there not a regular invitation to attend, and might you not have gone, if you had chosen to omit attending your class that day?—Certainly.

When were those examinations to begin?—On the 5th of April, at three o'clock, at Dr. Monro's; on Thursday at Dr. Duncan's; on Friday at Dr. Graham's; on Monday at Dr. Hope's; and on Tuesday at Dr. Home's, at the same hour; and so on, at the houses of the Professors named, on the same days of the week as above.

How long does your class last after the 4th of April?—To the end of April.

Do the examinations last ten weeks?—Sometimes longer.

Then must there not have been many weeks during which you might have attended?—Yes.

And when you might have had it in your power to attend, in consequence of that invitation?—Yes.

Have you not declined doing duty in the Medical Faculty, until the dispute between the University and the Town was settled?—I certainly declined to do so; but, in a note of March the 19th, I only declined for that season.

But, generally, are the Commissioners to understand that it is incorrect, that you declined doing duty in the Medical Faculty, until the disputes between the University and the Town were settled?—I do not recollect anything of that, for I have been asked to do no duty except to attend examinations.

At what period of the year did you receive your new commission and were admitted to the Senatus Academicus?—The 2d of August 1824 was the day I was admitted.

Are the Commissioners to understand, that, from August 1824 until March 1825, you had not, in any way whatever, expressed your intention not to do duty in the Medical Faculty, either in the way of examination or in any other respect, to any members of the Medical Faculty, or the Senatus?—I had no communication with them on the subject.

Are the Commissioners to understand that there was no expression on your part of an intention not to take the situation of Dean of the Faculty, before that period or after?—It never was talked of.

University of Edinburgh.

Professor Hamilton, junior.

2 November 1826.

Are the Commissioners to understand that the only reason you have assigned for not performing your duty, or for not acting on the privilege of being an examiner, is because it interferes with your hour of lecture?—I had more reasons than that.

What are those other reasons?—Until the dispute between the Senatus and the Patrons, in which I was concerned, should be settled, I did not choose to change my status in the University.

Did you assign these reasons formally to the Senatus, or to the Faculty of Medicine, or to either of them?—In my note to the Dean of the Medical Faculty, Dr. Alison, of the date of March the 19th 1825, that was not implied.

What are the words of that answer?—I have not the answer here; I did not think of it.

Was that the first expression, on your part, that you declined?—Yes, that I declined for the present.

Then it was of no consequence, in 1826, what hour they fixed upon, as you previously had declined acting?—Surely.

Did not that answer, in March 1825, though you stated you declined examination for that season, imply, sufficiently distinctly, that you did not intend, during the continuance of that dispute, to do duty in the Medical Faculty, and did not wish to change your status?—The note did not express that; I simply declined for the present year.

You have stated, in answer to a question very recently proposed to you, that in an answer which you sent to Dr. Alison, the Dean of Faculty, it is clearly implied that you would not either perform the duties, or exercise the privileges, of being an Examiner for Medical degrees, while the dispute between the Town-council and the Senatus continued in existence, because you did not choose to change your status; will you have the goodness to state in what note that was mentioned, or at what time that note was addressed?—I have not stated that to the Medical Faculty at all; I am stating it here; they have no note of mine to that effect that I recollect at all. Upon recollection, I beg to state to the Commissioners that my objection was not stated in a note, though it might have been generally understood by the Faculty.

With reference to your own particular Chair, the Commissioners wish to receive from you any observations or remarks that you would be desirous of offering in the way of improvement?—It is impossible to answer that question. I can say that since 1800, when I was first appointed, I have been incessant in endeavouring to improve the lectures. I never gave two courses exactly the same, though I give three courses in the year. It is my constant wish to keep up the improved knowledge of Medicine generally, as well as my own particular department. Accordingly I have kept an amanuensis, to see that everything which comes out new shall be registered under its proper head.

Have you any observations you wish to offer as to the constitution of your Chair?—The Patrons have put the Chair on the best footing it can be, when it is fairly established. I need not complain of a want of salary, for everybody is in the same situation; there is no salary attached to the Chair.

Have you a Lying-in-Hospital to which you have access?—Yes; that is supported by a subscription; and as to the Museum, which has cost me £1,200, it is my own private property, and I never made the smallest application to the Patrons respecting it. I have now got into new buildings; formerly, I even furnished the presses for my preparations.

How many courses do you give in the year?—Until I got the new commission, I gave three courses; it was requested that I should extend the course to six months instead of three; and I can only give one course, which is a great patrimonial loss; but it is a great improvement, as it enables the incumbent Professor to extend very usefully his lectures upon the Diseases of Women and Children.

Do you give lectures to Female Practitioners?—Privately.

You have no class of that description?—I have a class, but it is one of question and answer, and the University do not recognise it.

What time does your course begin?—Generally the first lawful day after the sacrament, in November. When I gave three courses, I found it a matter of great annoyance to have ten days' holidays at Christmas; it is very inconvenient for the poor students, they lose so many days, they cannot go home; many of them are strangers here, and are obliged to meet twice a-day towards the end of the session, to make up for those ten days lost; it is an awkward thing; it is only of late it has been done, and it is only in the medical classes the evil is felt. The literary classes formerly gave ten days; that was natural, but I think the medical classes should go on steadily to the end of the course; for, considering the situation of the students, we can spare ten days at the end of the course better than in the middle. I think, that, if it were established no students should attend Midwifery that mean to graduate, until they have acquired a knowledge of all the other branches of medicine, it would be a great improvement.

Then you would make your class the last?—Yes; and accordingly, for several years, I was accustomed to read a quotation from the work of a celebrated teacher in London, Dr. Osborne, in which he recommended that all medical men, who mean to practise Midwifery, should attend from the beginning of their studies. I read the quotation to reprobate it, and stated, that I never chose to see any man at my class, who had not attended all the other classes; but I read that till I was tired, and it was never attended to; I see a great injury from it.

Do you consider that the part of your discourse, which relates to the Diseases of Women and Children, is analogous in that respect (with regard to the period at which it should be attended) to the Chair of the Theory and Practice of Medicine, as one of the higher classes?—Yes.

Does your observation apply to that part of your course which is more properly Midwifery?—Why, I can tell in a moment whether any student has got a knowledge of Anatomy, upon

University of Edinburgh.

Professor Hamilton, junior.

2 November 1826.

looking around me when I am giving an anatomical description of those parts that concern them. I can tell in a moment, when I am describing that there are so many arteries, the spermatics, and so forth: the young men who have not learned Anatomy do not understand a word—it does not convey an idea to them; consequently, without a previous knowledge of Anatomy, it cannot be understood by the students.

Would you wish to see an order prescribed, so far as these classes are concerned?—Certainly, upon graduates, who are the only ones we have a control over in this University; they should make Midwifery the last class they attend.

Would that be during the fourth year?—During the third or fourth. A great deal of the department of Diseases of Women and Children is lost, in consequence of the students not having a previous knowledge; they cannot follow the description of the phenomena of disease, nor understand the investigation of the causes. There is always a great defalcation when I begin upon these subjects; only the superior students who have been in practice continue to attend.

Do you mean the others do not attend from finding it not intelligible to them?—They have not a sufficient previous knowledge to make the subject intelligible.

Have you any other suggestion to offer?—I have to communicate that I have published a cheap text-book for the class, by way of a memorandum-book for the young men to recall to their memories what I have illustrated. I have directed the bookseller to sell it for 7*s*.

Can you account for the diminution of numbers in your class of late years?—In the first place, I give no summer course, and there is a prodigious number who can attend at at other time than summer. I could not give a six months' summer course, for all run away on the 1st of August. Then another cause of diminution is, that a number of men here teach for nothing; and young men that are idle, are very glad to attend for nothing, and charge their guardians and relations with it.

Are there lecturers who exact no fees in your branch of the profession?—Yes, they advertise, that the great respect they have for the Army and Navy, induces them to admit all gentlemen connected with them to their class gratis; and any other person that is recommended, they accept of.

In the list of students for the year 1815, the number mentioned is 314, and in a memorial of yours to the Senatus Academicus the number is mentioned as being above 400; how do you account for that?—I can account for it in the way I did to the Secretary of the University. I have, in a letter to him, said, that I directed my amanuensis to make out a complete list of the names of the students, for a very obvious discrepancy must at once be discovered between the number of students who have annually attended, and the yearly list of students recorded in the Album of the University. It was my duty to give three courses annually. I regularly sent in a list of students who attended each course, to give credit to each pupil in his certificate from the University for the extent of his attendance; and therefore the pupils of all the three courses within the year were counted, not as individuals, but were reckoned three times over. "Now, the 31st Query of the Royal Visitors requires a return of the number of students at each class during the last 50 years. I beg to inform them, that the inclosed contains, so far as relates to the Midwifery Class, the name of every student who has been placed upon the actual list, which is at your or their service." I may mention that the average number of the second course is stated in the printed paper alluded to—pupils attending in the spring is 41; if that number is taken for three courses there would be 123, and that explains the discrepancy at once.

What was your rule, with regard to fees, for those who attended the second and third course?—The established rule was, for the first course three guineas, for the second course two guineas, and for the third one guinea, and then they attend gratis. When, in 1812, the fees were raised, the charge was then four, three, and two guineas; but I have always made it a rule to charge only the old fees to pupils who attended the Midwifery Class, whether under the former or the present Professor, previous to 1812; so that it has repeatedly happened, within these two or three years, that men have attended the whole winter for a guinea.

Were those persons who had attended you before?—Yes.

Is there any general understanding in the University upon the subject of attendance for a second and third time?—It is quite arbitrary. I understand I took what was the established rule of my predecessor.

Edinburgh, Tuesday, 7th November 1826.

The EARL of ROSEBERY in the Chair.

Dr. Robert Christison, Regius Professor of Medical Jurisprudence and Police in this University, called in and further examined.

Professor Christison.

7 November 1826.

The Commissioners having finished your examination upon the general subject of the University, and heard your opinion upon all the points connected with it, are desirous of examining you upon the Memorial you have given in, and also with respect to your own particular class; will you have the goodness, therefore, to state any observations that occur to you, first, as to your own class, previous to taking into consideration the subject-matter referred to in the Memorial?—I do not remember I have anything, which I myself consider very material, to add to the representation I have given in; and anything I should say in evidence would be confined to such illustrations or explanations as the Commissioners might think requisite to receive on that Memorial.

Has Dr. Christison anything to offer to the Commissioners, with respect to improvement in his own particular class, keeping out of view, for the present, his ideas with respect to making it imperative, previous to the graduation of Medical students?—I have nothing to suggest

University of Edinburgh.

Professor Christison.

7 November 1826.

with regard to improvements, which might require the aid of the Commissioners to make. I am fully convinced, however, that if the class were attended, even but a little better than it is now, it would be proper to make some improvements; but these are improvements which would originate with myself, and which might afterwards be reckoned by my successor proper or not to be continued, just as in any other chair. The improvements I allude to, would be class-examinations, with the opportunity of practical instruction in such departments as require it, particularly in the department relative to the detection of poisons.

Those are improvements which you would wish to see introduced?—These I should like to see introduced, and I would certainly introduce them, if the students attended the class in even tolerable numbers. There is another improvement, which is one of very great importance indeed, both in regard to my own class and in regard to Medicine generally; teaching the students how to examine dead bodies for the detection of disease, injuries, poisons, &c. This is a matter which has been almost entirely neglected by the Professors of the Faculty branches of Medicine, and it is a department which cannot be well taught without practical instruction; at the same time, the Commissioners must be aware, from what I have already stated on the subject of dead bodies, that this could not be done without very great expense.

Then are you apprehensive, that, unless your class should be made imperative, a sufficient number of students would not of themselves attend it, so as to justify the introduction of this improvement to which you have alluded?—I should be apprehensive of it, but I by no means despair. I do not consider that in my own hands the class has yet had a fair trial.

Is that one, among other reasons, mentioned in the Memorial which you have given in to the Commissioners, why you think it necessary to make it imperative?—That is an additional reason.

Are there any other improvements that could be made in the class itself which you think would be beneficial?—I do not think there is any other.

Have you anything to state to the Commissioners, beyond what is contained in the Memorial, for the purpose of representing the propriety of making it an imperative class?—There is nothing I remember which I consider very material. I am sensible, however, that in making this representation I may have passed by many points which the Commissioners might think it of importance for me to have discussed more fully, but which I omitted, to make it as short as possible. There is one point I thought of introducing, and it is this: By several of those who are hostile to the study of Medical Jurisprudence by students, it has been objected to the argument, taken from the importance attached to it in foreign countries, that really, in the practice of law, it is of much less importance here than it is abroad, and than I have urged in my Memorial. I have to say, in reply to that objection, that, perhaps, in regard to the influence that the opinions of Medical men have in courts of law, it is correct; but as to the frequency of medico-legal examinations, and the necessity of medical men examining them profoundly, the objection does not apply; because, from all I can learn of the practice abroad and in this country, the examination of medico-legal questions must be as frequent here, and ought to be as minute as they are abroad.

Would you wish to make any observations upon any part of this Memorial, from your recollection of it, with a view of explaining more distinctly to the Commissioners what you may be fearful has not been sufficiently stated?—There are just two illustrations I think it might be of importance to mention, in reference to a note at the bottom of one of the pages, regarding the want of the knowledge of Medical Jurisprudence, even in the strict Surgical departments, by Surgical Practitioners of eminence. I allude to two cases that came under my knowledge recently, which illustrate this statement, I think, very distinctly; and, if the Commissioners think it would not occupy too much time, I would mention them shortly.

Have you a syllabus of your lectures?—I have brought with me a copy of a printed syllabus of my course.—[*Dr. Christison requested permission to give in a copy of a syllabus of his lectures, which was accordingly laid upon the table of the Commissioners.*]

Have you occasionally gone to different parts of the country, both to give evidence and make examination into cases of suspicion?—I have been employed in the neighbourhood of this town particularly, and in examining questions of poisoning more especially.

Upon other occasions, have the contents of the stomach been sent you from a considerable distance?—Of late particularly—sometimes by the Crown, sometimes by the country practitioners themselves.

Have you, from these opportunities of observation as to the opinions entertained in regard to questions connected with your own particular department, and from the investigations in which you have been engaged, observed considerable ignorance upon such points in country practitioners, otherwise intelligent and respectable in their profession?—If I was not afraid of being suspected of exaggeration, I would almost say universally, or nearly so.

Is it generally admitted, among men of eminence in your profession, that persons may obtain very great skill, and have great practice, without being particularly conversant with those questions that belong to Medical Jurisprudence?—I think it is very generally conceded, at least by those who have studied Medical Jurisprudence. I must beg here to refer the Commission to a very remarkable illustration in point to the case, namely, of the Gardner Peerage. There can scarcely be found a better instance of the effect of bringing together a great number of men, highly eminent as practitioners, but ignorant of Medical Jurisprudence, and whose evidence, therefore, amounted literally to nothing, and, I believe, was accordingly disregarded. Speaking as a Medical Jurist, I should say that the witnesses could never have fallen into the error of pronouncing so decidedly on the question at issue, had they studied the principles of Medical evidence.

Is it not understood that, in different countries on the Continent, there is much more interference on the part of the police than exists in this country, in every case, in regard to the

examination of persons after death, and after interment, by scientific persons, in cases where suspicion has arisen?—A great deal more than in Scotland, and even more than in England.

May not that circumstance increase the necessity of all practitioners in the country, particularly in Scotland, being conversant with Medical Jurisprudence, and with the effects produced by poison, and the means of ascertaining them, seeing that there is less interference on the part of the police?—I do not well know what reply to give to that question.

As there is less interference on the part of the police here than in France, is it not necessary that practitioners in this country should be better acquainted with that subject than in France, where attendance upon classes of Medical Jurisprudence is made imperative?—Upon the whole, I should think so.

Are you in the habit, in your class, of examining the evidence which has been given in remarkable trials?—Very regularly, as will be seen by the syllabus which I have just given in.

Has the prosecution of the study, connected with the class of Medical Jurisprudence, of late years, since the institution of the class here, led to the discovery of a more successful application of the methods of detecting poisons?—Unquestionably it has. The attention of various men throughout Britain has been turned to it; and the consequence has been that, in several departments of Medical Jurisprudence, our information is more accurate, and our power of detecting poison much greater.

Have you practised the test of reduction in the case of poisons?—Of late I have been a good deal employed by the Crown in these matters; and within the last twelve months I have been concerned in four cases where I detected arsenic, by the process of reduction, in very minute quantities—in two instances, to the twentieth part of a grain; and there is a case which, if it come to trial, will involve the question of the possibility of so detecting even less.

How long after interment has poison been found in the bodies of individuals?—The longest period, in any instance I have yet seen recorded, is fourteen months; it was a case that occurred in Germany.

What species of poison was it that was discovered?—Arsenic. This particular case belongs to a very remarkable set of examples that have lately occurred in Germany, where the bodies of the individuals were preserved entire by a natural process. It is now an opinion very generally, I believe almost universally, maintained among the Medical Jurists of Germany, that arsenic possesses this property; at all events, three sets of cases have occurred during the last twenty years where the bodies of two people, of three people, and of five people, were preserved, who had been poisoned with arsenic. In one of these, the arsenic was detected after fourteen months.

Has the result of recent investigations tended to throw some doubt on the universal existence of several of those morbid appearances which were previously thought to be infallible tests of the presence of poison?—Yes, certainly.

Have cases occurred where there have been no morbid appearances after death, but in which poison, nevertheless, has been detected?—Yes; one case occurred lately to myself.

Was that formerly believed to be impossible?—Yes, it was; and, of course, such a case would have been lost, for the detection could not have taken place, as, from the healthy appearance of the stomach, arsenic would not have been suspected.

Was that a case of mineral or vegetable poison?—It was a case of poisoning with arsenic.

In the examination of those cases that have been tried, in which there was a charge of poisoning, have you had occasion frequently to observe great ignorance on the part of the practitioners, and unsafe and unsatisfactory evidence?—Certainly.

Are you aware of a recent case at Exeter, where a person was acquitted upon evidence, which is now admitted to be an undoubted mistake, given by a practitioner brought from London?—I am fully aware of the case.

Is it not now universally understood, that that evidence was quite erroneous?—The evidence was erroneous; but, at the same time, the evidence of the Crown witnesses was very incomplete. The appearances had been said to be produced by onions. In regard to the case of Captain Donnellan, since it has been referred to by one of the Commissioners, I may be allowed to mention a circumstance which I have not seen in any work treating of that case, that the want of chemical evidence arose, in a great measure, from the inspectors not following the rules laid down in books of Medical Jurisprudence, and the forms for examining bodies. I need not mention those forms; but, in consequence of the method they adopted, the matter contained in the intestines flowed into the stomach in large quantity, and got mixed with the matter contained in the stomach; which, if Sir Theodosius Boughton was poisoned in the way alleged, must have contained the poison. In consequence of this accident, and on account of the rude method of analysis practised in those days, it was impossible to detect the poison.

Was it eight or ten days after the body was interred that it was examined?—I think it was.

In what University abroad is attendance on Medical Jurisprudence rendered imperative?—I do not, at present, know any exception; at least, so far as regards France, Germany, and Italy. There may be, but I am not aware of any.

Has the result of the increased attention paid, of late years, to that subject, been the publication of a great many Medical works of high repute?—Certainly.

Do you know if, in the American States, there are several classes made imperative for graduation?—I rather think not, but I am not well acquainted with the form of attendance for degrees in the American States.

Generally, with respect to other instances of violent death, such as drowning, child-murder, &c., is it now generally understood that there has been a great and important change and progress in regard to the weight and effect due to certain matters of evidence in such cases?—There has been a very great change in the opinion of Medical Jurists as to evidence in those cases; and, in particular, I should add, a conviction that Medical witnesses formerly went too

University of Edinburgh.

Professor Christison.

7 November 1826.

far, and spoke with too great confidence in their deductions from the Medical evidence. From this circumstance have arisen the absurd appearances that many Medical men have made in cases of drowning and child-murder; and those who have not studied Medical Jurisprudence, still continue to commit themselves, by drawing inferences from Medical facts much beyond what they are entitled to do.

Are there any poisons which you have no means of detecting in the stomach after death?—There certainly are; it is possible to administer even the common poisons so that the most practised Toxicologist could not detect them; at the same time, it would require very great knowledge of the mode of action of these poisons; at one time, it was supposed there were no tests for detecting vegetable poison.

Is there any further progress now making for the means of discovering vegetable and animal poisons?—I can give very satisfactory information on that head; for, at one time, it was believed that chemical analysis was of no use for the detection of any vegetable poisons; but now, in consequence of the late researches of the French chemists, we possess chemical tests, and those of no small delicacy: I speak in regard to two poisons, that have been well examined, opium and nux vomica; these are very common poisons, and now we possess chemical tests which are very characteristic, and also sufficiently delicate.

SUPPLEMENTARY OF DR. CHRISTISON'S EVIDENCE.

"To the Right Honourable the Commissioners appointed by His Majesty for the Visitation of the Scottish Universities.

"My Lords and Gentlemen,—The general understanding that His Majesty's Commission will inquire into the system of Medical Education now pursued at Edinburgh, and correct it, if necessary, together with the strong opinion, which, as will appear in the sequel, has been lately expressed by the Senatus of this University in favour of the Chair I have the honour to hold, will, I hope, be a sufficient apology for the detailed statement of its claims, which I humbly beg leave to submit to the review of the Right Honourable Commission.

"The Professorship of Medical Jurisprudence and Police, the object of which is fully explained in the adjoining printed Memorial, and in my Syllabus already transmitted by the Senatus, was instituted by the Crown in 1803, and has been successively held by Dr. Duncan, junior, Dr. Alison, and myself. In 1816, in consequence of an application by Dr. Hamilton, Professor of Midwifery, requiring the Senatus to attach his Professorship to the Medical Faculty, a similar application was made on behalf of the Chair of Medical Jurisprudence by Dr. Duncan, junior. But as the Senatus was at that time averse to change, and the existing members of the Medical Faculty decidedly opposed to any innovation, which should introduce other Professors to a share in their privileges, the representations of the claimants were thrown aside, without the Senatus having given a decision upon them.

"Matters remained in this state till about the year 1822, when the constitution of the Medical Faculty having been much altered (in consequence of the demise of several of the older Professors, and the appointment of younger men more conversant with the state of Medical Education elsewhere), a general feeling arose, both in the Faculty and in the Senatus, that a reform was necessary; and the expediency of an immediate inquiry was soon after decided by an application of Dr. Hamilton to the Town-council in 1824, praying them as Patrons to compel the Senatus to add his class to the Curriculum for graduates.

"I need not detail to His Majesty's Commissioners the several matters, which in consequence came at that time under the review of the Senatus, as they will be brought fully under their notice by the Senatus itself. The chief points of inquiry were—the propriety of extending the course of study to four years, the expediency of a preliminary education in Literature and Philosophy, and the question which of the following subjects of professional study should be added to the Curriculum, *viz.*, Midwifery, Medical Jurisprudence and Police, Practical Anatomy, Clinical Surgery, Natural History, and additional hospital attendance. The *ultimate* decision of the Senatus added a year to the course of study, adopted Midwifery and additional hospital attendance imperatively, required the student to attend any two of five other classes, *viz.*, the remaining four mentioned together with Military Surgery, and threw out preliminary education altogether.

"But I must here explain shortly to the Right Honourable Commissioners in what way the Senatus arrived at this decision, because it is very important to learn its precise and unincumbered opinion on the merits of the Chair whose claims I advocate, and because it will then be easy to show that its real merits were not and never can be judged of by the manner of decision which was adopted.

"At one time great fears were entertained by many Professors, and particularly by the members of the Medical Faculty, that the Senatus might go too far in the work of reform, and, by adding too great a number of new branches of medical study, as well as a preliminary course of Literature and Philosophy, would change the nature of the Edinburgh degree altogether, and turn the Medical Students away from the University, to seek knowledge and honours elsewhere. It was, therefore, agreed on,—though I should remark the Minutes of the Senatus are silent on the subject,—*that, besides deciding upon each point individually, the Senatus should reserve a right of voting on the whole conjunctly;* for it was thought that various circumstances might lead the Senatus to come to such a decision on individual measures as might render it advisable, in the opinion of a majority, rather to adhere, after all, to the old rules. Leaving out of view the novelty of this method of conducting the affairs of a deliberative body, it will not require any detail on my part to prove that it was detrimental to the developement of the real wishes of the Senatus, and to the impartial consideration of the claims of certain Chairs; since, however well founded their claims might be, they were thus ultimately intermingled and involved in the same fate with others, whose adoption was considered much more doubtful, or even positively inexpedient. And, in order to show at once the result which was to be looked for from the exercise of this right of revision, I have only to add that, from the beginning, throughout the whole course of the inquiry, several Professors individually declared their determination to vote against any improvement at all, if the particular change that each desired to carry through should be thrown out.

"On proceeding to the vote, it appeared, in the first instance, that the Senatus were unanimously agreed as to the propriety of adding a fourth year of study,—attendance on Midwifery and additional Hospital attendance; the propriety of a preliminary course of Literature and Philosophy in a Uni-

3/63

Professor Christison.

7 November 1826.

versity was thrown out by a large majority; as was also attendance on Clinical Surgery and Practical Anatomy,—the latter, because the Professor himself declared it impossible for the graduates to qualify themselves on account of the scarcity of dead bodies. The additions hitherto mentioned as having been adopted, the Medical Faculty, in a previous Report, had recommended unanimously, or by a large majority. On the propriety of adding Medical Jurisprudence to the *Curriculum*, the Faculty did not report; but its members were known to be equally divided in opinion on the subject. To any other addition they were unanimously hostile. At the vote of the Senatus, the claims of Medical Jurisprudence were sustained *by a majority of eleven to four*, and those of Natural History by a majority of eight to seven.

"At this time, therefore, it appeared that a very large majority of the Senatus were of opinion that graduates should study four years, and should attend, in addition to the former *Curriculum*, Midwifery, Medical Jurisprudence, and a little more Hospital Practice;—that the Medical Faculty were favourable to all of these changes, except the introduction of Medical Jurisprudence, about which they were equally divided; and that, in opposition to the unanimous opinion of the Faculty, the Senatus agreed, by a narrow majority, to add also Natural History.

"Other minor matters having been subsequently disposed of, the Senatus, at a very full meeting, a month afterwards, came to a vote, as had been agreed on, as to the propriety of adopting the amended code, which was accordingly passed by a small majority. But the motion on the subject was put in such a shape as to involve, not only the general question previously agreed on, but likewise, contrary to the general understanding, *a second deliberation* and vote on the individual articles. In fact, after a second motion to introduce Clinical Surgery was negatived, the decision of the Senatus in favour of my Chair and that of Natural History, was annulled by a previous motion being carried,—that they should be included along with three others in a regulation, requiring graduates to attend at their option any two of the five. The three other classes were Clinical Surgery, Practical Anatomy, and Military Surgery.

"In short, a subject which a very large majority of the Senatus had previously voted imperative for graduation,—another which it had likewise decided, though by the narrowest majority, to be imperative,—two others, which a large majority had considered it inexpedient to adopt,—and one, Military Surgery to wit, which never was proposed as a necessary class—were all put, by this final vote, upon the same ostensible footing. Nay, as matters actually stand, the subject among them whose claims had been considered the strongest, namely, Medical Jurisprudence, will be very little benefited by the measure; since, of the other four, two are required, and therefore attended, at any rate, by all of those numerous graduates who also take the Diploma of the College of Surgeons. These are Clinical Surgery and Practical Anatomy.

"The foregoing narrative will, I trust, convince His Majesty's Commissioners how little reason I have to be satisfied, on the part of the Chair I hold, with the result of the late inquiries of the Senatus, on the reform of Medical Education, and will, I hope, induce them to listen, in the exercise of their powers of inquiry, to the following statement of the claims of my class—a statement which, on account of the diversified discussions that have been held in the Senatus, on the merits of Medical Jurisprudence, and the general want of information inseparable from the newness of the Science, I regret it has been quite impossible for me to lay before them in more moderate compass.

"In stating the claims of the Professorship of Medical Jurisprudence to be put on a level with the other Medical Professorships, I beg, in the first place, to submit to the Right Honourable Commissioners the following *Letter*, which was addressed, in October 1824, to the Principal and Professors, at the time the subject was brought under the review of the Senatus, and which contains an exposition of the objects and importance of the Chair of Medical Jurisprudence, of the little knowledge at present possessed of the Science by Practitioners, and of the causes which have hitherto weighed down the class and prevented it advancement:—

"*To the Principal and Professors of the University of Edinburgh.*

"Gentlemen,—The Medical Faculty, in presenting to the Senatus the result of their late deliberations, regarding the changes which the progress of science has rendered advisable in the Medical studies of graduates in the University, have judged it expedient to notice those changes only which they have agreed to recommend. Other points, however, are understood to have been also brought under their view, and among these, the propriety of requiring attendance on a course of Lectures on Medical Jurisprudence and Police. Although no mention is made of it in the projected amendments, I am induced to lay the following statement before you, as the ultimate judges; because, independently of my private interest in the matter, I account it my duty to the chair I hold, not to let slip so favourable an opportunity of claiming for it that attention, which, I am assured, the medical world now generally desire it should receive, but which has been hitherto wholly withheld from it by those who regulate medical education. It is likewise no small encouragement for me to state its claims on the present occasion, that from what I have long known of the private opinion of the members of the Medical Faculty, three of the six are favourable to its being adopted, in some way or other, as a part of the Curriculum, and that I have been repeatedly advised to address the Senatus on the subject, by several other Professors, in whose judgment it is accustomed to place considerable reliance.

"If the Chair of Medical Jurisprudence and Police were similarly circumstanced with those which have at different times been added to the Curriculum, I should be satisfied with stating its claims personally to the Senatus, when the reformed code shall be discussed. But the Senatus, in making former additions, seem to have acted on the principle of adopting only those classes which have been virtually adopted by the students themselves; and the Chair of Medical Jurisprudence and Police has never been so situated, as to render its adoption conformable with that principle. This fact, indeed, has been often held out as an insuperable objection to the necessity of making it a distinct branch of study. In order to remove these unfavourable impressions, it will be requisite to explain to you the nature and object of the science, and the extraneous causes which have retarded its progress in this country; and in doing this, I shall have to mention several facts, whose authenticity I am bound to give you ample leisure for ascertaining. I have little doubt, therefore, that the course I now pursue will be approved of.

"The two branches, comprehended under the title of the Professorship, are known in the foreign countries in which they were first cultivated, by the general name of Legal Medicine. It has been most appropriately defined, the science by which medical knowledge is applied to the composition, interpretation, and administering of the laws. The object of *Medical Jurisprudence* is, to prepare the Physician and Surgeon for determining all questions in law, which are determined by medical evidence. Such questions occur in criminal law, upon most trials for homicide, whether by wounds, by strangling, or by poisoning, and on all trials for rape, criminal abortion, exposure of infants, concealment of pregnancy, and infanticide. In civil law, they occur in cases of disputed pregnancy, in some suits for divorce, nullity of marriage, and reduction of testaments; and in all questions of disqualifications, whether of body or of mind, such as for serving in the army, or on juries, or as witnesses—for making insurances on lives, for exercising various public functions, or for

University of Edinburgh.

Professor Christison.

7 November 1826.

managing one's private affairs. The object of Medical Police, on the other hand, is the preservation of public health. The following are the subjects which it is generally understood to embrace:—The salubrity of situations for houses, villages, cities, and the means of improving their healthiness,—the selection of proper articles for food or drink, and the means of preventing and detecting their adulteration,—the influence of education and profession on the health, and the means of preventing their injurious effects,—the mode of excluding and destroying contagious disorders,—the regulations for the practice of Medicine, Surgery, and Pharmacy,—the erection and management of public edifices for the preservation of soldiers and seamen, for the confinement of prisoners and lunatics, for the support of the poor and infirm, for the reception of orphans, foundlings, and pregnant women—for the preservation and relief of accidents, for the cure of the diseased and the wounded.

"In order to give you a clear idea of the utility and importance of the science, as thus described, it will be sufficient for me to state, in brief terms, what place it holds in the system of education pursued abroad; what consequence is attached to it in trials at law, and various political inquiries; and *lastly*, what share it occupies of the Medical Literature of the day.

"1*st*, Legal Medicine is a science of modern creation. Most authors agree in ascribing its origin to the enactment, by the Emperor Charles V., of the celebrated Acta Carolina, the first European code by which the aid of the Physician was formally required in the administration of justice. Since that time, the press of Germany, Italy, and France, has teemed with publications on the subject. Professorships of Medical Jurisprudence and Police were first established in the German Universities, about the middle of the 17th century. In France, the first lectures on it were delivered by a surgeon of repute, M. Louis, about the middle of last century; and in 1792, when its code was revised, Professors were appointed in all the Medical Schools of the kingdom. In these two countries, it has since continued a regular and indispensable branch of medical education for Physicians and Surgeons. In France particularly, where its present state is best known to me, it is held in very great estimation. Several of the most distinguished Parisian Professors have owed their celebrity, chiefly or entirely, to their lectures and publications on Medical Jurisprudence and Police; and when I attended the course of the last Professor, M. Orfila, in 1821, he was followed by no fewer than 800 or 900 pupils. I am not so well acquainted with its progress in the Italian schools. Several interesting works, however, have been lately published on the subject, in that country; and it appears, from the preface to the *Medicina Forense* of Professor Tortosa, published in 1809, that not long before that period, or about the time when the Italian states were formed into a kingdom by Napoleon, Professorships of Legal Medicine were instituted in all its Medical Schools, and the study of it made imperative on all students. Such, in fine, is the importance it possesses in these three kingdoms, that, not content with a single Professorship, the subject is separated into its two great divisions in all of their schools, and each is taught by a distinct Professor.

"2*d*, The consequence attached to it by our Courts of Law, and other Courts of Inquiry, will be at once apparent to the members of the Senatus, if their attention be turned for a moment to some of the most remarkable criminal trials that have taken place in Britain, and to a few of the Medico-Political inquiries which have occupied, from time to time, the consideration of the House of Commons.

"Thus, taking for example, only one department of Law: A criminal trial, for injuries against the person, can hardly occur, in which the medical evidence is not essential to the establishment of the *corpus delicti*; and, in a great proportion of cases, it constitutes almost the entire proof. In support of this statement, I beg to refer those who desire distinct satisfaction of its truth, to the following well-known trials:—(1.) That of Chancellor Cowper, in 1699, for the murder of Sarah Stout. (2.) That of Philip Standsfield, in 1688, for the murder of his father, Sir James. (3.) That of Miss Blandy, in 1752, for poisoning her father. (4.) That of the supposed murderers of Sir Edmund Bury Godfrey, in the time of the Popish plot. (5.) That of Mrs. Ogilvy, and her brother-in-law, for poisoning her husband, in 1765. (6.) That of Miss Butterfield, in 1775, for poisoning James Scawer, Esq. (7.) That of Captain Donnellan, for poisoning his brother-in-law, Sir Theodosius Boughton, in 1781. (8.) That of Charles Angus, in 1808, for poisoning his housekeeper, Miss Burns. (9.) That of Eliza Fenning, in 1815, for attempting to poison her mistress and whole family. (10.) That of Mr. Donnall, a surgeon, for poisoning his mother-in-law, in 1817; and (11.) That of Mr. Hodson, a surgeon, at Sunderland, who was tried last August for attempting to poison his wife.—In all these cases the medical evidence formed the most prominent features of the trial, and determined the nature of the verdict; and no one can read a few of them, without being satisfied that our lawyers, although they sometimes take the liberty of undervaluing and sneering at medical evidence in principle, have always attached very great importance to it in practice. This observation might be supported by hundreds of cases of a similar description in the other departments of criminal law, and likewise by a variety of civil actions. But unfortunately, the records of them are too imperfect.

"In proof of the warm interest which the House of Commons has uniformly and justly taken in the other great department of legal medicine, it will be sufficient for me to remind you of their late laborious investigations and voluminous reports on the subject of the Vaccination question, the Walcheren Fever, the Contagion of Plague, the Ophthalmic Institution, the Epidemic Fever of Ireland, and the Millbank Penitentiary. On perusing these reports, you cannot fail to be satisfied of the importance possessed by such inquiries in the eyes of the nation.

"3*d*, Having supplied you with the means of judging how far the science has forced itself, I may say, on the attention of our Courts of Law, and on that of the country at large, I shall now refer to what I cannot help considering the very best and most impartial source of information regarding the light in which it is viewed by the thinking part of the medical profession in Britain, namely, to the proportion it forms of the medical literature of the day. It is only within these few years that the British press has produced works of any consequence on the general subject of Medical Jurisprudence. A few pamphlets, consisting of little else than mere outlines, were published soon after the opening of the present century. But the first regular book which appeared was the Elements of Forensic Medicine of Dr. Gordon Smith, printed in one volume, octavo, in 1819. Since then no less than four systematic works have been published in the English language: an octavo volume, by Dr. Male; an elaborate work, in three volumes, octavo, by Dr. Paris and Mr. Fonblanque, an English barrister; a second and enlarged edition of Dr. Smith's Elements; and, lastly, a Treatise, in two volumes, octavo, by Dr. Beck, of the United States, a work of very great value, which is about to be reprinted in London. But a fairer and more comparative view of the extent of medico-legal literature may be had by consulting the Periodical Journals. In the Edinburgh Medical and Surgical Journal, which has long held the first place among such works, the papers strictly belonging to Medical Jurisprudence and Police, which have appeared during the last ten years, form between a fourth and a fifth part of the whole. Owing to the peculiar arrangement followed by the London journalists, the proportion in their works cannot be ascertained without great labour; but, from what I have been able to make out, it is about a seventh or eighth of the whole. Now, if even the latter proportion be compared with the respective shares held by the other Medical Sciences, it will be found that not one of them, except the Practice of Physic, equals it; and that many of them, but particularly Midwifery (which alone the Faculty propose to add to the Curriculum), are vastly beneath it.

"Notwithstanding the consequence thus evidently attached to it by our Courts of Law, by the public in general, and by the medical profession, it is a notorious fact, that a very great proportion of medical men are almost or wholly unacquainted with it. This statement may seem at first sight contradictory to that just

University of Edinburgh.

Professor Christison.

7 November 1826.

made, regarding the number of medico-legal publications. But it should be remembered that the writing part of the profession forms a very small proportion of it; and, besides, it is well known, that most of the original papers, which have appeared in our journals on medico-legal subjects, have been written on the occasion of particular trials; when the authors, probably for the first time, became aware of the importance of medico-legal inquiries, and were consequently led to examine the subject of their writings with a degree of attention and labour proportioned to their previous ignorance of it.

"But, be this as it may, there can be no difficulty in proving to your satisfaction, the extraordinary want of information in Legal Medicine which at present prevails throughout the bulk of the medical profession in Britain: you have only to examine the reports of any trial on which the medical evidence formed a conspicuous and influential part; or to appeal to the opinion entertained by our lawyers of the appearances made in Court by medical witnesses; or to ask medical gentlemen themselves how they regard medico-legal investigations, and what are their feelings when their attempts to escape the witness-box have failed.

"It would be of much consequence, and very easy for me, to illustrate the present statement, by referring to a number of errors actually committed on trials, and arising from ignorance; but as they can seldom be explained without considerable detail, I could not do so without protracting this Memorial to an undue length: yet as the subject cannot be thoroughly understood by the unprofessional, without some illustration, I hope I shall not appear needlessly prolix, if I relate one very remarkable set of examples; which will show, not only that such errors are very frequent, but likewise that they have a most important influence on the issue of trials, and that, while Medical Jurisprudence remains neglected, as it is now, they will continue to be propagated from century to century. There are often found on the dead body certain marks,—arising, in some instances, from the effects of putrefaction, and, in others, from changes that take place immediately after various kinds of natural death,—which bear a considerable, and often a very exact resemblance, to the contusions produced by blows during life; and it is of moment to remark, in passing, that the mode of distinguishing them is taught in no class, so far as I know, but in that of Medical Jurisprudence. These resembling appearances have been the fruitful source of error on Criminal Trials. The first instance I have found recorded, was on the famous trial for the murder of Sir Edmund Bury Godfrey, in the time of the Popish Plot. The dead body of Sir Edmund was found in a field near London, with his own sword run through his chest, and with black and blue marks, as of blows on the chest, and of strangling round the neck. A great deal of weight was attached to the two last appearances, and it was supposed that he had been first strangled, and then run through with his own sword after death, to make it appear that he had fallen by his own hand. Although this view of the case was taken by all the medical witnesses, it is quite plain, from their description, either that the marks in question were caused by putrefaction, or that the parts on which they were situated were in such a state of putrefaction, as rendered it impossible to discern their true nature, even by a much more careful examination than was actually instituted. The next case I have met with, occurred at the Aberdeen Circuit, in 1764, on the trial of Keir and his mother, for the murder of his father,—a case which excited extraordinary interest at the time, and for several years afterwards. The prisoners were condemned; and the jury seem to have been led away by popular clamours. The only evidence of any weight against them was the appearance of a broad blue mark round the fore part of the neck, which the witnesses compared to that produced by strangling. No one, however, who is well acquainted with medical jurisprudence, can doubt for a moment that the mark must have been merely a variety of *livor*, caused by natural processes soon after death. A very remarkable example of the same blunder happened in this city, in 1808. Three men left a public-house, drunk and quarrelling; and next morning one of them was found expiring in a wood, and actually died soon after he was discovered. Two surgeons deponed that they found the marks of numerous contusions all over the body; and, accordingly, the companions of the deceased were committed and afterwards tried for their life. But the late Messrs. John Bell and Fyfe, proved on the trial, that the apparent contusions could be nothing else than the livid marks which appear spontaneously on the dead body after many kinds of natural death. The last example I have met with occurred in London last January. The body of a young female was found in the Thames; and a suspicion arose, that six days before, she had been murdered and thrown into the water by a man with whom she cohabited. The man alleged, that in the dead of the night they went together into a boat, pushed out to the middle of the river, and then threw themselves into the water with the view of perishing together; that he had scarcely done so before he repented and endeavoured to save himself and his companion; but that the stream carried her away. This most suspicious story proved in the end to be really true. But three surgeons who examined the body declared that they found on it various contusions, especially about the head, face, and neck,—a circumstance which was naturally considered quite hostile to the man's declaration; and he was accordingly committed for trial. Most fortunately, the inspection had been made without the coroner's warrant; and he, offended at the disregard shown to his authority, ordered the body to be re-examined by another surgeon. The new inspector applied to the alleged contusions the criterions laid down in works on Medical Jurisprudence, and satisfied the Court on the trial, that they were nothing else than the effects of death by drowning, combined with incipient putrefaction.

"I have to repeat, that, in descending to particulars, and stating these pointed cases, I trust I shall not appear needlessly prolix; and I shall only add (and my predecessors in office will assure you I am correct), that it would be easy to overwhelm you with examples of the same description,—with examples which would concur with those given above, in showing that the blunders daily committed are not mere casual and unimportant slips, but grave and systematic errors, arising from an almost total want of medico-legal knowledge among practitioners.

"No one, I presume, will hesitate to ascribe the defects now mentioned to an imperfection in the present system of medical education, or to believe that they will continue as long as medical men, during the period of their studies, are allowed to disregard Legal Medicine, as if it were a useless branch of knowledge; for every one knows how impossible it is for a man, whose professional habits are once formed, to devote his time and attention to a new science, of which he has to study the very elements: if I have been successful, therefore, in demonstrating that it is really an important and useful branch of knowledge, it follows that some means should be devised for diffusing it.

"I need not dwell on the impossibility of accomplishing this by the present course of study, or by the improvements projected by the Faculty of Medicine. No one can allege that Legal Medicine is taught, directly or indirectly, in the course at present enjoined on the graduates of our University. That it is not, will be evident from the account I have given of the little information possessed on the subject by the profession,—from the high rank it holds in the medical schools abroad,—and from the fact, that Dr. Duncan, senior, was long ago led to give separate lectures on it in this University, and afterwards to prevail on Government to institute the present Professorship. It is quite unnecessary for me, then, to enter into a detail of the topics which are taught by the Professor of Medical Jurisprudence, and by him exclusively. Granting that the Chair was properly instituted, it only remains for you to determine whether it appears to you of such importance as to entitle it to a share of that patronage or protection, which almost every other Chair in the University enjoys, or whether it should be still left to struggle unsuccessfully with the peculiar difficulties which have hitherto surrounded it.

"These difficulties are great and obvious. In the *first* place, while the subject of the Chair is confessedly the most difficult to teach of all the Medical Sciences—for it requires a most extensive and minute acquaintance with almost all the others, and is attended only by the most advanced students—it has been hitherto taught by the youngest and least experienced of the Professors. I need not stop to show how injurious this circumstance must prove in the case of a science which has to strive against the paralyzing influence of many years of neglect.

"In the *second* place, as the duties of the Professorship are not much less than those of the rest, and the

University of Edinburgh.

Professor Christison.

7 November 1826.

emoluments vastly inferior, it is obvious that, while the prospect of improving it under the present system is so unpromising, no one will be easily induced to devote himself exclusively to it, and bestow on it that attention which the difficulty and extent of the science would require. Accordingly, it has twice happened, that just as the Professor, partly by a long course of labour in his own department, and partly by his celebrity in other branches of Medicine, was beginning to draw the attention of students, and to lay the foundation of a well-attended class, all the fruits of his labour have been lost by his translation to another office. The Chair has, in consequence, been again and again thrown into the hands of a young man, unknown to the students and the medical public, and thus again and again condemned to pass through the same career of tedious and almost imperceptible advancement. I beg to call the particular attention of the Senatus to this fact. It lays open a difficulty which will weigh down the class of Medical Jurisprudence and Police for ever; for, to those acquainted with the subject, it must be perfectly well known, that *if the Professor is qualified to teach it and render it popular*, he is also qualified to teach various other more lucrative departments.

"But *thirdly*, and worst of all, it has had to strive against the neglect, I might almost say the publicly-expressed neglect, of those who regulate Medical education, and to compete for popularity with other Chairs, filled by men of long experience and distinguished talent, and protected by the Regulations of the Faculty, or College of Surgeons, or both together. The Chair of Legal Medicine has now existed for more than one-and-twenty years; and during that long period, while the course of study for graduates has been annually advertised and several times changed, while the course for Surgeons has likewise been regularly advertised and often altered, so that at last every other Medical Chair has become more or less a protected one, that of Legal Medicine alone has never been so much as recommended, either by the Faculty or by the College of Surgeons, or its name even simply mentioned as a branch of medical knowledge. What was to be looked for as the inevitable consequence of such disregard? Would not the students inevitably infer, that what their masters, whom they had left, did not know, and their Professors, who directed their education by public statutes, did not even mention, must be a needless branch of study? When they saw new classes and new modes of study enforced year after year, sometimes by one body and sometimes by another, and still no notice taken of Medical Jurisprudence, was not their inference doubly inevitable? Nay, farther, one of my predecessors repeatedly applied to have the Chair included in the course of study, and still no notice whatever was taken of it in the instructions issued to the students. As this was perfectly well known, they could not but conceive that the application was unreasonable, and consequently that there was no call on them to attend the class.

"The Medical Faculty will allow me to suggest, that they are probably not aware how much their Regulations influence the students in their medical pursuits. These Regulations, it is presumed, are intended by their framers, only to enforce such studies as are absolutely indispensable for Graduation—not to point out what course of study is desirable to form a thorough Physician. From a very recent, extensive, and intimate acquaintance with the students, especially of the better class, I have some reason to assure you with confidence, that your rules are too often viewed by them in the latter light; that, besides following what you prescribe, they are too apt to stick to the strict letter of your statute, by not following what you do not prescribe; that this error frequently arises from ignorance of the propriety of collateral studies;* and that, to secure the thorough collateral and fundamental knowledge, which some members of the Senatus wish to enforce by statute, much might be effected by a simple recommendation, issuing from the Faculty, and stating what branches, besides the compulsory ones, they consider it advisable for a well-educated physician to attend. I have known many intelligent graduates lament their ignorance of the sciences connected collaterally with Medicine, and express their conviction that a procedure, on the part of the Faculty, such as I have mentioned, would have prevented their deficiency, and would be welcomed by the students at large.

"Of the effect on the students, produced by the silence which the Faculty and Senatus have hitherto maintained, with respect to the chair of Legal Medicine, I cannot give you a better example than what happened in my own case. Bred, I may say, within the walls of the University, and at all times in close proximity with several of the Medical Professors, it may easily be supposed that my education was much more complete than that of Medical Students in general, yet I was a graduate before I knew almost what Medical Jurisprudence meant. I believe my immediate predecessor was in nearly similar circumstances; and I know that, of my companions, who were chiefly of the best educated class of students, not one attended Dr. Duncan, junior, at that time Professor.

"I apprehend, therefore, that the Senatus, in expressing their opinion on the subject of the present memorial, will find themselves reduced to one of two alternatives. Either they must account the class of Medical Jurisprudence a needless one, in defiance of the sentiments long entertained by the whole Continental Schools of Medicine, and in defiance of all the other strong considerations formerly stated; and in that case it will not be easy for them to explain why, with so many opportunities of ejecting it, they have allowed it to occupy so long a corner in the University; or, being useful and necessary, they must provide means for attracting to it the attention of the students, and raising it to the station it should occupy.

"To what length the Faculty shall be advised to go in providing these means, I, of course, cannot be allowed to judge. I may be permitted to state, however, that there appear to me but three courses which can be adopted: either the Senatus will advise the Faculty to issue a mere recommendation, which, judging from the present circumstances and past history of the class, I may venture to infer, would now effect little or nothing; or it will advise the Faculty to issue a stronger recommendation, grounded on an announcement of their intention to examine as minutely and regularly on Legal Medicine as on the other Medical Sciences, but allowing the students to pick up their knowledge where they please; or, finally, they will add the Professorship to the Faculty, and enforce the class as a part of the Curriculum.

"Before concluding, I should observe, that in illustrating the nature of the subject professed by the Chair I hold, and stating its claims on your protection, I have confined myself to the relation it bears to criminal law, and to one of its departments chiefly. This comprehends but a part, however, of the single division of Medical Jurisprudence. Its relations to civil law are also extensive, and would be much more so, if our courts of law were once satisfied that medical men understood the scientific questions which are often involved in civil suits. But, in particular, I would call your attention to the unbounded and interesting field of Medical Police; a subject which I have barely touched on in the foregoing observations. No department of Medicine is more important to the country, or better calculated to show the value of the Medical Sciences, and yet none is more neglected by almost all ranks of the profession. At the same time, no country affords more ample opportunities than our's of cultivating Medical Police; but it would be a Herculean task to undertake, and such as no qualified person will undertake without more inducements than exist at present.

"Nor is the study of Legal Medicine calculated to produce only these intrinsic advantages. It would be attended with others of considerable importance in relation to the other branches of Medicine, which at present compose the Curriculum.

"In the *first* place, it would relieve several of the Chairs from their present superfluity of matter. While it possesses many topics peculiar to itself, it contains others also, by which it is connected with all the other Medical Sciences. These common topics are necessarily treated by the other Professors very cursorily. It cannot be expected that the Professor of the Practice of Physic shall enter fully into the vast subject of contagion, of marsh miasma—of insanity—in their medico-legal relations; that the Professor of Chemistry, or of Materia Medica shall detail, with exact minuteness, the tests for the poisons, and the symptoms produced by them; that the Professor of Midwifery shall exhaust the numerous Medico-legal topics connected with his branch; or the Professor of Physiology and Pathology those minute physiological and pathological inquiries which have frequently to be discussed in Courts of Law. Each of the Professors of these branches

* Of course I need not mention that Legal Medicine cannot be viewed as merely a collateral study.

7 November 1826.

knows that his science is quite overloaded with matter. One of them has assured me, that the introduction of a course of Medical Jurisprudence into the Curriculum would, on that account, be a great relief to him; and I hope no one among them will now be found so attached to old notions, and averse to all improvements, as to call that relief an encroachment.

"*Secondly*, The study of Legal Medicine is well calculated to perpetuate, in the student's mind, a taste for the fundamental Sciences of Medicine, and to teach him how its various departments may be brought to bear upon and aid each other. It has long been matter of regret, that, so far as regards the fundamental sciences of Anatomy, Chemistry, Physiology, and Materia Medica, the attention of the student to them is almost confined to the period during which he attends each class. One science drives out the last, just as he passes from one class-room to another, and at length he becomes a student of dry practice merely, and, in the end, a mere trading practitioner,—with the advantage, indeed, of having his ideas generalized, and his mode of thinking influenced by the variety of pursuits he has been engaged in, but quite unable to turn them to any useful account. The only class which is fitted to teach him how to combine the fundamental sciences together, and to show him, before he forgets them, how advantageously they may be made to bear on one point, and support each other, is that of Legal Medicine. The whole range of the science is crowded with combinations of this kind. I shall quote one only by way of illustration, because it is familiar and easily understood. No man can investigate a case of poisoning, unless he be well versed in the physiological effects of poisons, in the symptoms peculiar to them and to natural disease, in the morbid appearances produced by the same causes, in the external characters of the poisons, and in their chemical properties. Thus, he must bring his knowledge of Physiology, Symptomatology, Materia Medica, Pathology, and Chemistry, all to bear on one point; and his knowledge in all of them must be accurate and minute. On many occasions the power of thus combining the Medical Sciences together would be of great service to him in the ordinary practice of his profession: but few possess it; for they have not been taught it when young, and the sciences required have gradually slipped from their memory for want of an early appreciation of their practical utility. This want, I conceive, the study of Legal Medicine is admirably fitted to supply.

"I have not laid the foregoing representations before the Faculty of Medicine at the time they were occupied with the new *Statuta*, because I knew that the subject was to be considered by them, and was assured that any interference on my part was unnecessary, as the Faculty possessed ample sources of information in my two predecessors, Dr. Duncan, jun., and Dr. Alison. I had intended, however, to subject this letter to the opinion of the Faculty, before the meeting of the Senatus; but it has been called sooner than I anticipated.

"I have the honour to be, Gentlemen,

"Your most obedient servant,

"R. Christison."

"When I addressed the preceding representation to the Senatus, I had not the remotest idea that any one would allege, as an objection to the express study of Medical Jurisprudence, that it does not form a distinct branch of Medicine, or that it was taught by the Professors of the Faculty. Conceiving that no one would hesitate to believe *that* a distinct branch of study, which has been long considered such by every Continental school without exception, I omitted the proof of this for brevity's sake. It turned out, however, that I was wrong. Advantage was taken of the omission; and out of it was framed the only objection of moment which was started against my argument. Of the few who opposed my claims, on the occasion when they stood singly for the opinion of the Senatus, some insisted that the Chair of Medical Jurisprudence taught nothing which was not taught by the other Professors. Others appeared to hold virtually the same opinion, by endeavouring to prove, that the chief topics taught by the Professor of Medical Jurisprudence are appropriated by him through a species of encroachment on the property of his colleagues.

"In order not to leave now any blank in my argument, I beg leave to fill up that left in my Memorial to the Senatus. In doing so, I shall take an opportunity of meeting the objections which, on consulting the opinions of others, His Majesty's Commissioners may find are entertained by persons not adequately acquainted with the subject.

"Here I may set out with the well-known, and *hitherto undenied* fact, that our students, when they have completed their education, are almost or altogether unacquainted with Medical Jurisprudence. I can honestly declare, for my own part, that when I graduated in 1819 (on which occasion, I may be permitted to add, since it is to the point, I received from my examiners something more than the customary terms of approval) my acquaintance with Medical Jurisprudence amounted to little more than a knowledge of its name. The same was the case with my associates, who were among the flower of the graduates of that year. And I have ample opportunities of knowing that all are similarly circumstanced, except the few who have made Medico-legal science a distinct object of study. It surely cannot be thought for a moment, that this would be their state, if the science was actually taught by the present members of the Faculty.

"I must next recur to a statement in my *Letter* respecting the little knowledge in Medical Jurisprudence possessed by practitioners, as proving that, at a more distant period also, Medical education was, in the foregoing respect, not better circumstanced than it is now. I have given one entire set of examples to show that certain facts and doctrines, which have been familiar to *Medical Jurists* for two centuries, are not known to *practitioners* of the present day. I may refer, in the present place, to another argument of equal or superior weight; and I do so with peculiar pleasure, because among the Right Honourable Commissioners there are several distinguished individuals who can bear testimony to the truth of what I state, or correct me if I am guilty of any misrepresentation.

"I allude to the fact, that practitioners throughout Britain are very imperfectly acquainted with that most important part of their Medico-legal duties,—the method of conducting the Medico-legal Inspection of dead bodies. Excepting a few of those made in Edinburgh,* where, if the case is important, it is easy for the inspector to procure the aid of persons skilled in Medical Jurisprudence, I may venture to affirm—and I do not hesitate to rest my cause on the accuracy and importance of this statement alone—that hardly a single inspection is made which is not marked by essential errors or defects. This is apparent in the Reports of the Inspections delivered to the Sheriff—of which Reports a considerable number have now passed through my hands, and of which I have not seen one but contained flagrant errors and omissions, and showed that the framer had not made this branch of his profession an object of study. The evil now complained of is a far more serious one than it appears to be thought by our courts; because, not only are the Reporters themselves in consequence disqualified from forming a sound opinion, but likewise, the facts of the case having been inaccurately ascertained, other persons of skill can seldom do more than pick holes in the evidence of the original Reporters. I am sorry to add that this is the chief use which has been hitherto made, in actual practice, of the knowledge of the Professor of Medical Jurisprudence. As no pains are taken to have the Medico-legal inspections conducted according to the rules of art, it

* At the same time, I am prepared to mention instances of omissions and oversights committed in important cases, very recently, and in this city, by persons of the highest respectability as *practitioners*.

University of Edinburgh.

Professor Christison

7 November 1826.

follows that the chief use made of his knowledge is, to bring him forward as evidence for the prisoner, for the purpose of pointing out the defects and correcting the errors of the Reports and Crown evidence, and of proving that the Reporters are not borne out in their conclusions by the facts, and not well versed in the subject of investigation. As to the fact that inspections are very generally bungled, and the reports of them erroneous, I beg leave to refer in proof to the opinions of my two predecessors in office, Dr. Duncan, junior, and Dr. Alison, and likewise, if I may be allowed the liberty, to the legal experience of four distinguished Law Officers, members of the Right Honourable Commission.

"I must beg leave also to be allowed the liberty of referring to the experience of the Right Honourable Judges, of the Lord Advocate, and of the Solicitor-General, in regard to the value of Medical Evidence generally, as it appears on criminal trials. I need not say that Medical Evidence is held in very low estimation; and I am willing to admit that it deserves to be so held, at least as it is known at present. My object in noticing its low condition is to state, that if the witnesses understood Medical Jurisprudence, their evidence would not be treated with the contempt it so justly receives at present.

"The chief cause, I apprehend, of the disregard shown by lawyers to Medical Evidence, arises from the singular discrepancy of opinion among medical witnesses, on almost every trial in which their evidence is important to the case. One cause of this discrepancy may be, that the questions to be decided are really very difficult and dubious; and then a discrepancy of opinion is no more to be wondered at, than a difference of opinion among lawyers in analogous circumstances. But by far the most common cause is, that the case is insufficiently examined in the first instance; and consequently that the Court receives the decided opinions of ignorant men against the prisoner, and the dubious or contrary opinions given in his favour by persons better skilled in Medical Jurisprudence. Nay, very frequently, as, for example, has always happened hitherto in my own case, the uncertainty has been still farther increased by the Crown-witnesses being skilled in ordinary practice, though not in Legal Medicine, and the witnesses for the prisoner being young practitioners, but better acquainted with Medico-legal practice.

"I do not well know what course to follow in order to satisfy the Right Honourable Commissioners, that our Courts would not be harassed by this contrariety of opinions, if the witnesses who delivered them were conversant with the Medico-legal duties of their profession. If the Law Members of His Majesty's Commission entertain the same opinion of Medical Evidence, as I am aware is entertained by many lawyers, I cannot establish to their satisfaction the statement now made, without such details as I believe could hardly be allowed me. But I can most conscientiously declare that, if it shall please the Right Honourable Commission or its Law Members to institute an inquiry regarding it, there is no search, however curious and particular, which I should not most cheerfully submit to and court. And I know I speak the mind of every man in the profession who has studied Medical Jurisprudence, when I say that an inquiry of the kind would not fail to be signally beneficial in removing the obstructions to justice, which daily arise out of the Medico-legal inquiries in criminal cases.

"Meanwhile I may be allowed to state two facts, which I have no doubt will receive all the weight they deserve. The first is, that, convinced as I have long been, upon principle, of the certainty of Legal Medicine, I have never failed to be struck and delighted with the close agreement on questions of importance, or even of difficulty among all who have acquired the reputation of sound Medical Jurists. On several recent occasions, especially, I have had to consult with my two predecessors on questions of intricacy; and I positively do not exaggerate when I say, that there has hardly ever been a single point of difference among us. On several late occasions, too, I have had the curiosity to consult others, on whose judgment I can rely, as to opinions which I had delivered in court, and in like manner I have never, in any instance, found one who disagreed with me. The second fact is one to which I humbly beg particular attention. The German language contains many periodical works, edited by the Professors of Medical Jurisprudence, and sworn Medical Jurists of Germany, and consisting of collections of admirable cases, minutely detailed and fully authenticated. Of these works, which have been hitherto locked up from the British Physician, and which form complete courses of Medical Jurisprudence in the way of examples, I have at present in my possession about fifty volumes, published between 1780 and 1824. Among the immense number of questions contained in them, if we except those published expressly on account of the errors of the witnesses, and some others relative to subjects little known at the time, there are very few, and these only cases of great natural complexity, upon which the opinions delivered are not remarkably concordant throughout, and agreeable, if I may rely on my own judgment, with what a sound Medical Jurist would deliver in the present day, and in this country.

"Having stated these general facts, which I apprehend will make the Right Honourable Commissioners very unwilling to believe that Medical Jurisprudence is taught by the present members of the Faculty, I shall now bring this Representation to a close, by descending to particulars, and stating what are the actual subjects which they do not teach, and which I do.

"Of the first topic in the Syllabus, which I had the honour of transmitting through the Senatus,—that, namely, which treats *of the Signs and Causes of Natural Death* (two lectures),—the first section, *the several Causes of Natural Death*, I admit belongs equally to the Professor of the Practice of Physic,—with this reservation, however, that he does not take a general view of them, as I do. The two other sections, namely, *the Mode of determining whether the Signs of Natural Disease, found in any given case, are adequate to account for Death*, and *the Distinctions between the Real and the Imitative Appearances of Disease*, are not only not taught by any Professor of Medicine, as I know from personal experience, but likewise are not treated of in any printed work whatsoever with which I am acquainted.

"The second topic—*the Medical Jurisprudence of Wounds and Blows* (ninth section)—it may be said, belongs properly to the Professor of Surgery. To which I reply, that the Professor of Surgery, when I attended his course, hardly introduced a single sentence of the matter I teach;—that no other lecturer on Surgery, I ever heard of, does so;—that fully one-half of the disquisitions in my lectures are not to be found in print;—and that I am perfectly willing that the truth of what I now say be tried, by submitting my lectures to any lecturer on Surgery for his opinion, whether his course contains what mine does.

"The third topic treats *of Poisons*. The introductory part treats of the physiological action of poisons generally, and of the various branches of evidence of general poisoning (fifth section). Not only are these topics not treated of by any other Professor, but I am at a loss to conceive which of them could go so far out of his natural course as to teach them. The *Particular Poisons* are discussed in

3b9

University of Edinburgh.

Professor Christison.

7 November 1826.

about twenty lectures. It may be said that the Chemistry of them belongs to the Professor of that branch; the symptomatology and appearances in the dead body, to the Professor of the Practice of Physic; and their physiological action to the Professor of Materia Medica. Let us grant, that the student can of himself combine in practice knowledge gathered from so many quarters: I have, in the first place, to ask, which of the present Faculty Professors teaches the force of evidence of the several sources of proof, singly and combined, and illustrates this by reference to trials? Next, I beg to remark, that the whole observations of the present Professor of Chemistry, on *the Chemistry of Poisons*, might have been comprehended in two lectures at the utmost; while my remarks include about *ten*, which are quite few enough. Next, on *the symptoms and morbid appearances caused by Poisons*, I have the same remarks to make. When I attended the lectures of the late Dr. Gregory, on the Practice of Physic, scarcely a word was said on the subject; and indeed it is quite impossible for the Professor to give ten lectures (which are absolutely necessary in reference to the evidence of poisoning) without the glaring neglect of other matters more essential to his proper department—*practice*. As to *the Physiological Action of Poisons individually*, that is a small department, common to me and the Professor of Materia Medica; but I believe my observations are necessarily fuller.

"The fourth topic—*Death by Asphyxia, or by smothering, strangling, hanging, and drowning*—is a subject which positively was not, in the slightest degree, touched on by any Professor or other teacher, in the ample course of study which I underwent at this University before graduation; and, except the single small department of the Physiology of Asphyxia generally, I cannot conceive what Professor could, with propriety, take charge of it. This topic is discussed by me in six lectures.

"Of the next four, namely, *Death by Burning, Cold, Lightning, and Starvation*, (third section,) I have the same statement to make. A small part only of the lecture on death by burning is common to the Professor of Surgery.

"Then follows an Appendix on the art of conducting Medico-legal Inspections, on Medical Reports, and on Medical Evidence (4th section). On the two last of these subjects I need hardly say, no other Professor but the Professor of Medical Jurisprudence can lecture with propriety; on the first, *no other Professor in my day ever has lectured.*

"Next, *as to the Questions relative to the Function of Generation*, when I attended the present Professor of Midwifery, scarcely any notice was taken, except of the purely physiological part, which in my lectures (eight in number) does not compose a third of the whole. On the force of evidence in cases of sterility, impotence, rape, criminal abortion, exposure of infants, concealment of pregnancy, child-murder; on the mode of answering the correlative questions that occur in Courts of Law; on the mode of examining the bodies of infants—Dr. Hamilton *then* gave either no information at all, or a few scattered hints only. I say *then*, because since my claims were brought before the Senatus, and the importance of Medical Jurisprudence was shown by my *Letter*, and the consequent discussions, he announced in a paper, in which he tried to prove the inutility of Medical Jurisprudence, his intention of thenceforth teaching the obstetric part of it, in twelve lectures. I do not object to his doing so; for I conceive the Students would be gainers in this, as in other departments of Medicine, by hearing two views of the same subject, namely, by hearing the result of the practical experience of one, and from another the result of the immense experience of the Accoucheurs and Practical Medical Jurists of Germany and France. But I must protest against this encroachment being assumed by the Professor of Midwifery, as an argument against the distinctness and value of the subject of my rofessorship.

"Under the topic of *Disqualifications*, which I discuss at present in three, but which I propose extending through eight lectures, is included *Insanity*, which may be claimed by the Professor of the Practice of Physic. I have to observe, however, that if he confines himself, as he ought, to the symptoms, morbid appearances and treatment, he leaves untouched one-half of what I have to say on the subject. The other topics included under the present head, namely, disqualifications for marriage, military service, and effecting life assurances, cannot, I imagine, be treated of by any Faculty Professor, without his going completely out of his path.

"To sum up the whole, then, a vast proportion, nine-tenths at least of my course, is either not touched on at all, or is discussed in a totally different manner, and with totally different views, by the present Professors of the Medical Faculty. In truth, the identity between my lectures and theirs consists in the titles, not in the essence of the subjects, and therefore no more entitles any one to say that I teach only what they teach, than to say, that the Professors of Natural History, Materia Medica, and Chemistry, lecture on the same subjects, because they lecture on the same substances.

"The Right Honourable Commissioners will probably be a little surprised, when I add the following supplementary argument used by my few opponents in the Senatus, in stating the objection that has led to the preceding details. It has been alleged, that the present Faculty Professors *may* teach Medical Jurisprudence by each taking to himself any portion that can be construed as bearing a reference to the subject of his Professorship. Regarding this proposal, I shall say nothing farther than a word or two as to its practicability.

"That it is possible, in one sense, I admit. The Science may be partitioned; there is hardly a single subject of lecture in the present Faculty which might not be partitioned and taught in like manner. But whether it is possible, in another sense, the Right Honourable Commissioners will easily judge when I inform them, that by the common consent of every dispassionate man in the profession, the Professorships of the Practice of Physic, Surgery, Chemistry, and Materia Medica (among whom my subject would fall chiefly to be distributed), are already overloaded with matter far beyond the compass of the University course,—and that, in point of fact, the Professors of the Practice of Physic and of Materia Medica, for at least twenty years past, have never completed, in a Session, their course even as it now stands; while the Professor of Chemistry cannot complete his, without lecturing two hours daily for about three weeks, towards the close of the session. Surgery, for want of a separate Professorship, has never been fully taught in this University; but pure Surgery is now a vast field, not less extensive than pure Physic.

"In conclusion I have to add, that although I have said nothing of the topics peculiar to the other department of my Professorship, Medical Police, because I have not completed my lectures on it, it would nevertheless be easy for me to show, as in regard to Medical Jurisprudence, that many topics are really quite peculiar, and the greater number of the rest common to the Professors of the Faculty of Medicine only in name, and not in substance.

"I have the honour to be, my Lords and Gentlemen,

"Your most obedient and humble servant,

"*Edinburgh, October* 6, 1826. "R. CHRISTISON."

University of Edinburgh.

Professor Ballingall.

7 November 1826.

Dr. *George Ballingall*, Professor of Military Surgery in the University of Edinburgh, called in, and further examined.

Have you any remarks to offer beyond what you mentioned verbally when you were last before the Commission, or what are contained in the Memorial you have given in with respect to your own particular class?—Before proceeding to my own class, I wish to say, that I omitted to mention, when I was last here, a proposal of Dr. Duncan, senior, for the institution of an inferior degree of Medicine, of which I am disposed to think favourably.

You mean the degree of Bachelor?—It was a compound degree: "Medicinæ Baccalaureus et Chirurgiæ Magister" was the proposal.

Was that the description of the inferior degree of which you would approve?—Yes. The proposal has been more than once brought before the Senatus Academicus, by Dr. Duncan, senior, but has never been gone into.

Was it proposed that that degree should give a licence to practise?—It was proposed that it should give a licence to practise. The truth is, I think our present degree is too much of a licence to practise, and too little of a literary honour. This degree, which Dr. Duncan proposes, seems well calculated for what some of my colleagues call "a good working degree." My objection to the present degree is, that it has become too much of a working degree, and I think an inferior one should be instituted.

Would you propose, that the person who is to take that degree should have the same education as is now required for a Doctor of Medicine?—Perhaps not to the same extent, somewhat inferior; and the present degree of M.D. should be elevated in its character, particularly by the introduction of a preliminary course of education.

Would there be no risk that there would be too many persons practising upon the inferior degree?—I think it is a degree admirably adapted for the general run of practitioners; and I think it is just the degree they should practise upon. I would propose it should be somewhat akin to the qualifications required by the College of Surgeons, which, I think, are sufficient for the common class of practitioners, the *Routiniers*, as they are called abroad.

Are those qualifications equal to what are required by the regulations of the Senatus Academicus?—Not quite, but very nearly.

Is there any important difference between them?—There is this important difference. According to our present regulations, we impose a year longer for the course of study. On the other hand, the regulations of the College of Surgeons impose some classes which, I think, ought to be imposed on the graduates in the University; for instance, Practical Anatomy and Clinical Surgery. They are both optional, as it at present stands with us, and I think they ought to be made imperative on all graduates.

Do you think, that the rendering these additional classes imperative to a person graduating for that inferior degree, would be an equivalent, in point of Medical instruction, for the loss of one year in the Curriculum?—I think the regulations of the College of Surgeons, as they now stand, which are all capable of being embraced in a three years' course of study, are equivalent to the qualifications which I should propose for this inferior degree.

Will you inform the Commissioners, whether the qualifications imposed by the College of Surgeons (which render it necessary that a person should attend two classes, which he is not bound to attend in the University of Edinburgh, previous to becoming a Doctor of Medicine), would render a candidate as skilful in Medicine as a person taking the degree of Doctor of Medicine in the University, with one year more, but not attending those two classes?—I think hardly equivalent to the one year more in the University; for there is thus a longer period of attendance imposed upon the candidates for Medical degrees, and an additional course of Clinical Medicine.

Is there not an apprenticeship in the other case?—The apprenticeship is not imperative.

In which case is there not an apprenticeship?—It is not imperative in any case; but is very much encouraged by the members, as being a very advantageous way of employing their time in Edinburgh, where the apprentices can carry on their medical studies without loss of time.

Do you think that an individual receiving the inferior degree, which you are now proposing, would in every respect be sufficiently qualified, and possess sufficient medical knowledge to practise medicine in the country with safety to the patients?—The regulations for this inferior degree have never been fixed, and therefore it is impossible to say.

Supposing the regulations for this inferior degree were the same as those now established by the College of Surgeons, in your opinion would they fit a man receiving a lower degree (such as Bachelor of Medicine) to perform the functions of a medical man in the country with safety to the public?—Yes, with the addition of lectures on Clinical Medicine, which are not now made imperative.

Would that addition render the education nearly as complete as that of a Doctor of Medicine is in the University of Edinburgh?—Yes, I think it would, and even more so, with the addition of Clinical Medicine, which is not made imperative by the College of Surgeons.

Would you make the study of Clinical Medicine imperative, previous to the degree of Bachelor of Medicine being conferred?—Yes, and the mastership of Surgery; that was Dr. Duncan's proposal, which I think well of, and which I think is calculated to form what they call at present "a good working degree."

Would not this Medical education be more full and complete than what has hitherto been required in this University for the degree of Doctor of Medicine?—I think it would be fully as complete as the education under the old regulations.

Is it not more complete, and does it not include a greater number of classes?—I think it does; it includes Practical Anatomy and Clinical Surgery, which have never been imperative, and are not now imperative on the candidates for the Doctor's degree; I think it must

be better than any that has hitherto prevailed, from its including those two classes; and it includes Midwifery, which is now only begun to be imperative.

Does it not include attendance upon a public hospital for one year, and was that required under the old system?—It was required under the old system; a course of Clinical Lectures was required, which implied attendance upon an hospital.

What examination would you have the candidate for the new degree go through, previously to taking it?—An examination by those professors whose classes it was imperative on him to attend.

Do you conceive, that that examination would be as complete a test of his attainments, as the present examination for the degree of Doctor of Medicine?—Yes; I think so.

Would it be pretty nearly the same?—Yes; the only examinators would be, those whose classes it was imperative on the candidate to attend.

With respect to the medical education which had been acquired, would it go as far as the present examination?—I think it would.

Do the College of Surgeons require two courses of Anatomy?—They do. There is one remark I may make, that by the medical regulations for the Army, it seems that our graduates are not qualified to be hospital mates—at least, not necessarily so, without attending other classes, besides those which are required by the Medical Curriculum of this University, and particularly, more Anatomy.

Do you know whether the Senatus Academicus has not been restrained, by a desire not to appear too anxious to promote their own monopoly, and therefore did not require attendance so often upon some of the classes, as they might otherwise have done?—Perhaps they were: I do not know.

That consideration does not apply to such a body as the College of Surgeons, does it, as they take private lectures, given by all recognised lecturers?—Yes, they do.

Would you recommend, that the University of Edinburgh should take certificates of attendance upon private lecturers?—There may be special cases, in which those certificates might be admissible; but I think they should not generally.

When you say there may be special cases, do you mean with reference to the eminence of the individuals giving the lectures?—More with regard to the particular branches of study—such as Practical Anatomy, for instance, that may not always be commanded within the walls of the University. I can conceive it possible, that there may not be sufficient means for studying it here. There are other cases specified in my introductory observations, where these gentlemen who were not possessed of the degree of A.M. should submit to an examination before the Faculty of Arts. These gentlemen can only be supposed to have certificates from private teachers; and there may be several cases in which I think it would be right to take such certificates.

Will Dr. Ballingall now proceed to make any remarks he may be desirous of offering to the Commissioners, with respect to his own particular class?—In alluding to my own class, I wish to speak with all possible respect of my predecessor, who possesses talents and learning to which I have no pretensions; but, at the same time, I must be permitted to think that that class was not conducted during the war in such a way as to give it that status and consideration in the public opinion, to which I conceive it is entitled. Had Dr. Thomson been bred a Military Surgeon, and had he devoted the energies of his mind to that class alone, I think it would have held a different rank in the public estimation and in the University, from what it now does.

Was it taught before your time as a separate class?—I believe not. Dr. Thomson held two Professorships: he was Professor of Surgery to the College of Surgeons, and Professor of Military Surgery within the University; and when I attended him, he conducted the two courses together—the pupils feeing the one, being admitted gratuitously to the other.

Were Dr. Thomson's lectures delivered within the walls of the College as Professor?—On reference to Dr. Thomson, I find that his first two or more courses were delivered within the University, and that in consequence of the insufficient accommodation afforded him, he obtained permission of the Patrons to deliver his lectures subsequently in his own class-room, in Surgeons' Square.

Was there a room appropriated to the class at that time?—No room was appropriated until it came to be my class.

Might a room have been obtained if it had been applied for?—That I am not competent to answer. I had no difficulty in finding a room when I applied for it. With regard to the introduction of my class into the Curriculum, I have said I do not think it necessary to be introduced; and if my class is to expect any protection, it is from the Army and Navy Boards. That protection I have never yet applied for; but I have no doubt it will be granted, so far as can be done consistently. But while this is the only Professorship of Military Surgery in Great Britain, there is a difficulty in procuring it; for if the students are told they must study Military Surgery, it is tantamount to saying they must come to Edinburgh to learn it.

Upon the whole, do you think that the footing upon which your class stands now,—not making it positively imperative, but optional in students to take it, as one of the two which must be imperative,—the best arrangement that could be followed?—I hope the Commissioners will do me the favour to understand, that the partial protection which my class has got, is not an act of mine, but purely an act of the Senatus Academicus, and was not granted upon my solicitation.

Do you think that act was a beneficial one?—I think it must prove beneficial to the class.

But do you think it is beneficial to Medical Education?—I have always considered my class, as only applicable to candidates for a particular line of service, and as not necessary for a graduate in Medicine.

University of Edinburgh.

Professor Ballingall.

7 November 1826.

Have the regulations, to which you have alluded, yet taken effect?—They have not. My own feeling is, that leaving any class optional, is not an expedient measure. I think it ought to have been specified, what classes were imperative, and what not. I think, leaving any class optional, is tantamount to saying, it is not absolutely necessary.

But you think two of them ought to be made imperative, Practical Anatomy and Clinical Surgery?—Yes.

Have you anything, in addition, to offer to the Commissioners?—I wish to correct an error in the printed answer; my name is omitted in the list of the Senatus Academicus, in page 3 of these Answers, where it should be introduced, between the names of Mr. Bell and Mr. Napier. There is another point I do not observe notice taken of; I mean the reason assigned for not forming a Museum for the instruction of my own class. I stated, in a written answer, that the reason is, I have free access to a valuable collection in the College of Surgeons, illustrative of my department, and now I shall have also access to the Anatomical Museum in the University.

Had you not access, as Professor in the University, to the Anatomical Museum, until lately?—I had no right to take my students there, and no right to refer to it in my lectures, which I now shall have the opportunity of doing.

Were you entitled, individually, to make use of it?—Dr. Monro very civilly afforded me access to it, but that of course must have been limited; he has been civil enough to offer me preparations out of it, but that was entirely a matter of favour on his part,

Was the use of that Museum previously entirely confined to the students of Anatomy?—The general use of that Museum was confined to these students; it is now to be rendered accessible to all Medical students, and the Professors are to have the privilege of referring to it in their lectures.

Dr. *Robert Graham*, Professor of Medicine and Botany in the University of Edinburgh, called in and further examined.

Professor Graham.

The Commissioners, having understood you were desirous of offering some fresh evidence, in addition to what you gave upon a former occasion, request you will have the goodness now to proceed with such additional suggestions as you may be anxious to state.—There were two subjects upon which I was desirous of making a few further observations: this, if the Commissioners will allow me, I shall now do. At the close of my last examination I was mentioning the subject of the Botanical Garden, to which the paper that I formerly gave in, bears reference. I took the liberty of calling the attention of the Commissioners to that subject; for I thought the matter of importance to the public, in as far as it is connected with the education of a very large proportion of those individuals who practise medicine in this country or its dependencies. And first, in proof of this proportion among those who practise Medicine in the Army. In the paper above alluded to, and of which I have here the scroll, I quoted a letter from Sir James M'Gregor, the Director-General of the Army Medical Board; and I will read an extract from that letter, if I am permitted. Sir James M'Gregor states:—"About one-third of the Medical Officers of the Army, and certainly the best educated portion of them, receive their education at Edinburgh." I have not a doubt, that the same proportion might be found, of those educated at Edinburgh, among medical practitioners in the Navy and the Colonies, and even in private practice in Great Britain. I have no documentary evidence to show it, but I have no reason to doubt that the proportion is at least equal. At my last examination, I stated that Botany was considered as an essential branch of education for medical men; and in confirmation of that I stated, that it was demanded of candidates for degrees at every University where degrees in Medicine are only granted after a defined course of study, and was also demanded of those gentlemen who entered the Medical Department of the Army. In confirmation of this, I will read another extract from the same letter:—"In regard to the utility of Botany as a branch of medical education, I can give no stronger proof of my sense of it, than that in the printed regulations of qualifications required of every gentleman entering the Medical Department of the Army, it is made indispensable that every one shall have attended a course of Botany;"—(in fact, two courses of Botany—six months being required, which are equivalent to two courses)—"and in an examination, not only of those who enter the service, but of those who come from half to full pay, and of every one who obtains a step of promotion, Botany forms one of the subjects of examination." I conceive it, therefore, to be important to Edinburgh, as a Medical School, that the Garden should be supported; but in further corroboration of this, I will read one other extract from the same letter of Sir James M'Gregor. He adds—"I cannot bring myself to believe, when the case is fully stated to Government, when they know the lamentable state the Garden is falling into, and how indispensably necessary the maintenance of it is to Edinburgh as a Medical School, that they will refuse the aid you require." I presume to hope that the concerns of the Garden are strictly within the province of the Commission. The Botanic Garden has been connected with the Professorship of Botany in the University, as the means of teaching the Class, for, probably, 150 years, as appears by the terms of the commission of Dr. Alston, in 1716, and a reference made in it to two older commissions, of which copies have not been found. In 1763, the Union was confirmed by an agreement entered into between the Crown and the Patrons of the University, by which a new Garden was made by the former; and the Patrons, on their part, bound themselves to contribute £25 per annum to its support, in consequence of the influx of students it was expected to produce. The connexion is also maintained by the Crown always appointing the same person, by the same commission, Regius Professor in the University, and Keeper of the Garden. The Garden must be looked upon as the apparatus by which the Professor teaches, and has identically the same connexion with his Chair, that the Museum has with that of the Professor of Natural History. The only difference is, that

373

University of Edinburgh.

Professor Graham.

7 November 1826.

it is, because it must be, without the College walls. The Professor of Natural History holds from the Crown a commission precisely similar to that of the Professor of Botany. He is appointed Regius Professor of Natural History, and Keeper of the Museum. He also, like the Professor of Botany, holds a commission from the Town-council. He is not by the Council appointed Professor of Natural History, but they take a protest, that their acceptance of the Royal commission to that effect does not take away their right to appoint a Professor of Natural History in the University, when they think proper. His commission from the Council only constitutes him Keeper of the Museum; but he considers only a very small portion of it as under their authority; the remainder is the property of the Crown. An allowance is also made for the support of the Museum by the Crown, as for the Botanic Garden; and the analogy is unfortunately complete—the allowance for both is much too small. I consider an additional allowance for the Garden to be absolutely necessary. It was long the great depositary of objects of Botanical Science in this country, and, in fact, the only one in Scotland, until the Subscription Botanical Garden at Glasgow was established. In consequence of this circumstance, and its connexion with by far the most crowded Medical School in the empire, donations were sent to it from every quarter of the world, particularly from those who had been educated in Edinburgh, and also by others; till at length so many plants accumulated in it, that it became necessary to increase the Garden nearly to three times its former extent; but no additional allowance was granted, and in consequence I was forced to expend a large sum of money out of my own pocket. I beg to correct a misstatement which I made at my last examination. I stated, I had expended last year nearly £300 from my own pocket: but I spoke from recollection, and found, on looking to a paper afterwards, that I expended only £189. 1*s.* 2*d.* beyond the allowance. But although I had expended this large sum, I could take no steps whatever to prevent the decay of the establishment, and many things were omitted that were essential in promoting its usefulness: what I expended was merely for the current expense of the Garden. But besides this, smaller Gardens expend much more money. The Botanic Garden at Glasgow, I stated, when I was last examined, expended, in 1824, the date of the last printed account, a very large sum of money. Though then only of seven years' duration, though labouring constantly to reduce its expenditure, though little more than one half the extent of the Royal Garden at Edinburgh, and with a much smaller range of glass, and with a much more limited collection of plants, and though placed in a country where fuel is of small value, the Directors expended £661. 8*s.* 5½*d.* A small proportion of this arose from the peculiar circumstances of the establishment, but the remainder was for matters necessary for every Botanic Garden. I also stated the great expense of the Botanic Garden at Liverpool, which is little more than one-third of the extent of the Edinburgh Garden, and has a comparatively small range of hothouses. I stated also, that the allowance made by Government for the expenditure in the Botanic Garden of the Royal Dublin Society, in 1825, was £1,649. No doubt its extent is greater than the Garden at Edinburgh; but much of it being devoted to agricultural purposes, it requires very little support. The scantiness of the present fund, even for the support of the old Garden at Edinburgh, was in a great measure the cause of the expense in forming the new, from leading to the total destruction of the old: for regular repairs became impossible, although additional payments were made occasionally for the discharge of debt. This subject is particularly pressed upon the notice of the Royal Commissioners, and they are entreated to observe the commencement of the same result at the new Garden; for the smallness of the allowance, compared with the disbursements for indispensable and current expenses, will not allow even of the painting of the frames and houses, much of the wood of which is quite bare, and must in consequence suffer immediate and great injury. For these and other reasons I petitioned the Treasury, on the 15th of February, 1825, to add £600 to the annual allowance, and I received for answer, that the Lords Commissioners of his Majesty's Treasury were not disposed to entertain the application for an increased annual provision out of His Majesty's hereditary revenues, for the maintenance of the institution, unless some stronger grounds than any that had yet been before them, should be adduced, for making this establishment a charge upon the public, instead of its being supported, as similar institutions were in other parts of the kingdom, either wholly or for the greater part, by the payments or subscriptions of those who were interested in, or derived instruction from them. On the 9th December following, when my accounts were audited, I accordingly transmitted a memorial to the Treasury, through the Barons of Exchequer, pointing out the peculiar circumstances of the Royal Garden at Edinburgh, and again anxiously urging the prayer of the petition. To this memorial no answer has yet been returned. I therefore consider it my duty to explain to the Royal Commissioners, first, the peculiarities of the Botanical Garden at Edinburgh, distinguishing it from botanical institutions in other parts of the Kingdom; and, secondly, why I conceive it impossible to obtain money for its support, from those who are interested in, or derive instruction from it. The circumstances in which the Royal Botanic Garden of Edinburgh is placed are quite peculiar. It is the only establishment of the kind, excepting that of Kew, which is the property of the Crown, or in any degree under the control of Government. It is a very old institution, attached to the Palace of Holyroodhouse before the Union, and under the superintendence of a Professor, who holds directlyf rom the Crown a Commission, appointing him Keeper of the Garden, and who annually renders *on oath* an account of every item of expenditure. The Garden at Edinburgh is connected with the Capital, and with by far the greatest Medical School in Britain, but which has no funds, and cannot therefore contribute in any degree whatever to the support of the Botanic Garden attached to it. At other Universities, the Botanic Garden is either endowed by individuals, or the University itself is largely endowed; and there is not in every case a Medical School, when Botany can only be regarded as an accomplishment to an individual, not as a necessary part of a professional

University of Edinburgh.

Professor Graham.

7 November 1826.

education in which the public are concerned; and therefore a very limited establishment answers the purpose. The number of graduates at Edinburgh gives its institutions a preference, as the stamps upon the degrees yield a revenue to Government, which may be valued at £1,100 per annum, and amounted in 1825 to £1,400, and in 1826 to £1,180. It is most willingly acknowledged that Government, in its liberal views for the promotion of education, has expended large sums of money on the University of Edinburgh; and this circumstance has given rise to the assurance, that if the necessity of the fund now sought were established, the same liberal views would direct it to be granted. It is believed impossible to raise money for the support of the Garden by subscription. For a new establishment this might be done; but for an old one it could not; especially as there is another Public Garden (that of the Caledonian Horticultural Society) supported in Edinburgh by this means. Even if it were possible, in part, to support the Garden by subscription, it cannot be too strongly urged, that it would be most injurious to the School. It could scarcely be proposed, without granting privileges and some share of direction, to the subscribers; and the mischief arising from this cause is severely felt by the Professor at Glasgow, and greatly impedes the scientific usefulness of the Establishment. Nor could the fund be materially improved by increasing the tax upon the students, and certainly the school would be greatly injured by the attempt. The students now contribute, for the support of the Garden, at least as much as at any other school; first, by paying a considerable part of the gardener's wages, which must otherwise have been discharged out of the Government allowance; and secondly, by paying the Professor. Experience shows, that it is much better that the teacher should be paid by the pupils than by Government, as affording a stimulus to exertion; and it is from this practice that the University of Edinburgh has acquired its character. It is firmly believed, that the raising of the fee would nearly put an end to the study of Botany at Edinburgh, and therefore the gain to the fund from this source would be very inconsiderable. The injury to the school by the refusal of the additional allowance would be irreparable, because it must immediately occasion the destruction of one large collection of hardy plants—that for the illustration of the natural orders—and of much more than one-half of the stove plants, and the whole of the large specimens of these, which have been accumulated with great care during very many years, and could never again be replaced. I have already stated that large sums have been granted by Government to other establishments, though not connected with any University. It is believed that the Lords Commissioners of his Majesty's Treasury have hitherto objected to increase the allowance in support of the garden, chiefly because the expense attending its formation has been much greater than they were led by the original estimates to expect. It is quite certain that these estimates were extremely defective—less in the amount of sums specified in particular branches, than in the oversight of items of expense palpably unavoidable: as in the formation of the ground, drainage, &c., &c. Another cause of the difference between the actual and estimated expense too, was the death of the Professor of Botany, during whose incumbency the plans had been drawn up, and the estimates obtained. His great age, and extremely bad health, prevented his attending so minutely to the arrangements as he otherwise would have done—and his successor, being ignorant of the estimates, and of the conditions of the grant, considered himself called upon to suggest many improvements. When the proposal for forming a new Garden was first made, it was believed that the old could have been offered for sale. This was afterwards discovered to be a mistake: but the circumstance is mentioned as showing, that at first it was not supposed Government would be put to so great an expense as was afterwards found necessary. Could the old Garden have been sold, and the proceeds applied to the new, as was at first contemplated, and as has occurred in other cases, where the site of a garden has become unfit from the extension of a town, the extra expense would have been very inconsiderable. It is most sincerely regretted, that from these causes any irregularity should have inadvertently arisen in the manner of addressing the Treasury on the subject of the new Garden at Edinburgh; but it is submitted that the extent of the Garden is not greater than the collection required, or the interest of education demanded; —that it does not do more than keep pace with the support which Government have thought it right to extend to other branches of this University; that it bears a smaller proportion to the *present*, than the Garden formed sixty years ago did to the *then* state of Botany; and it is hoped, that the Royal Commission will think it right to make such a communication on the subject as will prevent that irregularity from being visited by so severe a punishment, as the destruction of a large part of the establishment, and the impairing the usefulness of the whole, which would be the inevitable consequence of the allowance being refused. Lastly, I humbly submit, that the present Garden bears a smaller proportion to the extent of the Medical School, than the old Garden did at its formation in 1763; and also, that the proportion of students at the University who attend the Botanic Garden is much greater. Both these statements are confirmed by the following extract from the University records. In 1763, the date of the formation of the late garden, the whole Medical pupils at the University were 223, the graduates in Medicine were 10, and the students of Botany were 39; and in 1825, the whole Medical pupils at the University were 939, the graduates in Medicine were 140, and the students of Botany were 248. Therefore, the number of Medical students is nearly four times, and the number attending Botany is more than six times what it was, at the formation of the old Garden. In conclusion, I may be permitted to point out the peculiar hardship of my situation. The new Garden was resolved upon before I was appointed to the Botanical Chair; and though I cannot but rejoice that a step creditable to the country, and important to the University and to the public, should have been resolved upon, yet it will not be thought wonderful that I should feel it is hard to be compelled to contribute so very largely to the support of an institution resolved upon before my incumbency. These are all the statements I wish to make in reference to the Botanic Garden. In conclusion, I can only add that I am extremely

375

University of Edinburgh.

Professor Graham.

7 November 1826.

anxious for the inspection of the Garden by the Royal Commissioners, and that they should establish any inquiry into the matter they think fit.

Is there any other point on which you are desirous of giving information to the Commissioners?—The next point upon which I expressed a wish to be heard again, was as to Clinical Lectures. I stated, at my last examination, the great difficulty in Clinical teaching, to be the crowd of students that attend the wards, and that the Clinical Professors were unanimously of opinion, that if the students could be divided into two portions, such division would greatly facilitate their acquisition of knowledge. The manner in which I would suggest this should be done, is, that there shall be four wards in the Infirmary, open for patients who shall be the subjects of lecture; that two Clinical Physicians shall constantly attend, two wards being placed under the care of each; that the lectures shall be delivered by each, on two days of the week during nine months, but not on the same days. The students will not be able to see the patients of both physicians, as their visits will be at the same hour; but instead of two Clinical lectures weekly, as at present, they will be able to attend four; thus hearing the practical observations of both Clinical Physicians, and increasing the amount of their information. I understand the Managers of the Infirmary are willing to agree to this arrangement.

Will that accomplish the object of dividing the students equally?—The division may be unequal, but it will divide them; and though one ward may be more crowded than another, yet the great object will be obtained, in having the pupils divided; and those who are more desirous of having information by seeing patients, will go into the wards that are least crowded.

Is there any other point to which Dr. Graham has turned his attention, and upon which he is desirous of making remarks?—There were one or two subjects casually introduced at the last examination, upon which very little was said. First, as to the higher Degree in Medicine. I am not sure if the subject was introduced at my last examination, or whether it was not generally alluded to, by asking me if I had not read and approved of a paper which was referred to by Dr. Alison. I approve very much of giving a higher degree than that which is now given in Medicine, to any student who comes forward in this University desirous of possessing high literary as well as medical honour. They should have it in their power to take this higher degree; and if there be a demand in the public for a more literary degree than we grant now, the change will be gradually introduced into the University—not violently and at once, by requiring great literary knowledge from the ordinary graduates in Medicine. I need not enter more fully into an argument upon this point, for it was stated by Dr. Alison in the paper which he read, all of which I have seen, and of the whole of which I approve. It has been proposed, as I understand, to form a division between the Chairs of Anatomy and Surgery. I can have no hesitation in saying, that I should look upon it as a decided improvement in University education. Whether it should be effected now, or when another incumbent shall be appointed to the Chair, it is not for me to decide; but, at whatever period it can be effected, I shall consider it an advantage.

Would you make the new Chair an imperative class?—Undoubtedly. If this were effected, we should then have in the University three Surgical Professors; and I think a very great improvement might be effected in the mode of teaching Clinical Surgery. If Surgical-Clinical wards were set aside in the Infirmary, in the same manner that Medical-Clinical wards are taught, and if the duty in these wards were done in rotation, in the same manner as the duty in the Medical-Clinical wards is, the students would see a great variety of practice, which is exceedingly desirable. If these improvements were to take place in the Constitution of the University, and in the number of Professors, I conceive that the whole of these should be added to the Medical Faculty, as examiners for a degree, which should then be granted in Surgery. I see no reason why this University should not, like many others on the Continent, and like that of Glasgow, grant the degree of Master in Surgery. It would be creditable to the University, and beneficial to Surgery. All these Surgical Professors should be added to the Examinators for that degree, as is done in Glasgow.

When you speak of the degree of Master in Surgery, do you understand that to be quite distinct from the degree of Doctor or Bachelor in Medicine, supposing these are two degrees?—Entirely distinct: they are made quite distinct in Glasgow. I think the arrangement of this matter at that University is exceedingly good.

Would it therefore apply to students educated for the Practice of Surgical operations, rather than for Medical knowledge?—It is difficult to separate Medical and Surgical education; but those students who wish to practise Surgery more particularly, would certainly take that degree.

When you speak of three Professors of Surgery in the University, do you include the Professor of Clinical Surgery?—I do, and of Military Surgery, and the supposed new Professor of Surgery, as separated from Anatomy.

Would you give the Professor of Clinical Surgery, properly so called, less than he has to do at present?—Scarcely less. At present he is entitled, by the regulations of the Managers of the Infirmary, to lecture constantly with the ordinary Surgeon of the Hospital. He should, on the arrangement I have proposed, lecture constantly with the other Professors of Surgery in the University. He has one half now; he would have one third in that case.

In that case, would you superadd to the duty of each of the two other Professors, a duty equal to the whole which the Professor of Clinical Surgery performs?—Equal to the whole duty he does at present, certainly. I would do no more, with respect to the Surgical Professors, than has always been done, with the greatest advantage, to the Professors of Medicine. I should observe, that although the Professor of Clinical Surgery has, at present, only half the duty, yet frequently the Ordinary Surgeon declines lecturing; and then he has the whole to do.

University of Edinburgh.

Professor Graham.

7 November 1826.

Would you prefer, if there were a distinct Professor of Surgery, that he and the Professor of Military Surgery should take the duty of lecturing in rotation upon Clinical Surgery, to the present mode, by which only one Professor lectures upon Clinical Surgery?—I would greatly prefer it, for I think it is a most important branch of medical education; and, by the arrangement proposed, the student would see a variety of practice.

Would you then dispense with the Professor of Clinical Surgery?—I would make a third Professor, whatever he may be called, in order to get this rotation.

Might the Professor of Anatomy, the Professor of Surgery, and the Professor of Military Surgery, give Clinical Lectures on Surgery, in the same manner as the gentlemen of the Medical Faculty give lectures upon Clinical Medicine?—The only objection to that arrangement would be, that the Professor of Anatomy has to make so much preparation for his teaching, that he could not afford time. He has to prepare his subject for lecture, and as that must be done on the day of his lecture, and before the meeting of his class, he could scarcely find time for Clinical teaching. It is on this account that the Professor of Anatomy has scarcely ever lectured upon Clinical Medicine, his time being so fully occupied in dissection, in particular previous to his lecture. In reading over the notes of my evidence when last before the Commissioners, in regard to the winter course of Botany which I propose to give, I find I was not sufficiently full, and might be misunderstood. I ought to have stated, and indeed I meant to do so, that in giving a winter course, I do not propose to subtract any part of the subject of the summer course. This I propose to be conducted as heretofore, and do not intend to cut out any portion of it; I would merely prolong some branches of the subject, and lead on to others, which I have not time to allude to in summer.

Will the proposed course be entirely additional?—It will be entirely additional, and I do not consider myself entitled to give it, without the sanction of the Senatus Academicus.

Have you applied for their sanction?—I have not. I have alluded to it at the Senate table. I do not know whether it might not be expected I should say one word as to the Herbarium which is connected with the University. There is scarcely any Herbarium. There are many dry plants without arrangement, and which are of very little value; at present I am endeavouring to form a Herbarium; and I have no doubt, in a short time, in consequence of steps that have been taken, both in the University and out of it, there will be one accumulated. The formation of a Herbarium is a serious labour. I merely throw out this suggestion, that the Commissioners may consider whether some little assistance should not be given to me. The mere manual labour and time occupied in the arrangement of a Herbarium, are so serious, that the Commissioners will consider whether, as in the case of the Professors of Anatomy and Natural History, an assistant should not be allowed me.

Perhaps I may just allude to the two classes of graduates we shall have hereafter at this University. We shall have a class after three years' medical study, together with the degree of Master of Arts; and we shall have a class after four years' medical study, without any other previous University education being rendered imperative. In this way, we shall have it in our power to contrast the acquirements of these two classes; we shall ascertain if the previous education is so likely to increase the capability of acquiring medical knowledge as sometimes has been thought. In short we shall have some candidates placed exactly upon the footing of the graduates of other Universities, which require only three years of medical education, and a previous course of general study.

If a certain portion of preliminary study were deemed necessary to entitle a person to a Medical degree, would Dr. Graham state the principle on which it was supposed, that by requiring a previous literary or scientific education, any part of the professional education would be rendered less necessary?—It was the impression of several members of the Senatus, that, in consequence of their previous study and habits of thinking, the students would be able, in a shorter time, to acquire the medical information that was necessary; that they would be able to acquire the same amount of medical knowledge in three years as they now do in four, in consequence of previous habits formed during their study for the degree in Arts.

Does the regulation extend to those who have taken the degree of Master of Arts in this University?—It does.

Then, by that regulation, does the present distinction of Master of Arts, obtained at this University, dispense with one year of medical study?—It does. I may state, however, that though the opinion, as stated above, was that of many members of the Senatus, it was not mine. I think, in no case should a man devote less time than four years to the study of purely medical knowledge.

Does medical attendance at any other University count, in taking the Medical degree?—Certainly. We require only one year of attendance in this University; all the others may be spent elsewhere.

Must it, however, be in a University, and not in any other Medical School?—Not in any other Medical School.

377

University of Edinburgh.

Edinburgh, Friday, November 10, 1826.

The Right Honourable LORD BINNING in the Chair.

William Wood, Esq., Fellow of the Royal College of Surgeons of Edinburgh, called in and examined.

W. Wood, Esq., Surgeon.

10 November 1826.

Are you Fellow of the Royal College of Surgeons, and in practice in this City?—Yes, I am.

Have you turned your mind to the education of gentlemen, intended to go into the Medical profession?—Very much, of late years.

Have you considered the course of education that ought to be followed by gentlemen going into either branch,—that which is merely Surgical, or that which is more strictly Medical?—Yes.

Are there any suggestions which you have to make as to any improvements which you think might take place in the education of Graduates at this University, more particularly with respect to their previous education, if you think any such improvement is at all required?—I must claim the indulgence of the Commissioners, as I was called upon, rather unexpectedly, to appear to-day before the Commission, having been summoned to attend next week; and I have not had time to look over a few notes that I had made. With regard to the education of Graduates at this University, I am certainly of opinion, that, for many years past, the regulations which have been enforced, have been defective. These regulations have been in existence, with very little change, for about fifty years, and they appear to me to have been defective. Alterations, in some respects remedying these defects, were made in 1824, which are not yet brought fully into action; but still they appear to be deficient. The principal defect of the regulations, both those which were made formerly and those which are now enacted, seems to me to consist, in not requiring a proper preliminary education, either before persons become students of Medicine for a degree, or before they pass as Doctors of Medicine. By the old regulations, the only thing required was, that the young men should know as much Latin, as would enable them to answer questions *vivâ voce* in their examinations upon professional subjects. They were likewise required to write their Theses in Latin; but that, in many cases, was evaded, either from indolence or want of knowledge; and they got their Theses written in Latin for them: so that there were no steps taken to secure a proper knowledge of Latin, unless it be considered that the answering of questions is a sufficient test of their Latinity. By the new regulations, I observe that, at a private examination, previously to their being examined upon strict professional knowledge, the candidates are to be tried as to their knowledge of Latin. So far it seems an improvement. But I would remark, with the exception of Latin, there is no regulation made to secure a knowledge of any of those branches of education, which I look upon as necessary for a Doctor of Medicine. There is no mention made of *Greek*. I conceive every man, who is to be a Graduate in the University of Edinburgh, or of any other respectable College, ought to have a knowledge of Greek. I do not mean to say that a man cannot practise Medicine in any of its branches who has not learned Greek; but I think his acquisition of professional knowledge will be much facilitated by it; and his education will not be considered as perfect, and he will not hold that respectable situation among medical men, or in society, which a Graduate of this University should hold, without a knowledge of this language. With regard to the Modern Languages, I do not know that I have to say any thing, except that I look upon French as indispensable; I believe it is generally attained by the students. I think German and Italian would be useful accomplishments, but I do not think that they should be made essential. I look upon a knowledge of Mathematics as quite essential, before a young man enters upon his Medical education. It is not possible for pupils to pick up a knowledge of Anatomy, Chemistry, or any of the other branches, without a proper knowledge of Mathematics. Next to Mathematics, I conceive Natural Philosophy to be quite essential. I conceive that every Medical man, and particularly every Doctor of Medicine, ought to have a knowledge of Natural Philosophy, to enable him to understand professional subjects, particularly Physiology. There are two other branches which I consider likewise that a Graduate of the University ought to be acquainted with; I do not call them preliminary exactly, for perhaps it were better they were not taken at so early an age as that at which young men generally begin to study Medicine; I allude to *Logic* and *Moral Philosophy*. I conceive it to be of importance that a medical man, obtaining the highest honours in the profession, should understand Logic and Moral Philosophy. My reason for not mentioning them among the preliminaries is, that I think it would be more advantageous that Moral Philosophy should be taken at a more advanced age; and perhaps Logic is somewhat in the same situation. I consider it a defect in the regulations now in existence that they do not enforce attendance upon these.

Are the Commissioners to collect it to be your opinion, that though not essentially necessary to enable a Physician to practise, yet that it would be essentially beneficial that every person, previously to receiving the degree of this University, should have a good general education in all its parts?—Most decidedly; but I would like to qualify this answer: for some of the branches I look upon as essential for a Surgeon also.

Will you have the goodness to mention what they are?—I conceive Latin and Greek, and I may mention French, as it is an accomplishment so generally acquired; Mathematics and Natural Philosophy, to be essentially necessary; I would almost add Logic and Moral Philosophy. I really think the education of a Surgeon very defective indeed if it does not include these branches. In speaking of Logic and Moral Philosophy, I should mention that I speak with decision; because these branches were not so commonly taken in the days I studied, and I have felt the disadvantage of not having got them, as I might or should have done.

By what regulations would you propose to secure the acquisition of these attainments?—I should hardly conceive it necessary to insist that Greek, Latin, French, Mathematics, and

University of Edinburgh.

W. Wood, Esq., Surgeon.

10 November 1826.

Natural Philosophy, should be got at a University. I am afraid, in some instances, it might bear hard upon the funds of young men. I think, with regard to that, a young man should either be Master of Arts,—which would secure his having got the knowledge required,—or show, upon examination, that he has the knowledge to enable him to be Master of Arts, though it may not have been got at a University. My reason for stating so is, that there are many situations, as in Perth, Inverness, and other places, where a knowledge of those branches may be attained by a young man, without leaving his home; and he may get that knowledge, without which he could not enter as a candidate; and it would be hard to make him pay the expense at a University. Logic and Moral Philosophy would require to be received at a University.

With regard to the latter class—of Moral Philosophy—would you wish to see it in any way connected, as a class for Medical Students, with the study of Mental Diseases?—I should think it extremely useful to the students; but Moral Philosophy is a general course, and they might be prepared, by studying it, to enter upon a course, to be given more distinctly, on Mental Diseases; still I think the education would be much improved by a general course of Moral Philosophy.

If that preliminary education, which you propose, were required, either by examination, or by taking the Degree of Master of Arts, do you think it would diminish materially the number of graduates in this University?—I do not know what the first effect might be, but I am satisfied, in my own mind, it would not be the ultimate effect.

You do not think it would diminish them permanently?—I do not think so. I would allude to a fact, as a part of the grounds on which my opinion is formed, which occurred in the College of Surgeons, to which I have the honour to belong, and of which I was President two years ago; it is from that circumstance that I have turned my attention particularly to the subject of Medical Education. The College of Surgeons, twenty or thirty years ago, were very loose in their examinations for Diplomas, and required little education from the candidates; and the number of Diplomas taken was small. I meant to have had a more accurate account drawn up of the numbers, and I was just going to get it, when I was called upon to appear before the Commissioners to-day; but the facts I shall state are accurate. I took a list of those gentlemen who received Diplomas from 1800 to 1804.

What was the state of the regulations at that time?—Before 1804, they were very incomplete, and examinations were not carried on in the same accurate way they have been since. From 1804 to 1806, I date the first great improvement; and it has been going on gradually since, down to the present time. The regulations for study have been very much extended, and very much improved.

Do the regulations, as they now stand, require all the branches which you have mentioned as necessary?—With regard to preliminary education, I must be allowed to say they do not positively require it; I am satisfied the regulations of the College of Surgeons are not yet what they should be, nor what they will be; but the reason of that was, that, during the war particularly, there was a great demand for Army and Navy Surgeons; and though we allowed no man to join these services, under our Diploma, whom we did not think qualified, we felt ourselves a little hampered in extending the course of study so much, or so repeatedly, as perhaps should have been done. I may likewise state that the College, having laid down a course of education before 1824, equal or superior to the regulations for the course of study for graduation here, we felt a difficulty in going beyond that. By our present regulations, we have pointed out the course of studies which is considered essentially necessary, and the following recommendations are given:—"The College cannot omit the opportunity which now offers, of impressing upon the minds of parents and others, how necessary it must be for the interest of the public, and of what importance for the future comfort and respectability of the individual, that every one who applies to the study of Surgery should have obtained the benefit of a liberal education." * * * "The College have had much satisfaction in observing, for a series of years, the gradually increasing knowledge and acquirements of those who present themselves to the College for Surgical Diplomas; and they are inclined to hope that Medical Practitioners, in every part of the country, will be disposed to concur with the views of the College, by using all their endeavours to encourage the study of the *Latin, Greek, and Modern Languages, of the elementary parts of Mathematics and Natural Philosophy, of Natural History and Botany,* to the young men who, in being placed under their care, are destined to follow the practice of Surgery; and the College request Candidates to observe that, at the commencement of every examination, they will be required to translate into English some portion of a Latin Medical Author." In point of fact, some young men have been rejected for want of knowledge of Latin. I mention the fact, to show the difficulty which we have had, and the necessity there is for enforcing Latin. A good many of our rejections are for the want of a knowledge of Latin; we begin an examination in Latin, and if the candidates do not understand and construe it, they are sent back to their studies. I quote the numbers, to show the grounds on which I am led to believe that, by increasing the education and the difficulties to obtain Diplomas, the value of our Diploma has risen, even much beyond what we could have expected. In 1800, 40 young men took the Diploma; in 1801, there were 36; in 1802, there were 51; in 1803, 49; in 1804, 47; making altogether, in five years, 223. In the five years, from 1810 to 1814, there were 448; and in the five years, from 1822 to 1826, 656,—the numbers having been trebled in 20 years. We expected a great defalcation after the peace; and perhaps for a year or two after, there were fewer; but they have risen again in number, and the last year was the largest we have had; we passed 159. When we were calculating the funds we should require to purchase a Museum, we took a prospective view of what the numbers of our candidates might be, and we calculated they would fall to 80; instead of which, last year we passed 159.

379

University of Edinburgh.

W. Wood, Esq., Surgeon.

10 November 1826.

Will you mention the date of the last regulations enacted by the College of Surgeons?—The last edition was in September 1826.

When did the stricter regulations commence their operation?—They began to be improved in 1806, and have been progressively increasing for a good many years. I cannot mention the exact dates; the education has not been a great deal increased for some years; it stood very high a good many years ago, at least equal to the education of a Doctor of Medicine in this University, under the former regulations.

Can you furnish the Commission with the different editions of the regulations?—Yes, most undoubtedly; and also with a more complete list of the numbers who have taken Diplomas.

From the facts which you have ascertained, are you satisfied that the strictness of the regulations has not tended to diminish the number of Diplomas?—On the contrary, I conceive that from the time the education and the strictness of examination have been increased, the Diploma has been raised in the public estimation; and I may perhaps add, that it is owing to its standing high in the public estimation, that so many apply for it; for the real legal privileges conferred are very trifling. It is looked upon as a proof that the young man has passed his examination, and has had a full education. The real privileges are confined to a few; but many young men who go all over the world, take it.

Will you state what the privileges actually are?—I know of no legal privilege, except that there are five or six counties around Edinburgh, in which those taking our Diploma have the exclusive right of practising; which, by the bye, is not enforced. I may, perhaps, mention another fact; I happen to know, that in consequence of the extensive education required, and the value attached to the Diploma, in some situations it has been declared equal to the Diploma of Doctor of Medicine in this University. I can quote a particular instance of that: a Dr. Musgrave was here the other day, who was a Graduate in Edinburgh. Having taken the degree of Doctor of Medicine, he likewise took the Diploma of the College of Surgeons. His own opinion was, that the examination in the College of Surgeons was better calculated to try his merits and demerits than the other; such he holds to be the nature of the examination. He went to the West Indies, to Antigua, where he found a regulation, that no man should practise there who did not hold the degree of Doctor of Medicine. He rose himself to be one of the Council of Antigua; and, by representing the course of education required by the College of Surgeons here, and the nature of the examination, it was enacted, that the Diploma of the College of Surgeons should be held equivalent to that of Doctor of Medicine.

Do you attribute the increased number of candidates for this Diploma to any other causes than those you have already adverted to?—I am not aware of any other. I would mention, that our examinations are pretty strict; that, in the last five years (and I cannot give any statement of the earlier periods, for we did not then keep the lists so accurately of those who were rejected), 756 applied for Diplomas—656 received them; so that 100, or between a seventh and an eighth of the whole, were remitted to their studies.

Do you happen to know, if a considerable number of those who have taken the Diploma from you, have likewise got the degree of Doctor of Medicine in the University?—A great many: I cannot tell the exact numbers of those who take the Diploma of Surgery in addition to the degree of M.D.; but many do so, just before the last examination for the degree, so that they enter upon their Thesis, *Chirurgus*, which is considered by them a feather in their cap.

Have you known instances of persons being rejected by your College, who had been passed by the Medical Faculty, or *vice versâ*?—I have known instances of young men, who had passed all their trials for a Degree of M.D., except the last, which is rather reckoned a matter of form; and they were sent back by the Surgeons, after coming to that stage: they came to us before they were actually capped; but they were remitted by us. I believe there are several such cases.

Do you know if there are any cases, on the other hand, of persons who had passed their examination before the Royal College of Surgeons, and who had afterwards been rejected by the Medical Faculty?—That I cannot state exactly; for, of course, it is kept as private as possible, who those are who are remitted at the University. There might be, and probably were, cases which I never heard of.

Have you observed, in practice, whether men, possessed of extensive knowledge of Science, are in use to get before others, who confine themselves entirely to Medical studies?—They are much better qualified to rise in the profession, and do so; but there is a little difficulty in seeing the grounds on which the public prefer one man to another. I never met with a man of extensive scientific and literary knowledge, who was not much better qualified to practise Medicine than one who was unacquainted with it.

But, in point of fact, have you observed that men of science do get on in their profession with greater success than those who confine themselves to strict Medical study?—Yes, I would be disposed certainly to say so. There is the case here of Dr. Gregory, and Dr. Thomson, and Dr. Abercrombie, &c.

On the other hand, may there not be exceptions?—There may be. I am not aware that I could quote an exception; but there may be. The public, I do not conceive, pitch always upon the man whose attainments are the best.

Supposing the system of Preliminary Education, which you propose, were introduced, would there be any danger of a greater number of persons obtaining the inferior licences to practise, for which such qualifications are not required, than at present?—I am not disposed to think there would; I think the College of Surgeons here would probably continue to increase the value of its diploma; and, instead of a simple recommendation of some branches, if an alteration were made in the University, they would make an alteration also; and, in that case, I do not see that there would be any increase inthe number of inferior practitioners. I think

University of Edinburgh.

W. Wood, Esq., Surgeon.

10 November 1826.

practitioners would continue to take the degree at the University, or the Diploma at the College of Surgeons. That there will always be men practising, without the one or the other, I am quite satisfied; there are many such in extensive practice.

Do you consider the character and interest of the College of Surgeons would unite in leading them to enjoin the same course of Preliminary Education which the University might prescribe?—I am disposed to think, and I hope, they would. I conceive that to maintain the character of the body, and the respectability and value of the Diploma, they would, and should do so; they ought to do so, and from what I have seen of their conduct, I think they would.

From what you state, so far as the interest of the College is concerned, you have no reason to apprehend that additional regulations would at all tend to diminish the number of those who take your Diploma?—I do not believe it. I know the College of Surgeons, before they had experience, resolved, at all hazards, to do what was right; and having done so, they have not found any injurious consequences; it has increased its character and its funds.

Do you apprehend, if the additional regulations you have been recommending were carried into effect, that the number of those who practise without Diplomas of any sort might be increased?—I rather think not; but I am supposing that all the Universities in Scotland were put upon a similar footing. I do not know what the effect might be, if other Universities granted degrees differently. I think the great mass of the people would still apply to those who are known by their Diploma of M. D., or their Diploma from the College of Surgeons, as men of education and skill, although men were to offer to practise with less knowledge.

Are the Commissioners to understand from you, that you consider that it would be of advantage if other Universities were not to follow a less strict mode?—Certainly; but even then I should not apprehend a bad consequence to the University of Edinburgh, from its going before another University, in extending the education of its Graduates. I think by increasing the reputation of Edinburgh Graduates, even if other Colleges were to grant degrees on a less strict course of study, no injury would be done to the University of Edinburgh; for I conceive the value of the Diploma will rest upon the full course of education given; and though the University of Edinburgh for a time might continue to do with the present system, I do not think it would continue to hold its station long.

Do you know if the Royal College of Surgeons in London require as much previous education as the Royal College of Surgeons of Edinburgh appear to do?—They do not, as far as I know; they only require the Latin; but I do not remember anything about Greek, or the other preliminary branches; but the College of Surgeons of London does not stand so high in this respect. I know the education which is required by the Royal College of Surgeons in London, is inferior in point of extent, both professionally, and I think with regard to its recommendations of preliminary education.

Are Latin and Greek, as preliminary education, required in Dublin?—In Dublin they require a great deal more than in any other place I happen to know. I have a quotation, which I have written out, bearing on the subject, from a book of Dr. Colles, Professor of Surgery at Dublin, and one of the first practitioners there; and it will show his idea. It is contained in a preliminary address to the students, in a work which he published. He says, "On the necessity of classical information it is needless to dwell, because, in fact, no person can be admitted a registered pupil of the College of Surgeons, until he has undergone a public examination in Greek and Latin before the Court of Examiners: but as the course, appointed to be read for entrance, comprises little more than Virgil, Sallust, and Horace in one language, and Lucian, Xenophon, and Homer in the other, I would recommend it to you occasionally to refresh and extend your knowledge of the Classics at your leisure hours." There is likewise a quotation I have taken, as to Mathematics and Natural Philosophy, from the same author. Speaking upon the subject of Preliminary Education, "The College of Surgeons of Ireland," he says, "has not yet fixed upon a Scientific, as it has on a Classical course." He therefore recommends attention to Mathematics, Natural Philosophy, &c.; and he adds, "Be assured that no man can know his own profession perfectly, who knows nothing else; and that he who aspires to eminence in any particular science, must first acquire the habit of philosophizing on matters of science in general."

Is there any difference in the expense of education necessary for obtaining the Diploma of Surgeon, and the expense of obtaining the degree of Doctor of Medicine?—With regard to attending the classes, I conceive there is very little difference; excepting only, that many of the classes, indeed all of them, may be taken without the walls of the University, where the fees are rather less. The College of Surgeons admit the Lectures of Fellows of the Colleges of Physicians and Surgeons of London, Dublin, Glasgow, and Edinburgh. Their fees here are generally less by a guinea: the general rate of fees in the University is four guineas; the fee for private lectures is generally three. But there is a considerable difference in one respect: there is only £6 paid to the College of Surgeons by the young men for the Diploma.

What is the fee paid upon the degree of Medicine; is it £13?—It is 13 guineas, or pounds, independently of the stamp; then there is the expense of the Thesis; I may mention, that the College of Surgeons have not raised the fees for the Diploma, except a few shillings, for many years. The object of the College has always been, that the money paid by the students should be laid out in acquiring information, and not in increasing the funds of the College, and they have taken as little as possible. I think, for 20 or 30 years, it was £5 some odds, being Scotch money converted into English.

Is there any stamp duty paid for the Diploma of the College of Surgeons?—None.

To what purpose is the fee applied that is paid for your Diploma?—It goes to the funds of the College of Surgeons; from which two guineas are payable to each set of Examinators (four in number) for each sederunt, of two hours generally. The funds of the College are

University of Edinburgh.

W. Wood, Esq., Surgeon.

10 November 1826.

increased certainly by these sums of money, but of late years their attention has been turned to the object of having a Museum of Pathology and Anatomy. The College of Surgeons has spent nearly £6,000, of late years, in acquiring this collection, which, during this winter, is to be put in such a state as to be open to all Physicians, Surgeons, and Students, and in fact to medical men generally, under proper regulations. Above £5,500 has been already laid out; and we are likely to acquire, but have not yet got it made over, the collection of the late Dr. Barclay. The only difficulty is, we have not got funds to provide a proper place for its perfect exhibition.

Do you require more than three years' study of Medicine?—Only three years.

Do you know if, by the new Statuta of the University, four years are required?—Yes, with some exceptions I believe.

Do they require one or two more classes than you?—I believe they come now to be nearly the same in number, by the new regulations; there was a little difference formerly in favour of the College of Surgeons.

Does the College of Surgeons require Clinical Medicine?—No; we recommend, but do not require Clinical Medicine.

How many courses of Anatomy do you require?—Two courses, but that is lately; that is our last regulation.

Is it required of all your candidates, that they should have served an apprenticeship?—No; by our old regulations a year less of study was required of a person who had been apprentice to a Surgeon; that was the law for some time, but it has been done away with now, and we require three years' study from every one, whether apprentice or not.

Are all your candidates bound to serve an apprenticeship?—No, the greater proportion do not.

Are three years, spent in Surgical and Medical study, considered as sufficient to complete the education of a Surgeon?—By our present regulations.

Of those who are remitted, are the greater number those who are educated in England, than in Scotland or Ireland?—I cannot answer that precisely; I should think not.

Have you had reason to observe that young men, who receive their previous education in England, were better qualified to pass examinations, than those who receive their previous education in Scotland or Ireland?—I cannot say that I could condescend upon that particularly; but I would be rather disposed to say, that those from England are the best classical scholars, and I have found that the men who are best informed in the classics, pass their professional examinations best: this I state from the experience I have had for eleven years, as Examinator to the College of Surgeons. A young man who passed his trial in Latin, and who seemed to have the best classical knowledge, was generally found to pass his Surgical examination best: I may state that safely.

Will the education which is required for four years, by the new Statuta, be more complete than what you require in your College?—It will be more so, in point of time, but not more in the number of courses. I forgot to mention a fact, as to preliminary education, perhaps bearing on this subject; that a person who has got the degree of M.D. in our University, is not qualified, if he has only followed the regulations necessary for obtaining that degree, to enter into the Army. The Army require a knowledge of Greek; it is said in their regulations, to be essentially necessary; and I heard Sir James M'Gregor say, that they give their candidates Celsus to read with a Greek quotation in it, to ascertain their Latin and Greek knowledge.

Having given your opinion on the subject connected with previous education, would you have the goodness to go on, and offer any other suggestions you may have to make, with regard to Medical education generally in this University?—With regard to professional education, perhaps it would be better to speak in reference to the regulations that were last passed; they seem to me still to be defective. I think the period of study is too short; I conceive that four years, in the way that our session sits, are too little. I believe, by the present Statuta Solennia, it is required, that there should be four winter sessions, and one summer session for Botany; but I am disposed to think, that either five winter sessions should be required, or four winter sessions, with two summer sessions, but lengthened beyond their present period. I conceive three months too short for a course of lectures in any of the branches that are required; and if summer sessions are to be taken, they ought to be lengthened; and I think it would require four winter sessions, and two summer sessions, to enable students to take, with advantage, the necessary course of studies.

What length would you require for the summer session?—Five months.

What are the classes that occupy less than five months?—Botany is less than that: there are five classes pointed out, of which students may select two, which are allowed to be of three months' duration; these are Practical Anatomy, Natural History, Medical Jurisprudence, Clinical Surgery, and Military Surgery, which are ordered to be taken *per Curriculum saltem trium mensium.* I conceive, likewise, there is a defect in a sufficient number of courses not being required imperatively. I conceive that Surgery, even to Physicians, is a very important branch, and should be attended for six months; and I should certainly suggest that the lectures should be given by a Practical Surgeon. Clinical Surgery should be essentially necessary for the education of a Physician; and with regard to Dissections or Practical Anatomy, I think it should be essentially requisite; and three months are too little for the study of it.

Is Practical Anatomy required by the College of Surgeons?—Yes.

Would you think it advantageous to introduce a summer course of five months, supposing the winter courses to occupy six months each; or would you offer any suggestion to make it more practicable for young men to attend?—Either the winter course might be made nine

University of Edinburgh.

W. Wood, Esq., Surgeon.

10 November 1826.

months, and the summer course done away with altogether, or the winter course should occupy five months, and the summer five; but then there are some of the courses for which I reckon six months too short.

Which are they?—I think the course of Chemistry, including Pharmacy, is too short; at least, when I attended it, I found there was very little time to go into Vegetable and Animal Chemistry, which I look upon as an important matter; and if the whole of Chemistry and Pharmacy is taken into consideration, I think the present time allotted for it is too short. I conceive the session at present considerably too short for the Practice of Medicine; in my day, it was decidedly so; for Dr. Gregory gave a course of Practical Medicine for two years, and did not exhaust the subject; and that the session in general is too short, is a fact, I am entitled to say; because invariably it has happened, that, towards the end of the session, many of the Professors have found themselves obliged to lecture twice a-day; and it is very difficult for them to make up their lee-way. Lecturing twice a-day I conceive to be disadvantageous. I think that towards the end of a session, when a young man has been labouring hard, and when the points treated of are of considerable importance, it is crowding the subjects too much together; and the Professor cannot do justice to the students, by working two hours in the day, instead of one. It would be much more advantageous if the time were prolonged. I have stated, that I think Surgery should be an essential part of the education of a Physician; for I hold that a Physician or a Surgeon, to discharge his duty properly, and understand his profession well, must know all the branches. No man can be a good Surgeon who has not a competent knowledge of the education necessary for a Physician; and, *vice versâ*, I conceive that a Physician is much better qualified to practise, if he studies Surgery; for he has an opportunity of seeing and feeling the symptoms of disease, and he gets a better idea of the nature of internal, by having previously studied the symptoms of external disease; therefore I think Clinical Surgery an essential part of the education of a Physician.

Does the College of Physicians now allow its members to practise as Surgeons?—There was some regulation, but I do not know the tenor of it, by which it was provided, I think, that no man who entered their body, should be allowed to practise as a Surgeon. An alteration was made, but I do not know the full extent or intention of it,—I believe it was to open the door for that body to practise the minor operations. The College of Surgeons have the privilege or right of examining and licensing persons to practise Surgery in Edinburgh.

If Physicians and Surgeons should receive the same education, ought not the same number of years be applicable to the study of Surgery?—Yes, I think it should.

Do you think that your regulation, which requires three years' course of study, is deficient?—I think it deficient. I think it would be better if it were extended.

Is it your impression decidedly, that if a superior professional course of education were required by the University, for graduation in Medicine, the College of Surgeons would likewise follow the same principle in regard to these regulations?—It is my belief. One thing I certainly may state, that I conceive a man who receives the highest Medical honour (and no doubt the degree of M. D. should be the highest) should possess higher general Classical and Philosophical attainments; for his rank in society ought to be maintained, more by these, than by any decided difference in strictly professional education; for it must be very similar in Physician and Surgeon. In the present system, it does appear to me, that the full effect is not given to the teaching of Clinical Medicine, in our University, that should be. It would be of essential consequence, if there were a Professor of Clinical Medicine, who had no other class to teach in the University. I conceive the time that would be required to teach properly Clinical Medicine is so great, that I hold it to be incompatible with the proper discharge of the duties of a lecturer in the University, that he should also be a teacher of Clinical Medicine. Clinical Medicine stands in a particular situation: it requires daily attendance upon patients; it requires preparation of lectures, which are delivered at present twice a-week, which ought to be made, and must be made, from day to day; and though he only lectured twice a-week, it would be a vast advantage to the students, if the Professor met his class daily, and though he did not give a regular lecture every day, that he should have an opportunity of pointing out sudden changes in the symptoms of diseases, and of directing the attention of students more closely to these than he can do now. The students attend every day in the wards; the wards are so crowded that very few students see the patients, and it is difficult for them to come in contact with them; three-fourths of them seldom feel a pulse—they seem more disposed to write down in their note-books the remarks that are made, and the medicines that are prescribed; whereas, if there were more wards, or if the present were less crowded, and the Professor had an opportunity of directing the students' attention daily to those minute shades of difference in diseases, which frequently occur, it would be of vast importance.

Would you have one or more Professors of Clinical Medicine appointed?—I think it would be better if there were more than one. I think it would be of advantage to the student; the disadvantage at present is, from the crowded state of the wards by the students.

If there were more than one Professor, would not the students have the advantage of seeing a variety of practice?—They would see a variety; but I have a little difficulty in answering that. If there were an able man following a judicious practice, I think that, in the early days of a student, it would be better for him to see that, than be led to waver, by seeing more speculative practice.

Do you think then, that there is no advantage in the present system, by which students see a variety of practice?—On the contrary, I should say it is rather prejudicial; for at that period of his studies, a student cannot judge correctly; and it would be far better for him to get distinct ideas of practice, from a sound judicious man, who follows a certain routine of practice, than to see a variety among men who might be more speculative; but I would wish that the Professor who teaches him, should have a continued and extensive opportunity of

seeing practice. In most of the infirmaries abroad, they have a *Clinique;* but those who lecture on Clinical Medicine, are in daily attendance at the hospital, though they may not be giving Clinical lectures throughout the whole year.

Do you consider the class of Clinical Surgery as standing now on a satisfactory footing?—I do not, by any means; I think there are objections to the present system of Clinical Surgery. In the first place, there is a Professor of Clinical Surgery in the University; but it does not follow of necessity, more than it does with the Clinical Physicians, that there shall be patients for them to lecture upon. I believe there is a private arrangement between the managers and the Clinical Physicians and Surgeons, by which that difficulty is obviated; but I conceive it competent for the managers to shut their door to-morrow, and exclude the Clinical lecturers.

Do you, therefore, think it would be of importance to make a permanent provision for the Clinical Lecturers?—Yes; it is a defect, that there is no permanent establishment for lecturers on Clinical Medicine and Surgery. Another objection is, that the Clinical wards in the hospital receive patients with all kinds of diseases; and there are very often persons with infectious fevers, in the same wards with patients having other complaints; there being no separate fever wards for the Clinical Professors. The Ordinary Physicians of the house have fever wards, in which those cases that are infectious, are separated from others; they have no doubt side-rooms in the Clinical wards, or at least they had; I do not know if they have now. Whenever they could, they put persons having fevers into those rooms; but they are too closely connected with people labouring under other diseases, and infection might, and possibly may, have spread.

Would it be desirable if any of the Physicians in the Royal Infirmary were Clinical Professors in the University?—I consider it would be of extreme importance if they were, as the lecturers upon Clinical Medicine should be those who are daily in habits of attendance at the hospital.

Do you know, if that ever has been proposed?—I am not aware that it has; Dr. Rutherford was Ordinary Physician to the hospital, and took his turn of the Clinical lectures; but I am not aware, that, in my day, any of the Physicians there have given Clinical lectures upon the patients ordinarily received at the Infirmary. It occurs to me, there are some branches of knowledge which would be useful to the education of a Physician, which have not yet been introduced into the Statuta; I think Practical Chemistry, though perhaps it is not absolutely essential, would be of great consequence. I think also Natural History of importance; it is one of the five classes that are optional; but I conceive Natural History to be of so much importance, that I should be disposed, if possible, to recommend that it should be included in the Curriculum, as an imperative class. Natural History and Botany stand very much upon a footing, and it is of great importance to students that they should study both. In Botany, they not only learn the names of plants, but they have an opportunity of studying vegetable life, and the phenomena of the diseases of vegetables, and comparing their diseases with those of men and animals; and it is of great consequence that Physicians should have a knowledge of the habits and diseases of different animals, and an acquaintance with Natural History in general.

Would you include Comparative Anatomy under Natural History, or under the Anatomy of the Human Body?—I should think it would be better if it were included under the class of Natural History; at all events, it would load the Professor of Anatomy too much: and he is loaded too much already. Whether it would be possible to take it in under Natural History, I am not prepared to say.

When you say that the class of Anatomy is too much loaded already, do you make that observation with reference to the circumstance that the Professor of Anatomy teaches Surgery also?—Yes, certainly; but I think the time devoted to the subject he teaches, independently of Surgery, is too short for the course. The ticket bears, that he lectures upon Anatomy, Physiology, Pathology, and Surgery; but I am not prepared to say what part of the course is occupied by each. I conceive, with regard to Anatomy and Pathology, that the course of five or six months is too short.

Should you think six months devoted to Anatomy, with the exclusion of Surgery, sufficient to teach that science, and also to include as much of Comparative Anatomy as may be requisite?—If Anatomical Pathology is to form a part of the course, I think not: Anatomy and Anatomical Pathology require a full six months' course by themselves.

Do you think Comparative Anatomy should be taught in a separate class from that of Anatomy?—I think so, certainly.

Have you turned your attention to Medical Jurisprudence?—I have considered the subject.

Is it your opinion, that it would be beneficial to make attendance on that class imperative?—I consider it an important class; but I should feel it difficult to draw the line between that and other classes, for it concentrates the information that ought to be received from other Professors. Medical Jurisprudence should be one of the very last classes in order that ought to be attended; for I conceive it requires a knowledge of Anatomy, Chemistry, the Practice of Physic, Surgery, Midwifery, and the Diseases of Women and Children; so that, if Medical Jurisprudence should be made a part of the Curriculum, it should be among the very last classes.

Considering it, as you do, to be an important branch of Medical Education, do you see any objection to making it imperative?—I can see no objection, unless it excluded a class that might appear to me to be of greater importance; but it should not be introduced at the expense of other classes.

Do you consider Natural History more important?—Upon the whole I do; for I consider that though Medical Jurisprudence is very important, as concentrating information, yet Natural History is an additional branch of knowledge. Medical Jurisprudence seems a con-

University of Edinburgh.

W. Wood, Esq., Surgeon.

10 November 1826.

centration of knowledge which is acquired in other classes; but still it is of great importance to enable a man to direct his attention to points connected with the administration of justice. In the next place, it has appeared to me, for a long period of time, that the system of education might be very much improved here, if the classes were not only taught by lecturing, but by frequent examinations of the students; which examinations should not be optional, but imperative, both upon the Professors and the students.

Do you make that recommendation, generally, with respect to all the Faculties?—Generally, with respect to all the Faculties; but, at the same time, I may say, that I conceive it would require more than one hour a day in the session, to carry on both the lectures and examinations. The examinations should take place at an extra hour, and, I may state, I conceive this should be done without adding to the expense of the education. I think a Professor should both give the lecture and conduct the examination, without an additional fee. I mention that at present; because, in practice, at this moment, in one or two of the classes, there are examinations for which additional fees are taken. I think Dr. Monro has conversations or examinations on Anatomy, for which a fee is paid; and a system is commenced by Dr. Hope, the Professor of Chemistry, by which his Assistant examines upon the subject of his lectures; and, for these examinations a fee is to be received by the Assistant. I conceive the Professor ought to lecture and hold examinations, without increasing the expense to the students. There is another point I would mention: it appears to me it would be very important that there should be annual solemn examinations of those young men who are to take the degree of Medicine, to ascertain the progress they have made in the year that is past. At present, young men study for three years, and they undergo no examination, until they become candidates for their degree; and then the examination embraces the whole knowledge they have acquired in three or four years.

Do you mean that the examinations to which you refer, should be public?—I should rather conceive that they should be private, and they should be conducted by the Medical Faculty. One effect of this would be, to keep young men constantly on the alert, to be prepared for their annual examination; it would also prevent the hardship of a young man being examined upon all the branches of his education, taken during four years, with the chance of being sent back for a failure in one. Taking Chemistry and Anatomy, for instance, no examination takes place till the end of four years, when the candidate may be remitted to his studies for deficiency in the knowledge of Chemistry or Anatomy; whereas, if he had been examined at the end of the first session, and it had been ascertained that he wanted that knowledge, he might have been remitted with less hardship at the end of the first year than at the end of four years.

How would that operate in the case of young men who may not have made up their minds to become candidates for a degree, until they had studied four years; or, would you propose that the examination should embrace the whole of the Medical students?—That would be too extensive. If a young man had not gone through a regular course, and passed his examinations, he must run the risk of being sent back by the Faculty at the end of his studies. I would leave a discretionary power in the Faculty, that they should not refuse a man because he had not gone through these examinations; but I would encourage the thing as much as possible.

Would you propose that these examinations, at the end of each session, should be conducted orally, or in any other way?—I think they should be oral examinations.

Considering the number of students, would their examinations not occupy a great deal of time?—They would occupy, certainly, some time; but there is another way of ascertaining the progress of students, if this were found incompatible: young men might be obliged to write answers to queries; but they should be locked up, for I would not trust them to write out of doors. I think it would be of very great importance, that at least the private examinations, which are to ascertain a man's knowledge of his profession, should be in English. I know that there is very great difficulty in ascertaining the professional qualifications of young men, in a language which they are little accustomed to speak. So long as the Professor lectured daily in Latin, and the young men had an opportunity of becoming conversant with it, it was of less consequence; but it would be better for the public and the pupil, that his knowledge of his profession should be ascertained by examinations in English. I should have no objection to any *public* examination in Latin, if it were thought necessary to secure a proper knowledge of Latin in that way; but I feel satisfied, that ignorant men have got the degree occasionally, from the fact of its being difficult to ascertain if their ignorance arose from a want of knowledge of their profession, or from their deficiency in the Latin language.

In what language are the examinations conducted at the College of Surgeons?—Our examination begins with a trial in Latin; the candidates read a Latin work, Gregory or Celsus; then the Latin is thrown aside, and the rest of the examination is carried on in English. I look upon that as a matter of great importance.

Would you propose, in taking trials for Graduation, to omit, in the final examination, the subjects on which the students had given a satisfactory answer the first or second years of their course?—No, certainly not; I think it would be more easy to ascertain their knowledge, if they had been previously examined; but I would by no means hold that they were not to be examined again.

Would you make this last examination less strict than it is at present?—The examinations would not require to be so long, if it were known that the person had passed his examination before; perhaps he would be asked a few questions, to ascertain that he had not been idle; but the examination would be shortened greatly, and much facilitated. With regard to the present regulations of the Statuta Solennia, I think there is something objectionable in the exceptions which are made to the course of four years' study. One exception is, that when a young man has studied in a University for four years, and become a Master of Arts, he may

University of Edinburgh.

W. Wood, Esq., Surgeon.

10 November 1826.

be taken on trial for his Degree in Medicine, after three years' professional study. I do not think that should be: for, however qualified he may be in the Sciences and Literature, I conceive that four years, under any circumstances, are necessary for strict professional education. Then, with regard to the second exception, which is attendance upon an hospital for a year where there are eighty patients, I do not think that is expressed in such terms as to make it a good exception; for it is possible to suppose, that the attendance may be altogether independent of other instruction; for there may be nothing more than the mere seeing patients, and walking in the wards of the hospital. Besides, the attendance may be injudiciously taken; a young man may see an hospital before he commences his studies, or hears a single lecture; in that way, he would have only three years' professional study. I think that objectionable. If the attendance upon the hospital had been ordered to be taken later, and not more than two years from the time of his getting his diploma, it might do; but at present it is left much too vague; for if no lectures are taken, but the student merely walks the hospital, it should not supersede the fourth year of study.

If it is taken at an earlier period of Medical Education, would it comparatively be of little use?—Very little. There is likewise an exception of a year's service in the Army or Navy; I am not satisfied that that is sufficient service to do away with a year's course of study. If a man has studied only three years, and then takes a year in the Army or Navy, I doubt if that should supersede one year of study.

May not that regulation be partly founded on the circumstance, that the regulations of the Army and Navy require a greater course of study than the University regulations; and therefore it may be implied, that if he has passed the one, he must have had a very considerable degree of Medical Education, which would render three years sufficient?—It certainly may. There is another point, with regard to Medical Education, which appears to me to be of great consequence. I think there ought to be laid down a system of attendance upon the classes. I know a great evil has often arisen from young men coming, without good advice, and spending a great deal of time and money uselessly, in consequence of not being put in a proper course of study; and a great deal of good might be done, if a regular system of study were to be laid down, by which particular classes were to be taken in particular years. I am satisfied good would be done by that, particularly if all the Universities in Scotland were to pursue the same system. Perhaps the age of twenty-one, at which degrees may be taken now, is too early; twenty-two is preferable; I would not like to extend it much beyond twenty-two; for young men having finished their education here, may at twenty-two go to India, or they may be employed in the Army or Navy, and I conceive there might be hardship in sending them away without getting their degree. It would be hard, if they did not possess the Medical honours, merely because they were not above twenty-two, though they had had a full medical education. Another reason is, that they go abroad to finish their education; and it would be an unnecessary expense, if they were obliged to return to take their degree; it would be very hard, also, upon foreigners and strangers. With regard to the Statuta Solennia, they do not appear to me, to point out a sufficiently full course of education, as they now stand. I have suggested some classes which I thought should be added, because, at the present moment, I do not think the regulations laid down embrace a sufficiently full course; and I feel satisfied that few men indeed would finish their Medical Education, at the present day, by taking merely those courses which are pointed out in the Statuta Solennia. I never knew an instance, within my own knowledge, of a man who was satisfied with taking the course of education alone pointed out by the Statuta. I think that is an objection to them; and I think, if they were to get abroad, and into the hands of parents, they might lead to erroneous impressions. If the Statuta Solennia were contrasted, in the shape of a tabular view, with those of other Universities, they would, I conceive, be found extremely deficient. A parent, calculating upon sending his son to Edinburgh, would consider the expense; and if he counted only on those classes which are laid down by the Statuta Solennia, he would fall far short in his calculation; for I do not conceive that the course of education, pointed out by the present Statuta, is sufficient for a man who is to practise as a Physician. One course of Anatomy only is required. No man is qualified, however he may pass his trial in words, to practise, upon one course of Anatomy. It would be better if the Statuta contained the number of courses that were really necessary. It is a different point, whether it should be essentially necessary that all the education should be taken in the University, or if there should be an allowance for some part to be taken out of it. If it were thought necessary that the whole should be taken in the University, with such opinion I do not agree; for I think that some branches, as Practical Anatomy, &c., are much better studied out of it; then, I conceive, the University should be so shaped as to afford all the branches; and the Statuta should be so formed, as to show, upon their face, as much as was really required.

And as much as you think in practice is frequently taken?—With few exceptions. If allowance is to be made for education out of the University, it should be stated in the Statuta Solennia, that these may not lead to a wrong result. I do not believe any young man will ever offer himself,—I hope not,—to be examined upon these courses alone, which are pointed out by the Statuta. I may mention it as a singular fact, that in 1777 the regulations for degrees were nearly the same with those in force previously to the last regulations, and that hardly any alteration was made in the course of fifty years. But, in 1783, they were published in the newspapers over England, with a view to give information with regard to the course of study. I find it stated there, that "though a person may offer himself as a candidate for the degree in Medicine, after applying to the study of that science during three years, in this or some other University, it is to be observed that a considerable proportion of the graduates in the University of Edinburgh attend the Colleges of Medicine several years beyond that period." In short, it appears to me, that so far back as 1783, it was thought right to caution

University of Edinburgh.

W. Wood, Esq., Surgeon.

10 November 1826.

the public, that the education contained in the Statuta Solennia was not what was generally taken; and, I conceive, at the present moment, even with regard to the new Statuta, with few exceptions, a great deal more is generally taken than is required by them.

You have stated that it would be a beneficial alteration, if there were some order for the attendance of classes laid down;—although it might be easy to do that, with respect to students coming here to take their whole Medical Education, would there not be considerable difficulty in applying it to those who have already gone through a considerable part of their education elsewhere?—I would state, that the greater proportion of candidates for degrees are upon a Scotch education; and if all the Scotch Universities were placed upon one footing, the inconvenience would be small. There may be an inconvenience certainly; but that would be obviated by a discretionary power, in regard to those who had not taken their full education at Edinburgh; it might be made imperative on all those, who follow their studies in Edinburgh entirely. It would be so great a good, that I would adopt it with respect to all those who had a full education in Edinburgh, and give a discretionary power in the proper quarter, with regard to those who had not followed it entirely here. If such a regulation were adopted, and made public in the University of Edinburgh, it would produce a good effect on those who are educated elsewhere; they would be led to take their education a good deal in that order, if it were conceived to be a judicious one.

Would it not have the effect to diminish the number of strangers who come here to take their Medical Degree?—I think not, if there were a discretionary power given.

According to your view of the principles upon which Medical Education for a degree ought to be regulated, would you look to the value of the degree, in the first instance, and not to the number of those who might receive it, believing, at the same time, that the number would not ultimately be diminished by those improvements which you have pointed out?—Certainly.

When you speak of the Statuta Solennia not holding out what you conceive to be a sufficient course of Medical Education, do you mean, that all that should be so held out, should be made imperative?—Certainly. I think that there should be more made imperative than there are at present; for instance, our present Statuta prescribe one course of Anatomy, but that is insufficient. I would say, two courses of Anatomy. Whether that second course were to be taken in the University, or elsewhere, is a different matter. Then there are Clinical Surgery, and a course of Surgery separate from Anatomy, and Practical Anatomy—these I would make imperative. I mean, that the Statuta should bear, on their face, regulations for such a course of study as is absolutely necessary for a man to become a Doctor—my idea being, that if young men were to satisfy themselves by taking no other education than what is there mentioned, and were not to take second courses, either in the University or elsewhere, they would not be able to discharge the duty of a physician well; and if the young men had not done so for fifty years past, the Medical Degree of Edinburgh would not have stood so high as it does. It has been kept up, not by the fulness of the course of education laid down in the Statuta Solennia, but by the candidates finding out that they must take a great deal more study than is mentioned in them; and the graduates have been able to hold a rank in society, not in proportion to the education required, but to that which they had voluntarily taken.

Then, have you less difficulty in recommending such additional professional education being made imperative, because that you know it would be scarcely a hardship to any student, inasmuch as the greater proportion of them do, in fact, take a greater Medical Education than is enjoined by the Statuta Solennia?—Certainly. I never knew an instance of a man who satisfied himself with the education required by the Statuta Solennia.

Then, any objection on the score of expense does not weigh in your mind?—The expense would be very little increased; it might be, indeed, if all the classes were taken that I have mentioned; but it would not be very much increased even then, and certainly not more than it should be; and I conceive the young men would reap very great advantage from the money so laid out.

Do you think the class of the Practice of Physic ought to be attended two sessions?—Yes, I think it should: the time at present is too short; but even if it were lengthened, I think the class should be attended twice: I think the time for dissections is much too short—it is only three months.

Do you consider Midwifery essential?—Most essential.

Would you say it was essential, if there were two courses of the Practice of Physic?—A course of Midwifery and the Diseases of Women and Children is an essential branch, independently of the prolongation or repetition of the Practice of Medicine; for there are diseases peculiar to women and children, and there are diseases common to men, women, and children, which are modified by different states of the female constitution at different times, and by the state of infancy; so that, even if the time were prolonged for the Practice of Medicine, sufficient attention could not be paid to those minutiæ of practice which do occur from these modifications. It is essentially necessary, that Midwifery and the Diseases of Women and Children should be attended at a late period of study. It is necessary, that the students should previously have attended the Practice of Medicine, and should know the treatment of diseases which are there given. Then they would learn the modifications of diseases by the particular states of the female constitution, and by the state of infancy, &c. I look upon it as quite essential, that that class should be attended.

387

Dr. *John Abercrombie*, Fellow of the Royal College of Physicians, called in and examined.

University of Edinburgh.

Dr. J. Abercrombie.

10 November 1826.

Are you a member of the Royal College of Physicians?—I am member of both Colleges.

Have you turned your attention to the subject of Medical Education in this University?—When I was in the Practice of Surgery, I had occasion to superintend the education of young men, to a considerable extent.

Are there any suggestions you could offer to the Commissioners, upon the subject of Medical Education itself, or with regard to previous education, which you would think it desirable for gentlemen to possess, intending to graduate?—The first point which occurs to me, as worthy of attention, is an improvement in the preliminary education of Medical Students; particularly, that when they come forward, they should be very correctly acquainted with the Latin and French languages, with the Elements of Mathematics, and some competent knowledge of Greek; likewise, Natural Philosophy, particularly if it is taught in the more popular way, that is, by means of experiment, and not rendered abstruse by means of the higher Mathematics. There are two other branches, which appear to me to be of great importance, though I would not properly call them preliminary; I mean Moral Philosophy and Logic. With regard to Moral Philosophy, I think it cannot be studied with advantage, by a boy of the age of 16 or 17, when preliminary studies are gone through; and with regard to Logic, which is of great moment for a medical man, perhaps it cannot be studied with advantage, until the mind is previously well informed as to the facts of Physical and Moral Science, to which its rules are to be applied. So that those two branches might perhaps be called collateral, rather than preliminary, and should be taken as a part of the course of study, but at a more advanced period.

Would it be easy to take those two important branches, during the time the student is attending the Medical class?—I think, by a little arrangement, it might. The course is now increased to four years, and, besides that, I think a good deal more might be made of the summer course than is commonly made of it. If it were lengthened in some degree, some of the Philosophical branches might be taken in the summer.

Is that the substance of your whole opinion, upon the subject of Preliminary Education?—That is my opinion with regard to preliminary education; I conceive, there should be an accurate acquaintance with the Latin and French languages, and Natural Philosophy; and afterwards, as collateral branches, a knowledge of Moral Philosophy and Logic.

Does the expense of such a system of education operate on your mind as an objection to all those branches being required?—There are several points to be taken into consideration, with regard to carrying it into effect. Admitting, as a preliminary, the high importance of it, there are difficulties which have to be taken into account, I mean with regard to making it necessarily an Academical education. There is a considerable number of those, who come forward for studying Medicine here, who cannot attain it; for instance, those from the Colonies, and a great proportion of those from England, particularly that very numerous class who have spent a great deal of time as apprentices to Apothecaries in England. A great proportion of these spend from five to seven years, in doing the duties merely of shopmen, and not in any kind of study. It appears to me, that the only way of getting rid of that difficulty would be to make this preliminary education not necessarily an Academical one, and to leave them to get it where they can, but requiring them to produce satisfactory evidence that they have got it.

Would you require it to be ascertained by Certificates, or by Examination?—I do not know that it could be done by Examination; but perhaps it might be by Certificates from individuals in responsible situations, in the places where they come from.

Supposing such knowledge to be acquired by private study, what method occurs to you, by which it could be ascertained?—If it were acquired by private study, it could only be ascertained by examination; but it appears to me, that one effect of a change of this kind would be, what would be very desirable in other points of view, that respectable teachers of these branches would start up in the principal towns.

Do you think, then, that in practice it could be easily attained?—I think, in practice, the difficulties might be got over; but a very great difficulty, and a very great bar to the improvement of the education of medical men, in England particularly, is the Apothecary system, where they have an absolute monopoly, by which no man can be settled in England as an apothecary, without having served five years' apprenticeship. I am told many of them serve seven years, and that is at the most important period of their lives, from fourteen to nineteen, or twenty, when they are chiefly engaged in doing the ordinary duties in apothecaries' shops, merely in compounding medicines.

By that system, is no time afforded for the preliminary education which you contemplate?—They have little time for education of any kind, and in general they have very little opportunity in country situations; it appears to me to be a matter of very great moment, that something should be done to improve the education of the apothecaries; they are the ordinary Medical attendants upon all classes in England, in the earlier stages of disease.

Have the apprentices no practice in that way?—They have practice; but, as it is before they are acquainted with principles, it cannot be of much use.

Do you consider that the Apothecary system is a bar to a better education, and is the means of introducing a number of persons into practice in the country, who are not well qualified?—They spend a period of time in merely doing the ordinary duty of an apothecary's shop; which, if it were properly employed in studies, might lead to their being very well educated.

Does that practice, of employing apothecaries in England, arise from the difficulty of obtaining Medical degrees?—I do not know that it does, or that it is necessarily connected with that.

University of Edinburgh.

Dr. J. Abercrombie.

10 November 1826.

Does it arise from the expense of employing a regular physician?—It can only be said to be the practice of the country, in all ordinary cases; though I do not know that, upon the whole, the expense is much different.

If the law were strictly enforced, have not the Royal College of Physicians in England an exclusive monopoly of practice, so as to exclude all other persons practising as Physicians, unless they are Fellows of that College; or have licences from them?—That does not apply to the country of England—I believe it only applies to London; I rather think so, but the monopoly of the apothecaries extends over the whole of England.

Is it the practice, for the apprentices to follow out the line of Apothecaries, or do they become Graduates?—Some of them become graduates afterwards, and a considerable portion follow out the line of apothecaries.

You say, some of them become graduates; of what description do you mean?—Graduates of this University, I believe, many of them.

Do you suppose, that of the students from England who graduate at this University, a considerable proportion have served a previous apprenticeship?—I have no means of judging of the proportion; I am told a certain proportion of them have.

In recommending the study of Natural Philosophy, do you proceed upon the idea that it is necessary for enlarging the mind and preparing it for the reception of professional knowledge; or do you consider it in any degree subservient to the exercise of the Medical Profession?—There are a great many points in the Physiology of the human body, which are very much illustrated by the principles of Natural Philosophy. It may be of importance, in that point of view, and also very much in another, in being the means of obtaining a general enlargement of the mind, and habits of philosophical research.

Do you think that the structure of the human body can be sufficiently understood, without some knowledge of Mechanics?—I think there are many points in which it is of very great importance.

Do you conceive it to be of any use in the practice of Surgery—for instance, in the reduction of dislocations?—It is of considerable use in the practice of Surgery, and in the illustration of many parts of Physiology, as muscular action.

Do you think it of any use to be previously acquainted with Mechanics, with a view to the improvement of surgical instruments?—Yes; I think there are cases in which it may be of considerable use, in that respect also.

Will you have the goodness to proceed to state any additional suggestions, which you may have to offer, upon the subject of Medical Studies in this University?—The second point which occurred to me to be worthy of notice, is, that students coming here, at various periods of life, and with various degrees of previous education, often lose a great deal of time and labour, for want of direction in their studies at the commencement. I think, if it were possible to arrange a plan with that view, it might be of very great moment; for instance, a system of Tutors. There is a class of men in Edinburgh, who are particularly well qualified for it; they are men of great respectability, and very considerable acquirements, whose talents are at present turned to a use, which has become rather a subject of ridicule than otherwise; they are termed grinders. They are very well educated and intelligent men, at least the principal number of that class; and it has occurred to me, that if the young men first coming here, intending to study, were to enter themselves as pupils with these gentlemen, they would give them general directions what classes to attend, and would examine them, from time to time, upon the progress they are making. It might be of very great advantage.

What prevents them from doing so now?—I believe that some of them do so; there is nothing to prevent them. If it were taken up as a part of the regular system, perhaps it might be necessary to have them in some degree recognised.

How could these persons have any authority over the young men?—They would not have any authority; it would rest entirely upon the young men being desirous of instruction.

Would you, in such a case, have the Tutors appointed by the University?—I think it would be necessary to have a certain number recognised by the University, and that it should not be left optional to any person to start up in that capacity.

Would you render it imperative upon the student to have the assistance of such a tutor, as of the tutors at English Colleges, during the period when they follow their studies here?—There is a difficulty in making it absolutely imperative; it might be strongly recommended, but nothing can be made imperative, except on those who are to graduate; there is a very large class over whom there is no control.

Would you propose to make it imperative on those who are to graduate?—I do not know that it could be made absolutely imperative, but it seems a measure that would be exceedingly advantageous.

Do you consider it desirable, that recourse should be had to those persons when a young man enters upon his Medical study?—Yes.

Is it your belief, that if a certain number of respectable Graduates were so recognised as Tutors, and the system were strongly and generally recommended, and encouragement given to it, it would obtain in general practice?—I think it likely that it would.

In order to attain the object which you have in view, of preventing time and labour being misspent, and the evil which arises from the direction of their studies not being properly regulated, would you wish any particular order to be prescribed, in which the branches of Medical education should be pursued?—It is very desirable, and it might be done with regard to those who take a full course; but the difficulty is, that many do not take a full course here; some take a part at other Universities, and it must be left to them to make up what they happen to want.

For those who take their education in Scotland, would you wish to see such a regulation?—I think some regulation might then be exceedingly desirable.

Would you propose, that the same system should be enforced at the different Universities?—Yes.

Have you any farther suggestions to offer, in regard to any of the other branches?—With regard to Clinical Medicine, which is a branch of very great importance, the principal objection to the way it is conducted here, appears to arise from the great numbers who attend. The full advantage cannot be derived from this branch, except all the students have more or less an opportunity of seeing the patient, feeling his pulse, and frequently laying their hands on various parts of his body, so as to make themselves familiar with the phenomena of disease; and as, in every such institution, the first point, to which every other must give way, is the recovery and comfort of the patient, this cannot be done while there is any such considerable number. It has appeared to me, that the principal improvement that might be suggested on this branch is, that instead of having 150 students attending one course, there might be two or three courses going on at the same time, so as to divide the students, and to have separate sets of students and separate sets of patients.

Do you think the present mode, in the Edinburgh University, of Professors taking their turns in lecturing, is the best mode; or do you think it would be better to have one Professor of Clinical Medicine appointed?—This principle, which I have pointed out, is what occurs to me to be a very great improvement; the object would not be insured by a separate Professorship. I think there are people at present in the University, exceedingly well qualified to give Clinical courses; and some of them, who lecture in summer, have a great deal of time during the winter; and there are others, whose courses do not require anything but merely the reading of their lecture.

Do you think the present system of the University satisfactory?—I see no objection to the Clinical Professors being selected from among the other Professors; but my idea is, to have *three permanent Clinical Professors*, all lecturing at once.

Do you consider that the Royal Infirmary could afford provision for three sets of lecturers, consistently with the real objects of that Institution?—I think the Royal Infirmary could furnish patients, only it would require a new arrangement to be adapted to this new system; the accommodation for Clinical patients would require to be enlarged.

Do you think it would be of advantage, that the lecturer upon Clinical Medicine should be one of the regular Physicians of the Hospital?—There might be advantages in that; it leads to a system similar to what they have on the Continent, where a great Hospital, connected with a University, is completely under the care of the Clinical Physicians.

Would it at all impede the cure of the patients, if they were placed in Clinical wards, and this way subject to the examination of young men?—No; it is not found to do so, except they take more liberties with them than are proper; but there is generally a control over them in that respect.

Is there not a probability, that many of the cases will be more minutely attended to, if you multiply the number of Physicians who are to attend at the same time?—Yes, I think so.

According to the views which you take, of the principle upon which Clinical Medicine ought to be taught, you are neither desirous to have a number of patients under the same lecturer, nor a number of students attending him?—The smaller the number of students who attend him, the greater benefit, *cæteris paribus*, will they be likely to derive. The more the students are divided, the more will the advantage be derived from a Clinical course.

With a view to secure the division of students, and to prevent one Professor from having too great a number, is there any regulation that you would propose?—The simple way would be, if there were three courses of three months each, that it should be made imperative on them to attend one course of each, that would be nine months altogether, which is not unreasonable.

Then you would propose that all should attend each Professor?—Yes.

Would not that lead to the attendance of too great a number on each Professor?—It would lead to a circulation, for if there were 150 students and three Professors, each of them would have fifty.

Would that diversity of practice be advantageous to young men?—I think there are some advantages in seeing a variety of practice. There is another point, with regard to the Infirmary, which would facilitate a plan of this kind, and would not be injurious to the interests of the Infirmary: I understand it has frequently been proposed, but never gone into. What I mean is, that students should be allowed to take a six months' ticket for the Infirmary, after taking a twelve months' course; that is, for those who wish to continue a further attendance.

Do you understand that there is any reluctance, on the part of the patients, or the relations of patients, to being received into Clinical wards?—I am not aware that there is greater reluctance than that which exists with regard to going into an Infirmary at all.

Is there not more minute attention paid to the cases in a Clinical ward?—From the system of Clinical wards, there is an appearance of minute attention, which may rather be agreeable to a patient. I do not mean to say there is less real attention paid in the other departments.

Is not that a source of satisfaction?—That must be a source of satisfaction to them rather than otherwise.

Is it not to be presumed that a Clinical Professor would not insist upon taking a person into that ward, who might be injured by the crowd of attendants?—They generally choose the more acute cases.

Do they prefer singular and unusual cases?—They are unusual and acute cases which they prefer.

Have the goodness to go on with any other suggestions which you have to offer.—I might farther mention, that I consider Practical Anatomy of consequence: it is recommended in the last *Statuta*.

University of Edinburgh.

Dr. J. Abercrombie.

10 November 1826.

Should you think it desirable to have a distinct Professorship of Surgery?—There are two views to be taken on that subject: one is, whether it is proposed to educate actually Practical Surgeons, or to give that degree of Surgical knowledge which a Physician ought to have. If they propose to educate Practical Surgeons, certainly there ought to be a separate Professorship of Surgery.

Do you consider the present course sufficient to instruct a Physician in as much as is required?—It would be desirable that there should be a full and separate course of Surgery.

With respect to the classes that are left optional, are there any of them you would recommend to make imperative?—That comes to be a point of considerable difficulty. Some people have thought, and I have been inclined to acquiesce in that opinion, that whatever Professorships are instituted in the University, they ought all to be imperative; there are some of them which are of great importance, such as Practical Anatomy and Medical Jurisprudence, which are optional.

Would you wish attendance upon the class of Medical Jurisprudence to be made imperative?—It is a branch of very great importance and interest.

Are you not inclined to go the length of requiring attendance upon it as imperative?—My impression would rather be to make them all imperative where there are Professorships.

Military Surgery being a class instituted for a particular branch of Surgery, would you wish to make that imperative?—It is more particularly adapted to a particular class; it is an important branch with regard to many; but it is not of such general importance as to make it imperative on all.

With reference to the general observations which you have stated, would you wish to see the period for Medical study prolonged beyond the four years now required by the *Statuta Solennia*?—No; I think four years a sufficient time, but I think that more might be done in the same time by prolonging the summer courses.

During those four years, would you propose to take some of those classes to which you have now alluded?—Yes.

Would you recommend attendance upon any of them twice?—I think that one course of Anatomy is not sufficient for a Medical man; and Clinical Medicine, I think, ought to be attended more than once.

Do you think one session is sufficient for the Practice of Physic?—There would be an advantage, if there were a second course of the Practice of Physic likewise; but, in several of these branches, it does not depend so much upon what they actually learn at the time, as the general course of study to be followed out afterwards; Anatomy, for instance, must be actually learned at the time.

In your opinion, is there time, during the four years, to attend all the existing classes once, and those you have recommended twice, with advantage?—Perhaps not, except by prolonging the summer course, and putting more classes into it.

Is it by prolonging the summer course that you propose to accomplish your recommendation of making an attendance on all the classes imperative?—It could be only done in that way.

In point of fact, carrying your recommendation into effect, and supposing Military Surgery to be taken by those going into the Army or Navy, will it only be an addition of two classes which would be made imperative, there being two of the five now required?—Yes.

In your opinion, should Natural History be a part of the Curriculum?—Natural History, I think, is well worthy of attention as one of the preliminary branches; that would come in very well as a summer course.

Would you consider that any advantage was likely to be derived from the institution of a class for the purpose of lectures on Mental Diseases, connected with the Asylum, if it could be done?—I do not know; it comes in always as a part of the class of the Practice of Physic. I do not see much encouragement for a separate Professorship of that kind; but a *Lectureship* on that subject might be attached to the University with advantage.

Have you taken notice whether the class of Clinical Surgery is necessary for a Physician?—A great deal of important information may be derived from it; and for a Surgeon it is indispensable. The difficulty, with regard to a Physician, is in the multiplying of the classes; but I think a very considerable knowledge of Surgery is indispensable for a Physician, but not exactly in the same degree as is necessary for a practical Surgeon. A Physician may derive great and important information from a course of Clinical Surgery.

Did you study at this University?—Yes.

Did you study at any other?—My preliminary education was at Aberdeen.

How many years did you study?—The regular course for a Master of Arts, which is four years.

Do you conceive that you have received benefit from your previous study, even in a professional point of view?—I think so.

Did you pass your trial here for the degree of Doctor of Physic?—Yes.

And likewise before the College of Surgeons?—Yes.

Were the regulations of the College of Surgeons as strict as they are now?—The education required by the College of Surgeons has been very considerably improved from time to time; it is more extensive now than it was at that time.

Did you, at that time, consider the examination for the Surgeons' Diploma as more strict than that for the Medical degree?—I considered them both as very fair and strict examinations, but I cannot exactly compare the two together upon that subject; it may be right to state further, that I sat for ten or twelve years as an Examinator at Surgeons' Hall, and I had a full opportunity of knowing the mode of examination.

Has it become more strict than it was at the time you obtained your Diploma?—Perhaps

391

University of Edinburgh.

Dr. J. Abercrombie.

10 November 1826.

it is; I think it is, upon the whole, a very strict examination; the Latin language has been added.

Do you think that examination affords a satisfactory test of the Classical attainments of a young man?—As far as the Latin language is concerned, it affords a fair test that he is capable of reading one of the standard Medical Authors.

Do you think it affords a better test of the candidate's knowledge in Latin than an examination upon Medical subjects in Latin would do, such as was practised when you obtained the degree of Doctor of Physic?—A fair estimate may be formed of his acquaintance with Latin by an examination upon a standard author.

Which did you think the most satisfactory of the two?—I could not exactly say; it depends very much on the way it is gone about.

With reference to ascertaining a candidate's knowledge upon Medical subjects, do you prefer, first, a previous examination to ascertain his knowledge of Latin, and then a subsequent examination in English upon Medical subjects?—Yes. I prefer the English examination decidedly, after a previous examination in the Latin language.

Is there any examination by the College of Physicians of Edinburgh, before admitting Fellows?—No.

Upon what footing are Fellows admitted by them?—Whoever has a Doctor's degree is admitted as a Licentiate, upon paying the fees, and is afterwards admitted as a Fellow, by ballot.

Upon what principle do you recommend the study of Greek, as a part of preliminary education?—Partly as a branch of the liberal education of a gentleman, which I think every Medical man ought to aspire to, to whatever class he belongs; and, besides that, a very large proportion of the terms in constant use are of Greek derivation.

Are not many of them used in a different sense from that in which the Greek words, from which they were originally derived, were used?—Many of them have changed their meaning; but still it is, perhaps, not the less necessary to know what the primary meaning was.

Do you think it absolutely necessary to study Hippocrates, and other Greek writers in Medicine, in the Greek language?—The information to be derived from Hippocrates may be gained without studying Greek, by means of translations.

You have stated you derived advantage, professionally, from having taken the degree of Master of Arts; do you think the advantage to be such, that you would recommend it to be a necessary qualification for every Graduate in Medicine?—I would not be disposed to make it imperative, that they should be Masters of Arts, for the reasons I formerly mentioned: there are a great many difficulties.

Would you be disposed to make it imperative that a candidate should have the same general knowledge as would be required of a Master of Arts?—It would be exceedingly desirable; but I would certainly keep in view the difficulties I have formerly alluded to, in regard to making it necessarily an Academical course, so as not to raise the qualifications unnecessarily high, and thus to exclude a considerable number.

You were an Examinator in the College of Surgeons some years?—Yes.

Had you many from England examined there?—Yes.

Will you have the goodness to mention whether you found, in general, the candidates from England, or those from Scotland, better prepared in the Classics?—I am not prepared to say.

How did you find them, in point of Medical knowledge?—I am not prepared to point out any particular difference.

Had those who took their Diplomas from the College of Surgeons, and who came from England, followed the greater part, if not the whole, of their Medical studies at this University, or at private lectures in Medical Schools?—The College receive tickets from private lecturers, who are Fellows of the College here, or of the College in London.

Was a small portion of their Medical information obtained, according to the opinion you have already expressed, during their apprenticeship with Apothecaries, if they served such?—Yes; but I think the important information they derived in England was from their attendance upon the London classes.

With reference to that regulation, in regard to the Apothecaries in England, is there any suggestion you would offer by which that difficulty could be overcome?—I do not know, except by withdrawing the monopoly, and throwing the profession open to well-qualified persons who have studied in other places.

Might not that object be obtained by some mode of examination for licensing of Apothecaries, instead of apprenticeship, so as to secure a certain portion of Medical information, in addition to the knowledge acquired in druggists' shops, which you think may be obtained in a shorter space of time than five years?—Yes; but I think the desirable thing would be, if it were thrown open to well-educated persons from Scotland and Ireland, settling as Apothecaries in England, with the requisite diplomas.

You would have no apprehension, in such a case, from ignorant people commencing Apothecaries?—We might prevent that, by making the Diploma of Surgeon, or the Doctor's degree, requisite from London, Edinburgh, Dublin, or Glasgow.

Would you wish to see Surgeons act as Apothecaries in England, to destroy the monopoly?—I would wish to see a person who has the Diploma of Surgeon from London, Edinburgh, Glasgow, and Dublin, allowed to settle as an Apothecary in England.

In such a case, do you consider that the person so settling would be better qualified for the profession of Apothecary, and that sort of practice which is connected with the trade of an Apothecary in England, than those who are solely educated by means of apprenticeship?—I think it highly probable.

Is it not very common for a man to practise as an Apothecary and Surgeon, and, in point

University of Edinburgh.

Dr. J. Abercrombie.

10 November 1826.

of fact, to do all the duties of a medical attendant?—Yes, he does all the duties of a medical attendant.

Is it not the consequence of that system, that a great number of persons get into practice, who, though not totally unprovided with previous Medical education, have one that is very imperfect?—At present, no person can practise as an Apothecary in England, who has not gone through a regular course of five years' apprenticeship, and, I think, one course of the London classes,—but I forget precisely.

In your opinion, is that a sufficient course of Medical knowledge to qualify a man to practise?—No, I do not think it is a sufficient course; that is to say, it does not ensure a sufficient course. I do not mean to say, there are not individual Apothecaries who may take a great deal of pains with their pupils; but the system is one which does not ensure a sufficient course of medical knowledge.

Do Surgeons in England never furnish their own patients with Medicine themselves?—I do not know that they do; I believe, if they did, the Charter of the Apothecaries' Company would interfere with them.

Do you consider it of consequence, that every Physician should be able to write his own language, in such a manner as to prove that he belongs to a learned profession?—Unquestionably.

Have you observed many instances of Medical Treatises well written by persons who, you had reason to believe, had no classical education?—No; I am not aware of any particular work.

Do you think it likely to happen, that a man would write equally well, who had not, as one who had, a classical education?—I think it is not likely.

Do you think that Medical Works, in general, are written in a better style now than formerly, or were there more instances of well-written works upon such subjects fifty years ago than now?—Yes, but it is difficult to say, for much more is written in Medicine now than there was at that time.

Do you find works upon such subjects are written perspicuously and elegantly, or as if they were very hastily put together?—There is a considerable variety in that respect.

What is your general impression?—I am not exactly prepared to give a decided opinion upon it.

In regard to additional attendance upon Anatomical classes, would you wish such additional attendance to be had in the University, or would you allow attendance upon private lectures?—There are certain cases in which there might be some advantage in making it optional: with regard, for instance, to the study of Practical Anatomy, if it were made imperative that it should be studied in the University, there might be difficulty in supplying the whole number with bodies.

But, generally speaking, where you think the classes should be attended twice, would you prefer attendance in the University, or would you allow an attendance upon private lectures?—Upon general principles, I do not know that there ought to be any particular advantage; I am not prepared to give a decided opinion.

Edinburgh, Saturday, 11th November, 1826.

The Right Honourable LORD BINNING in the Chair.

Dr. *William Cullen,* Fellow of the Royal College of Surgeons, Edinburgh, called in and examined.

Dr. W. Cullen.

11 November 1826.

Are you an established Practitioner and Lecturer in Edinburgh?—I am.

Are you a Graduate of this University?—I am.

Did you spend a considerable part of your time, during the period of your studies, at Paris?—Yes; partly before, and partly after graduation here.

The Commissioners are desirous of hearing any suggestions you have to offer upon the subject of Medical Education here, founded upon the opportunities you have had of comparing the system followed at Paris, with that followed at this University?—I have to express to the Commissioners, that I feel considerable reluctance to enter upon the subject, because I do not think that a person of my age or experience is qualified, or has any right to go into a general detail; but if the Commission request any information upon particular points, I should be very happy, and better pleased, to answer in that way.

Will Dr. Cullen have the goodness to state, what previous education is required at Paris, from persons intended for the Medical Profession?—I have to inform the Commissioners, that the course of study at Paris has been considerably altered within the last four years, in consequence of the turbulent behaviour of the students at the School of Medicine; and since that time, certain changes have been made in the preparatory qualifications. Students are now required, before they can be received as candidates for the degree of Doctor of Medicine, to have a certificate from some University, showing that they have entered certain classes of Philosophy and Science, or that they have the degree of Bachelier ès Lettres. That degree is necessary, before they can be received as candidates for the degree of Doctor of Medicine, and attend the lectures of the Faculty of Medicine.

Does Dr. Cullen know what attendance is necessary for obtaining the degree to which he has adverted?—I cannot speak positively; I have a general impression upon the subject, but I can give no distinct information.

Are there not means furnished, in every department almost in France, of taking such degrees at some public institution?—Formerly, there were numerous Colleges in France that granted degrees, in some of which studies were actually pursued, and in others, there were no courses

393

University of Edinburgh.

Dr. W. Cullen.

11 November 1826.

of lectures given. I believe the only places now where degrees such as I speak of are granted, are at Strasburgh, Montpelier, and Paris.

Do you know what Literary and Philosophical Classes are necessary for them to attend?—If they are to be Bachelier ès Lettres, they must have attended Greek and Latin, and a Class of Philosophy, and a Class of Rhetoric.

By a class of Philosophy, do you mean Moral Philosophy, or Logic?—Yes; Moral Philosophy, or Logic, I am not sure which; the title is that of Philosophy. I rather think it is a combination of the two.

Is Mathematics required?—I think that falls under the head of Education for the degree of Bachelier ès Sciences.

What other classes, besides Mathematics, are they obliged to attend for that degree in Sciences?—I really do not recollect.

When did these new regulations you speak of take place?—In 1823.

Are you able to say what the system was before that time, with respect to previous education?—There was no previous education at all; it was necessary for every student to produce a certificate of the place of his birth or parentage, and nothing more; and if he were a foreigner, it was necessary he should produce his passport, or Permis de Séjour.

What regulation is there in the University of Paris, with respect to previous education, for the admission of foreigners to the degree of Medicine?—I do not know in the least how it applies to them. I think at that time foreigners were placed under the same regulations as natives, and they too were desired to have the degrees.

Would equivalent degrees from Dublin, or Oxford, or Cambridge, be considered sufficient?—I make no doubt of it, upon the general principle that degrees from any University in this country, for Medicine, for instance, were accepted as complete as those from the Faculty of Paris.

Was this new regulation much complained of by the students at Paris?—It was.

Did it diminish the number?—I cannot speak to that. I presume not.

Is the Literary and Scientific character of Physicians very high in France at present?—Very much the reverse.

Do you understand that the object of that recent regulation was, to secure that the graduates in Medicine should be of older standing; or had the change reference to the interests of Medical Science; or was it an interference of the Police?—It struck me it was more a regulation of the Police, than a measure proceeding from any wish to improve the general character of the Medical Profession; that might have been the occasion of it in a secondary way.

Do you know whether there were any Literary or Scientific Examinations previously?—None whatever; and, accordingly, any person could come up from the Provinces, and study Medicine at Paris, upon scanty and limited means. The consequence was, that many persons (such as those who are in this country at the plough-tail) were students of Physic, and if they had abilities, they were advanced, in a regular course of preferment, to the first places in the Faculty. In consequence of that facility, men came up to Paris with no particular connexions—no responsibility—no particular motives for good behaviour; and the School of Medicine had uniformly distinguished itself by its turbulence, or seditious spirit, as it was called in the language of the day.

Do you consider, then, that it was rather of the nature of a political regulation?—Quite political: the whole alteration in the Faculty of Medicine depended upon the behaviour of the students. Upon one particular occasion, when an inspector of the University, who, I believe, was a priest, came among them, there was a very riotous scene took place, and the whole of the students adjourned out to the square in front of the School of Medicine, and began to shout, *Vive la liberté!* and other cries, which were thought seditious. Immediately the Faculty of Medicine was abolished, and the students were permitted, upon proper representation being made to the Dean of the Faculty, to go, some of them to Montpelier and Strasburgh, that they might not lose their inscriptions. The whole of the students were compelled to leave Paris.

Was this done by an *Ordonnance du Roi?*—By an *Ordonnance du Roi.*

Do these regulations apply only to the University of Paris, or are they extended to Montpelier and Strasburgh?—To that of Paris. I must not speak of the *University* of Paris; it is a general word, and comprehends a great variety of Faculties in relation to Medicine. We must only talk of the Faculty of Medicine: it corresponds entirely to the Medical Faculty in this place; it is a distinct and separate Faculty, and forms a component part of the University, and is subject completely to the Grand Master of the University.

Have these regulations tended to improve the character of the students?—I have not heard any complaints since; I do not know whether they will or not.

With respect to the system of Medical Education, at the Faculty of Medicine at Paris, have you any information you can give to the Commissioners on that subject?—The Faculty of Medicine at Paris is much more complicated than the Faculty of Medicine here; it consists of twenty-three Professors, teaching distinct branches of Medical Education. To two of the Chairs, however, there are two Professors attached; there is the Chair of Practical Medicine, and the Chair of Practical Surgery—the one denominated Pathologie Interne, and the other Pathologie Externe.

Is Practical Surgery so called?—No: the Surgery that is taught in the School, consisting of the theory of Surgery, the history of surgical complaints, the symptoms, and the general treatment and prognostics, is denominated Pathologie Externe. Medicine, or the history of those diseases which fall completely under the care of the physician, in the same way is denominated Pathologie Interne.

University of Edinburgh.

Dr. W. Cullen.

11 November 1826.

Are the subjects all allotted to the different Professors, or are they allowed, as in some of the German Universities, each to choose the subject that best suits his own peculiar views and studies?—Each Professor is Professor in his own department, and that only by his Commission.

How are they appointed?—There are different orders of Professors in the present Faculty of Medicine; formerly, they were appointed by Concours, that is, by a public trial and exhibition of skill before Examinators; and he who had a majority of votes of these Examinators, was appointed Professor. Now, there are twenty-three Professors Titulaires, as they are called; there are twenty-four Professors Agrégés, and twelve Professors Stagiaires. The Professors Titular alone teach in the Faculty; the Professors Agrégés are their substitutes; and if any of the Professors Titular are indisposed, or absent upon indispensable business, his place may be supplied by any of the Professors Agrégés. Those Professors Agrégés have no emoluments of any kind, and no share of teaching within the Faculty, except when called upon as substitutes for any of the Professors Titular; and when they have acted during a certain time, they have a certain share in the emoluments. The emoluments of the Professors Titular are derived from two sources—a fixed salary, and what is termed the droit de présence. That consists of money obtained from the inscription of the students, and money paid for examination for degrees; the Professor gets a certain sum every time he examines, and while he is performing certain functions; if he is absent, his place is supplied by a Professor Agrégé, and that Professor derives half of the droit de présence, which should have fallen to the Professor Titular, during the time the Professor Agrégé acts for him: that is the only emolument the former have. The Professors Stagiaires are an inferior class of Professors; they have no salary; they have no emoluments; they cannot act as substitutes for the Professors Titular; but it is an advantage to be a Professor Stagiaire, for he necessarily passes to be a Professor Agrégé. The number of these latter Professors Agrégés is twenty-four, but every year there is a change; they are Professors Agrégés only six years, and after serving for that time they become Professors Agrégés Libres; they have no particular duty to perform, and their only privilege is that of being permitted to give private courses. Private lecturing was formerly quite unlimited in the Parisian school; any person might lecture. That is now entirely done away with, and no one may give a private course of lectures except the Professors, either Agrégés or Stagiaires; but those who have been Professors Stagiaires for three years become Professors Agrégés; and after being six years Professors Agrégés, they become Professors Agrégés Libres, with the same privilege of lecturing. It is from these Professors Agrégés and Libres, that the Professors Titular must be appointed. The first appointment of the twenty-three Professors was by a Royal Ordonnance; but in future they are to be appointed from the Professors Agrégés in the following way: out of the Professors Agrégés three candidates are to be chosen by the Faculty, and three by the Conseil de l'Instruction Publique; from these lists, so presented, the Grand Master of the University must appoint one; the choice of the individual depends upon the Grand Master alone.

Has the Grand Master of the University authority over all the Faculties, and is he appointed by the Crown?—Yes, and he is appointed by a Royal Ordonnance.

Is he a professional person?—There has been only one Grand Master appointed; it is a new office, that has been created in place of the ancient Président du Conseil de l'Instruction; it is now an Abbé who fills that office—I do not know his name; he who was Grand Master some time ago, is now Ministre de la Feuille des Bénéfices; a new office was created for him, but I do not know how.

In regard to the system of instruction which is pursued by these Professors, for what period do their courses last, and upon what plan is their system of teaching conducted?—Of the courses, some are given during winter, and some during summer; they are so arranged as not to interfere with each other at all. They are some of them regulated by spaces of six months. The Semestre d'Hiver commences the 1st of November, and lasts till the 31st of March; the Semestre d'Eté begins the 1st of April, and lasts to the 31st of July. I believe, at present, in none of the courses of Medicine are the lectures delivered every day, but a certain number of days in the week; but their lectures last now from an hour and a-half to two hours.

Is there any examination in their classes?—There are examinations in some of the Clinical classes, particularly the Clinical class of Surgery; when I was in the practice of attending it, there were no examinations in any of the other classes.

Were examinations conducted by the Professors, or any of those Subsidiaries?—By the Professor in the Clinical-Surgical class. The Anatomical class now meets only three times a-week; the other classes generally, upon the present organization, three times a-week; but that is subject to constant variation. According to the resolution of the Faculty itself, declared a certain time before the commencement of the session, it is not invariable. In one year any of the classes may meet three times a-week; and, by an order of the Faculty, they may meet five times a-week the year following.

Are the lectures delivered by those Professors who have the privilege of giving lectures, within the walls of the College, or the Institution—or are they entirely private lectures?—All of them are entirely private, not in the least under the control of the Faculty, with regard to the management of them; but in places within the Faculty they are given in a certain dependence upon the School of Medicine, denominated Hospice de Perfectionnement, where there are a number of amphitheatres allotted to the Professors Agrégés.

Will you have the goodness to state the different Professorships?—The twenty-three Professors are as follow:—There is one of Anatomy, one of Physiology, one of Medical Chemistry, one of Physique Médicale—that is, Natural Philosophy applied to the explanation of the functions of the body and the production of disease; one of Natural History, so far as

395

University of Edinburgh.

Dr. W. Cullen.

11 November 1826.

it relates to Medicine, and another relating to the productions which are used in Medicine; then there is Pharmacologie, which treats of every thing that relates to the Practice of Pharmacy; there is another Hygiène, that is, what we denominate generally Dietetics, in this University, that is, the history of the influence of all those agents which act upon the body in health and disease; there is another of Medical Pathology, that corresponds to our Professor of Physic—there are two Professors attached to this Chair; there is a Professor of Pathologie Chirurgicale, and a Professor of Médecine Opératoire—that is, to display all the modes that have been proposed for the performance of different operations, to exhibit the application of dressings of bandages of various kinds; there is a Professor of Therapeutics and Materia Medica; there is a Chair of Medical Jurisprudence, and one of Midwifery; there are four Professors of Clinical Medicine, three of Clinical Surgery, and one Professor of Clinical Midwifery; besides, there are very extensive arrangements for the prosecution of Practical Anatomy.

Is there no separate Professorship of Practical Anatomy from Anatomy?—There is no Professorship, but it is under the superintendence of a particular person, denominated Chef des Travaux Anatomiques. There are only two places in Paris where dissections are permitted for students in general; one is at the École de Médecine; the other, at the Hôpital de la Pitié; besides these, dissections are carried on to a greater or less extent, in all the Hospitals, by the pupils, that is to say, by the dressers, by the Elèves Externes et Internes.

In regard to Medical Chemistry, would you say that there is any department, that is not comprehended in our Chairs of Chemistry and Materia Medica; or that those different Chairs, in the French University, embrace more than is comprehended under the arrangement in the Scotch Universities?—Chimie Médicale was taught by a distinguished person of the name of Vauquelin, and he embraced in his course what the Professor of Chemistry in this University denominates Pharmacy, that is, the Chemical composition of all the drugs and substances employed in Medicine; and besides, it was a sort of general course of Chemistry, but not very extensive.

Do you conceive that the science of Chemistry was carried to such an extent in study there, as it is here?—Not in that particular class; it did not embrace the whole subject of Chemistry. Chemistry, as a branch of general science, was taught elsewhere, in the College de France. It was Chemistry, more particularly applied to Medicine, that was taught within the Faculty.

You have been asked as to two or three of these Chairs; but taking a view of the whole number of Professorships, are there any embracing matters which are not taught (though in a different form) in this University?—The classes were really very different from what they are here; for instance, in Anatomy, the whole subject of Anatomy was not treated of in the course of one year; the Professor did not finish a complete course of Anatomy under three years—he lectured five times a-week. Besides this, the general students of Medicine attend two other places, the Pavillons de l'Ecole de Médecine, and the Hôpital de la Pitié; but besides, there are very large Hospitals in Paris, which employ a great number of young men, as Dressers, House-Surgeons, or, as they are denominated, Élèves Externes et Internes. As there are many Hospitals at a distance, and the pupils cannot come either to the Faculty of Medicine, or to the Hôpital de la Pitié, for Practical Anatomy, they are allowed to dissect in the amphitheatre, which is connected with every hospital; but the general pupils of the Medical Schools do not dissect in these hospitals, which are to be considered as private opportunities.

As there are two places where they can dissect regularly, are the arrangements there very extensive?—Very. Indeed, there is always an abundant supply of dead bodies. The dead bodies of those who die in the hospitals at Paris, if not claimed by their friends, are given for dissection. After being dissected, the remains were carefully gathered up, and interred in the usual way.

Are many of the bodies claimed by friends?—Very few indeed.

What do you suppose is the average number of bodies employed in the course of a year at those two places, for dissection, connected with the Faculty of Medicine?—It is impossible to say; there are from about 800 to 1000 students constantly at work, and dead bodies never fail them; they are to be bought at the rate of ten francs at least a-piece, in the School of Medicine, and five francs at the Hôpital de la Pitié.

With regard to that class of Natural Philosophy which applies to the subject of certain diseases and certain parts of the structure of the human body, does it not seem to be a class to which there is nothing analogous in this University?—There is nothing here analogous to the Physique Médicale, or to Histoire Naturelle Médicale.

Did you attend either of these two classes?—I did not.

Had you opportunities of judging of the utility of the classes?—Yes; I had an opportunity of judging of their utility by having read the text-book of one of them, the Physique Médicale; it seems to me to be a very excellent class, and a sort of accomplishment to the Medical character.

Is anything taught in the two Chairs of Physique Médicale et Histoire Naturelle Médicale, which is not taught by the two Professors of Natural Philosophy and Natural History in this University?—I have every reason to believe that no part of the subject of either of these Chairs is considered, either by the Professor of Natural Philosophy, or by the Professor of Natural History. I attended, last summer, the course of the Professor of Natural Philosophy in this University, in which he expressly stated he should consider the subject as in some respects applicable to Medicine. I take it for granted he does not do so in his winter course, which is the proper object of his profession.

Was that summer course of his at all analogous to the class of Physique Médicale?—

University of Edinburgh.

Dr. W. Cullen.

11 November 1826.

Somewhat; but it was an experimental class, not for Medical men only, but for general students also.

Do you think that a class, analogous to that of Physique Médicale, could be taught by any gentleman who is not a Medical man?—I do not think so; but it would require to be taught by a Physician, who had devoted himself in a secondary manner to Natural History and Natural Philosophy. A certain degree of medical knowledge is necessary for it.

Are the Commissioners to understand there is no Professor in this University who treats of these matters, that are properly embraced by the two Professors you have already alluded to?—No; there is no Professor in this University who embraces the subjects contained under the Histoire Naturelle Médicale, and Physique Médicale, as far as I believe. I have attended Natural History here, and it certainly is not embraced by Professor Jameson.

Do you consider those classes as embracing material subjects of study, preparatory to the degree of Doctor?—I do not consider them of any very great importance.

Is there any order laid down for the attendance on the classes, at this Institution?—Yes.

Will you have the goodness to state what that order is?—The students must attend the Faculty of Medicine for four years; and during those four years they take inscriptions, as they are called. They do not enter themselves with any particular Professor and pay him a fee; they take inscriptions at the Secrétairiat of the Faculty. They pay each a particular sum; the product of these inscriptions is divided equally among all the Professors, and no particular fee is charged for any one class. The inscriptions are taken every three months: there are four inscriptions each year. The fifteen inscriptions of the three first years cost fifty francs a-piece; that is to say, the student pays 750 francs, or £30, the three first years he attends the Faculty; and for that sum he may attend, if he pleases, at the extra hours, all the lectures given on all the subjects by the different Professors. For the sixteenth and last inscription he pays 35 francs. They attend four years, and go through the whole of the classes I have mentioned, in the following order:—During the first year they attend, in the winter, Anatomy, Physiology, Chimie Médicale; during the summer they attend Physique Médicale, Pathologie Externe, or General Surgery, and Botany. During the second year they attend, in the winter, Anatomy and Physiology a second time, and Médecine Opératoire. I should, perhaps, have mentioned, that though certainly the great majority of the subjects treated of in the Medical Faculty of Paris fall also under the notice of our Professors, yet, on account of the subdivision of labour, the subjects are treated in the Medical Faculty at much greater length. Our Professor of Anatomy embraces Anatomy, Pathology, Surgery, and Morbid Anatomy. In Paris the Professor confines himself strictly to Anatomy. The Theory of Physic here embraces Physiology, Therapeutics, and General Pathology. In Paris there is a Professor of Physiology, or the account of the functions of the body, equivalent to the Anatomy, in which the structure is described; and consequently, the course of Physiology in the Medical Faculty at Paris is of nearly three times the extent that it is here, and the subject is extensive enough to employ a Professor during the whole of the Sémestre d'Hiver. The summer of the second year they attend the Medicine, Pharmacy, Pathologie Externe, a second time, and Clinique Externe, that is, the Surgical Practice of an Hospital. The third year, in the winter, they attend Clinique Externe, Médecine Opératoire. In the summer they attend Pathologie Interne, Clinique Interne, Matière Médicale. In the fourth year they attend the Clinique Interne; in the summer they attend the Pathologie Interne, Medical Jurisprudence, and the Hospice de Perfectionnement; that is a particular Hospital, in which curious and rare cases are received; but that is not included in the list of the Professors. Midwifery is attended in the summer of the last year.

Are all these classes part of the Curriculum, or of the course which it is necessary to attend for Graduation?—It is the course attended for Graduation, and precisely in the order which I have mentioned to the Commissioners.

How do they manage with students that come from abroad, in regard to the course and order of study?—If that student is to take the degree of Doctor of Medicine, he must attend exactly the same as the native students. If he have attended some classes in this or in any other University before, for instance, Anatomy, they will dispense with his attendance upon the same classes in Paris, taking an examination for his degree expressly upon the same terms as if he had attended at Paris; but he pays the inscriptions precisely as the other students.

Must he attend the whole four years?—He must attend the whole four years.

What if he attended at other Universities?—I happened to know that; for at one time I thought of taking my degree at Paris. They told me that I must attend those classes, of which I had not attended the equivalent elsewhere; and I must attend a certain length of time, and pay my inscriptions, as if I had attended for the whole four years. I needed not actually have attended for the whole four years. I attended all the classes that were last to be taken, but only Anatomy.

But may a shorter period of attendance than those four years suffice?—I believe not. I recollect it was explained to me, that if I only attended three winters at this University, they would require me to attend the fourth there, to make it up.

Did they require four years, besides attendance here?—No.

Then the three years' attendance here was admitted?—At the end of the fourth year I might have been received upon trials.

Would they take one of the classes here as equivalent to two classes at Paris, in consequence of the subdivision, which does not take place here?—Yes: they would take the Theory of Physic at this University, probably in the place of Therapeutics and Physiology.

Do you consider the number of classes there as oppressive to the students?—No, certainly not; the expense of attending them all is exceedingly moderate.

But do you consider it oppressive in point of time?—No.

Does it not tend to perplex their minds?—No; and not only that, but a great many of

397

University of Edinburgh.

Dr. W. Cullen.

11 November 1826.

them, independent of the classes of the Faculty, attend private lecturers, when they are of celebrity.

Do you consider any of these classes, as they are conducted, are superfluous?—Certainly none of them are too much; how far it might be worth while to adopt them is another question.

Do you think that this division of the whole subject of Medical Science into such a great variety of different Professorships is advantageous upon the whole?—Highly advantageous; and not oppressive, because it is not attended with a corresponding increased expense.

Is the science of Comparative Anatomy taught separately, or by some of the Professors you have mentioned?—It is not taught in the Faculty of Medicine.

Is it taught under the class of Natural History?—I presume a certain portion of it.

Is it taught entirely in the other Faculty?—It is taught entirely in the Faculté des Sciences, and at the Garden of Plants.

As the number of medical gentlemen at Paris capable of being lecturers is so great, is there but little difficulty in finding fit persons to fill these chairs?—Not the slightest.

Is it attendance at Foreign Universities only that is received at Paris as an equivalent, or is attendance at Foreign Medical Schools of eminence (which are not Universities) received?—Such a case never having presented itself to me, I cannot say; but attendance at the classes of this University I know did qualify. I do not know what may be the temper of the present Faculty.

As there is an excellent School at Geneva, do you know if the Swiss students from thence are admitted at Paris?—I hear of it now for the first time.

Would a young man, who had attended the hospitals in London, and attended lectures given by the members of the Royal College of Physicians and the Royal College of Surgeons in London, be admitted at Paris, the same as if he had been at a University?—Formerly there would have been the greatest disposition, on the part of the Faculty of Medicine, to pay proper respect to the tickets of the very eminent men who are in London, and who are personally known to many of the members of the Faculty; but I doubt if they would have been received, in consequence of not coming from a Medical Faculty.

With regard to the manner in which Clinical Medicine is taught, could you favour the Commissioners with any information upon that subject?—There are four Professors under the control and sanction of the Faculty; and besides, the Administration of the Hospitals has it in its power to cause Clinical lectures to be given on any subject that may seem to deserve it; and accordingly, Clinical lectures are given, more or less, at all the Hospitals at Paris. Some of them are given by Professors of the Faculty, and others depend upon the administration of the Hospital: there are four Professors of Clinical Medicine belonging to the Faculty; there are three Clinical Professors of Surgery, and one of Clinical Midwifery.

Is there an Hospital attached to the Faculty of Medicine, to which these four Professors are appropriated, or are they appropriated to the different Hospitals, by an arrangement with the Administration of the Hospitals?—There is one Hospital that is especially under the control of the Faculty, and in connexion with it; it is the Hospice de Perfectionnement. It is a Surgical establishment; it comprehends the treatment of all remarkable and very rare cases, which are sent there, to be under the observation of the more advanced students. The other Clinical Professors lecture in the Hôtel Dieu, and at La Charité, by an arrangement with the Administration of the Hospitals. I may mention, that the Professors of Clinical Medicine are on a different footing from all other Professors; none of the other Professors can be chosen but from the Professors Agrégés, and they must have become so from having been Professors Stagiaires; and these latter Professors are appointed by Concours, that is, by a comparative trial. But, without having recourse to Concours, the Grand Master of the University may appoint ten Professors Agrégés without Concours, who must be distinguished Practitioners in Physic, and aged at least 40; and the number of these cannot exceed ten, and from these ten may be chosen the four Professors of Clinical Medicine.

Are these ten in addition to the Professors Titulaires?—These ten are Professors Agrégés, in addition to those who have been appointed in consequence of Concours. I believe they are Agrégés Libres, and not Agrégés en Exercice, as the twenty-four are.

Was that arrangement dictated by the desire of obtaining eminent Practitioners to be Professors of Clinical Medicine?—Yes; for it is manifest that, but for that arrangement, very young men might be Professors of Clinical Medicine. No one can be a Professor Agrégé unless he is twenty-five years old; but he may at that age become one. Nothing can prevent him, when he is Professor Agrégé, from being a substitute of the Professor de Clinique, which would be a very great abuse.

With reference to the course of instruction pursued at the Faculty of Medicine at Paris, would you say, upon the whole, that there is a more complete and more useful course of instruction conveyed to the students, by means of their lectures, than can be acquired at this University?—Their course of instruction is certainly much superior to the Medical education here; the courses are much more numerous, and the subjects are treated more in detail. But the Professors have no particular motive for exertion: if a Professor is attended by ten students, his emoluments are as great as if the theatre were crowded; consequently, many of the courses are very imperfect; they are so imperfect that it is on that account the private lecturers have such numerous classes.

Is that owing to the circumstance, that there is no inducement for exertion on the part of the Professors?—Yes; but supposing the particular part of the arrangement, which seems defective, were remedied, then there could not be a doubt that the course in the Faculty of Medicine at Paris is considerably superior to that of this University. The *theory* of teaching is superior, independent of the great opportunities for practical instruction, which we never can have here.

Would you say that some of the defects in the theory of teaching in this University might

University of Edinburgh.

Dr. W. Cullen.

11 November 1826.

be remedied by a division of some of the Chairs, or by an addition of other Chairs; or is there any method by which you could combine the advantages of the mode of teaching in Paris, with the system of instruction pursued in this University?—I apprehend, for instance, the Professor of Anatomy should lecture upon Anatomy alone. The subject is so extensive, as I know by experience, that a six months' course of lectures, sticking closely to the subject, is not sufficient to embrace it in all its details.

You are yourself a lecturer upon Anatomy?—I am.

Are there any other classes which you think are overburdened by the extent of the subject?—The class of the Theory of Physic embraces, at present, Physiology, Pathology, and Therapeutics; either of these subjects is sufficient for a six months' course of lectures, except Therapeutics, and that would be well deserving of a three months' course of lectures.

Do all three of them form a subject of three separate courses at Paris?—They do.

Do you think there is any advantage in the distinction which is made in the Institution at Paris, between Chimie Médicale and Pharmacologie?—Pharmacologie is the art of compounding and preparing Medicines for exhibition in the body of the patient, giving them in the form of prescriptions and recipes. Chimie Médicale is the Chemical Analysis of the substances of which they are composed.

Might not those two subjects be taught in one class?—Very likely.

Does it appear to you that there would be any disadvantage arising from the teaching of Chemistry, especially with reference to the science of Medicine, leaving it to be pursued in other classes as a branch of general science; or do you consider that the general Chair of Chemistry should embrace what is included in the class of Chimie Médicale?—General Chemistry is quite sufficient for one Professor, without Chemical Pharmacy.

Is there any course of Practical Chemistry in the Chairs of Paris?—No, none by order of the Faculty; but there is, under the Professor of Chemistry, as in this University, a Préparateur; and that Préparateur, in his laboratory, gives a course of Practical Chemistry, just as Anatomists give a course of Practical Anatomy. Those courses have been very extensively followed by the students.

Do you consider the lectures given by the Assistant of Dr. Hope, in this University, to be materially useful?—Certainly. But as far as I understand, they are not lectures, but merely demonstrations. I consider them as highly useful. It is only by such a course that a student can obtain that practical acquaintance with Chemistry which is of advantage to him.

Did you attend the class of Medical Jurisprudence at Paris?—I did.

Have you ever attended that class at this University?—I have not. But I have reason to believe that it is exceedingly well taught here, as it is indeed at Paris.

Do you think that it would be an improvement of the system here, that attendance upon that class should be rendered imperative upon candidates for Graduation?—It is a very difficult question to answer. It is undoubtedly the case, that in a great majority of the instances where Medico-legal investigations are carried on, medical men, who have not paid particular attention to that subject, are very apt to go wrong; and they do go so far wrong, for they are constantly contradicting each other in their examinations, and medical evidence before juries is generally thought very unsatisfactory. It may happen that a medical man may be called upon to give evidence, and he may give answers which are quite unsatisfactory, because he has not paid particular attention to that point.

Is attendance upon that class imperative at Paris?—Yes.

Did you happen to be present at any criminal trials, or investigations at Paris, where you heard any medical evidence?—I have not; but I have perused very full reports of such trials, and, in Paris at least, they are conducted in a very superior manner. Those investigations are entrusted, by the Prefect of Police, to persons fully qualified to pursue them, who have made the subject their previous study. In a case of poisoning, for instance, the Professor of Medical Jurisprudence would be called upon, with the assistance of a committee, to give in a report; and accordingly, upon trials where such evidence is given, and they are called upon to investigate the matter, there is very little or no difference of opinion. Difference of opinion only takes place when there is ignorance on the part of some of those who make the investigation. If, upon a legal examination, such men as Dr. Duncan, junior, Dr. Christison, and the Professor at Paris, were called upon to give evidence, there would be no difference of opinion. In relation, for instance, to poisoning, or cases of suspended animation, and questions upon the appearances presented in dead bodies, whether they are the natural result of disease, or of some substance previously administered,—if any of the common description of country practitioners are called in, there will be the most various conflict of opinion, and the jury must necessarily be puzzled, for they cannot attach more importance to the opinion of one practitioner than another.

Is the difficulty, which you seem to entertain in regard to making attendance upon the class of Medical Jurisprudence imperative, a difficulty connected with the nature of the subject, or with the arrangement pointed out in the *Statuta Solennia* in regard to the attendance upon other classes?—If there are new arrangements to be made, I presume that those classes should be made imperative which are of the most importance. It will occur in many instances, that perhaps only once or twice, in the course of a long life, a Medical man will be called upon to give an opinion in a case of that kind. With reference to Medical studies, I must say I think it is a point of comparatively little importance; it may sometimes be of the highest importance, but *in the general run* I have an opinion that it is not so much so.

What period of vacation is there, in the Medical School at Paris, in the course of a year?—Three months, from the last day of July to the first of November.

Is the attendance, during the three months of summer, as great as during the winter course—Very nearly as great.

Is it by attending two sets of lectures, one after another, in the course of a year, that they are enabled to overtake such a number of subjects?—Certainly.

Can you give the Commissioners any information as to the mode of Examination for degrees in Paris?—That is one of the points, which I conceive would require alteration in this University. One examination, and in Latin, never can be sufficient. In one examination of an hour, a student cannot be examined minutely upon any subject, still less upon the great variety which it ought to embrace. It is a very general impression, and I have the distinct conviction, that the examination by the Medical Faculty here is comparatively light. In Paris, they undergo five examinations before a deputation of the Faculty. Three Professors examine at once; these examinations are public, and they last from an hour to an hour and a half; they are enabled, however, easily to overtake so much business, in consequence of examining three students at once, sometimes more.

Are the Examinators the Professors Titulaires?—Yes; the Professors Agrégés may supply their place. At the first, the student is examined upon Anatomy and Physiology alone, a certain number of minutes; he then passes to the second Professor, and so on to the third; and thus the three examine him.

Is that first examination at the conclusion of the first course of study, or the first Semestre?—I believe they may take their examinations at any period of their studies they please, or as soon as they have attended the proper classes; it is not necessary that they should wait till the end of the fourth year before they pass examination.

Will you have the goodness to state how the second examination is conducted?—In the second examination, they are examined upon Medicine and Surgery, in the same way as at the first; in the third, they are examined upon Chemistry, Botany, and Pharmacology, and particularly upon the art of writing Prescriptions; in the fourth, they are examined upon Medical Jurisprudence and Materia Medica; in the fifth, upon Clinical Medicine and Surgery, that is, the management of particular cases. Then they have, besides, to publish a Thesis; and in the sixth examination, they have to defend that Thesis, which may be written either in French or in Latin, but it is always written in French.

Are the examinations conducted in Latin or French?—In French.

Is the result of every successive examination recorded, so as to show whether the student has passed satisfactorily or not?—I presume so.

With reference to what you term the sixth examination, in which they defend their Thesis, is it a mere matter of form, or is it at all in the nature of a test?—It is a test of a student's attainments; but it is commonly a matter of form, as it is here, unless when the students have advanced new, or what are thought erroneous doctrines; if he defend the doctrines with ingenuity, he passes, whether they are right or wrong.

Have you witnessed those examinations?—Yes; they are always public, and attended by considerable numbers.

Did it appear to you to be a very searching test of the student's knowledge?—Undoubtedly; the questions put to them were the most minute that could be imagined.

Are any part of the examinations conducted by means of written questions being given to the students, which they are desired to solve at the time, without any assistance?—No.

Does it often occur that candidates are remitted to their studies upon any particular branch?—I cannot, from knowledge, speak to that point.

Do you know how many graduate in a year at the University of Paris?—I do not know.

In the previous course of education that is required, is a knowledge of Greek demanded?—Greek and Latin, I believe; Latin, certainly.

Has the number of students been increasing?—I never heard any complaint of the number diminishing; and such are the practical opportunities for instruction instituted at Paris, that, I believe, whatever system of instruction was pursued there, the number of students would be great; such is the reputation of Paris as a place of instruction all over the country. The Universities of Strasburgh and Montpelier have had very celebrated men, but have not exceeded a certain range; the degrees are held in much less estimation than those of Paris.

At what age can students receive the degree of Doctor of Medicine at Paris?—I am not aware that any age is mentioned.

Has the course of study, requisite for degrees, been increased considerably of late years?—Yes.

Do you know whether, since greater strictness has been introduced, it has had any effect in increasing or diminishing the number of graduates?—It is impossible to say; I believe the expense of graduation, which has a very great effect upon the number of graduates, is the same as it was before; and as there are more classes, and more Professors than were before, I should suppose that the number, as far as it depends upon the success of teaching, ought to be increased, rather than diminished.

Is it only the graduates, who are obliged to go through a four years' course which you have described; or must all who inscribe themselves go through that course, whether they intend to graduate or not?—There is a modification of Medical practitioners. If the course of education at this University were very extensive, and at the same time made proportionally expensive, it would require to be adopted, undoubtedly, with some qualifications. In Paris, there are Doctors of Medicine, and Officiers de Santé. The latter correspond to the Apothecaries in London, and in some respects to the Surgeons and Apothecaries in Edinburgh thirty years ago. They go through very nearly the same education as the Doctors, but they do not attend some of the classes twice; they attend the lectures of the Faculty only three years, and the price of obtaining the Diploma of an Officier de Santé is considerably less. They may become Officiers de Santé without attending the Faculties of any of the Universities, but by attending the secondary schools, which are situated in different large towns in France. These indivi-

Dr. W. Cullen.

11 November 1826.

duals are an exceedingly useful class of practitioners; they enter the Navy and Army, where the emoluments are not very high; they practise in the country towns, and in places where Doctors of Medicine could not settle, on account of the low scale of the emoluments. These individuals form a class completely distinct from Doctors of Medicine or Surgery.

Is there any particular order of attendance, or course of study, prescribed for those who do not intend to take either degree, but merely for students, such as yourself; or might they take any order they chose?—I might have taken any order I pleased, and that permission was obtained, upon application to the Dean, upon showing my passport and Diploma. The Diploma of Surgeon is shown, and, I believe, the permission to attend the lectures gratis, was granted. Students at that time were expected, however, to inscribe themselves, and to pay; but at the period I am speaking of, there was no calling over of names in the class, and no surveillance exerted as to who entered. The lectures were *pro bono publico*, to which all the world might go.

Was any certificate given in the University of Paris, showing the partial or negligent attendance of students at various classes?—Previous to 1822 there was none, and, accordingly, the attendance on many classes was exceedingly negligent. I have seen Professors lecturing to ten or twelve students; I have seen another lecturing to twelve hundred, in the same Amphitheatre. In 1822, the Administration insisted that the Appel Nominal should take place. They consulted their registers, and knew from thence, what number of students in the 1st, 2d, 3d, and 4th years, should be attending. A list was delivered to the Professor, and he was expected to call over the names, in no regular order, upon days unforeseen, so as to call every person twice or three times a-month; and the names of the absentees were marked, and they lost their inscriptions, if they did not go to the Dean of the Faculty, and give a valid and satisfactory reason for their absence.

Is there any particular period when students are required to attend Practical Anatomy?—There is no particular part of the Curriculum, when students are required to attend; that point is left to their own discretion.

Have you the means of getting any information as to the number of graduates at Paris for the last few years, so as to exhibit what effect the recent regulations have had, in increasing or diminishing the number of graduates?—If it were the desire of the Commissioners, I could write to some friends of mine, and endeavour to procure it. I do not know if it would be successful. I would just wish to inform the Commissioners as to the whole expense of attending the Medical Faculty four years. The students are permitted to attend, not by feeing individual Professors, but by taking inscriptions at the Secrétairiat of the Faculty. For the first 15 inscriptions, they pay 750 francs; for the 16th and last inscription they pay 35; and the whole five examinations cost them 150 francs; their sixth examination, in which they defend their Thesis, 65 francs; and the Diploma, 100 francs. The whole expense comes to 1,100 francs, or £44; for that sum they may attend the whole of the lectures of every kind, but that is exclusive of the expense of dissection. There is nothing paid for attending dissections, the price of the bodies only is paid. The 1,100 francs that each student pays in the course of his Curriculum, are divided equally among all the Professors.

Is any thing paid for the bodies which are given from the Hospitals?—Yes.

Is it paid to the Hospitals?—It is; at least a certain part goes to the fund of the Faculty, and a certain part to the Hospital.

Is the payment made by the individual student?—It is made by the student who dissects the body.

Are there any other suggestions besides what you have mentioned, in regard to the Chair of Anatomy and the Theory of Physic, which you would wish to make, grounded upon your observation of the Chairs at Paris?—Physiology, I think, might with great advantage be made a distinct Chair; the subject is quite extensive enough; but I would by no means say that it ought to be the case in this University. Independent of what is expedient in the Medical point of view, it is necessary to pay great attention to the expense that will be necessarily entailed on the students; and it should be tried, as much as possible, to unite, with what is expedient, what is practically possible and economical.

Do you think that there should be a Professorship of Surgery here, quite separated from the Anatomical Chair?—A Professorship of Surgery is absolutely indispensable.

Do you think that class ought to be taught by a Practical Surgeon?—Undoubtedly; it can only be taught by a practical man.

Have you any further observations to offer to the Commissioners?—There is a suggestion I had to make, with regard to Clinical Medicine. I conceive, from the way in which it is at present conducted, comparatively little advantage can be obtained by the students. I attended two courses of Clinical Medicine at this University, and I really profited very little by them, on account of the manner in which the visit was conducted; because no one can do more than look on.

Is that owing to the number of students, and the crowded state of the wards?—Not owing to that more than to the system, by which no one, however active and well disposed, could obtain much information. In the first place, the Clinical visit occupies only one hour. During that visit, the Physician puts very few questions to the patient; indeed, he reads his report from a paper previously made up by his clerk; so that going round the Clinical wards here and visiting them, to the great majority of the students, is absolutely unprofitable; and the visit might as well be made in the lecture-room as by the bed-side of the patient. It is impossible the system can be otherwise here, when one hour only is allowed for the Clinical visit.

In what way is the system conducted at Paris?—Clinical instruction occupies about four hours of the Clinical teacher, in the Faculty at Paris. In order to allow the Professor to

University of Edinburgh.

Dr. W. Cullen.

11 November 1826.

devote that portion of time to it here, the visit must be made at another hour than from twelve to one, which is the most valuable part of the day to him; the physician must, at the bed-side of the patient, ask questions himself in a distinct tone of voice, and repeat the answers in an audible tone; he must dictate his reports audibly, and afterwards he must not only lecture upon the case, but, as is the practice in the Italian and German Universities, he must examine the students on these reports, and gradually teach them to form their own opinions, and not deliver his own, until he has examined the students, and seen which of them has formed a correct opinion, and which has formed an erroneous one. The work of a Clinical Professor ought to be an exceedingly laborious one; and unless it is a very laborious one, and the Professor is a kind of domine, I do not suppose much valuable practical Clinical instruction would be derived; and, accordingly, the Graduates of this University, however well informed in the literature of their profession, though they generally take one course upon the prognostics of disease, are frequently ignorant of it when they enter upon practice.

Is there no risk that that elaborate sort of examination of the patients, in the presence of a great number of persons, must be very detrimental to them; or does it happen in the French hospitals?—It is never complained of there, practically speaking. Here, there are certain considerations: a person suggests what is expedient, in a medical point of view; it is in the discretion of the Professor to reconcile that with the utmost possible attention to the comfort of the patients.

What number of students attend the Clinical Professor, connected with the Faculty and different hospitals?—It is according to the celebrity of the Professors: occasionally the numbers are enormous, and it is an exertion of muscular strength, and not without danger, to obtain access to the bed-side of the patient in Paris.

Are the Clinical lectures given by the Professors in rotation in Paris, or are they fixed to a particular Professor, to lecture through a course?—I believe two Professors lecture at once, one in one amphitheatre, and one in another; and the students have it in their option to attend whom they please; and the one who has the greatest celebrity will be followed by the great majority; so that, in reference to the number of students, and to obviate the great inconvenience of such a number attending one Professor, care must be taken to balance them equally against each other.

From your observation, do you think that the most advantageous plan, or the method followed here of several Professors lecturing clinically in rotation?—With reference to that point, the most celebrated Clinical lectures have always been those which have been delivered by one person, long in the habit of doing so. He not only acquires a great experience, but a most useful kind of experience; so that nothing is lost from the manner in which he is compelled to analyze every case, and to draw conclusions from it. When Professors succeed each other, from three months to three months, there must be less experience acquired comparatively; but there are advantages in having alternations of Professors. The practice of Physic is not uniform—different theories and practices prevail; and when students have the means of attending a succession of Professors, they have different opportunities of seeing the different methods of cure employed. Those Clinical lectures which have been most celebrated and distinguished, have always been by stationary Clinical Professors.

Would it be practicable, from the means furnished by the Hospital here, especially by the Infirmary, for a gentleman to give as complete a course of Clinical information as is practised in Paris, or would be practicable in London?—They could not give such courses of Clinical Medicine as are practised in Paris, for this reason, that there is a Bureau Central, for the admission of patients into the hospitals. To that Bureau, all kinds of patients must present themselves, except in cases of accidents, when they are at once put into the nearest hospital. When they can, they make their appearance at the Bureau Central, and undergo an examination by an experienced Surgeon or Physician. The Clinical Professors have it in their power to send to this Bureau Central the number of beds they have unoccupied, and the kind of cases they would wish; and these are immediately sent to them; so that, by means of this arrangement, they have it in their power to exhibit a succession of most interesting cases. Every practitioner in Paris, who chooses to study any one particular department of Medicine, has the most ample opportunity for it; he has only to state, at the Bureau Central, that he wishes to have patients of that kind sent him. The diseases of the brain have of late excited considerable attention. The Physician, who has devoted himself to that investigation, has constantly had his hands full. The Hôpital de la Charité has long been celebrated for attention paid there to the diseases of the chest; and, accordingly, a great majority of the beds of the Physicians of the Hôpital de la Charité are occupied by cases of thoracical diseases. The same system prevails here, but to a less degree, among the Clinical Professors, for they have power to select the most interesting cases.

To have the full advantage of that system, is it necessary there must be a much greater population?—There must be a much greater population. It is impossible to expect that by any kind of theoretical arrangements, in such a place as this, we can supply the want of practical information.

But, if in London a good system were adopted, might that not be done?—Yes, if a good system were adopted between a University and the different Hospitals, it might be done; but it would be difficult, on account of the London Hospitals being private property; and corporate bodies are commonly most untractable.

Would you say that the cure of the patient is as carefully attended to, and successfully followed out, at the Hospitals at Paris, as it is in London, and in this country?—Infinitely better than those in London. The Physician at Paris visits the patients every morning; the Physician at London visits them only once a-week; and very often, for the rest of the time, the patient is left to the charge of an Hospital pupil, who sends for his principal only on some

University of Edinburgh.

Dr. W. Cullen.

11 November 1826.

urgent occasion. The Hospitals in Paris are most admirable in point of ventilation, cleanliness, and every attention to the comfort of the patients.

Do the Physicians, who give Clinical lectures at Paris, act, at the same time, as Professors of other branches of Medical Science?—The Professors of Clinical Medicine in Paris, according to the arrangements of the present Faculty, lecture upon no other department of Medical Science in the Faculty: but, independent of the four Medical Professors under their control, there are Clinical lectures given, under the sanction of the general Administration of the Hospitals. These lectures are often given by persons who are Professors at the Faculty, under the general Administration of the Hospitals; for instance, the Professor of Therapeutics at the School of Medicine, delivered a course of lectures on the Diseases of the Skin. The Professor of Anatomy at the Faculty, delivered Clinical lectures upon Surgery at the Hôpital de la Pitié; and the principle is perfectly established, that, under the sanction of the Administration of the Hospitals, though Professors of the Faculty, they may give lectures at their own Hospitals.

Are there any other Clinical lectures on Surgery at the same Hospital, besides those that are delivered by the Professor of Anatomy?—The Clinical Surgery is carried on at two Hospitals: the one at the Hôtel Dieu, that goes on all the year; the Professor makes visits, performs operations, and, according to the cases, does, or does not, deliver lectures immediately after the visit, and after the performance of the operations. Through the hands of that Clinical Professor, five or six thousand cases pass annually. The other is the Hôpital de la Charité; there are two Professors of Clinical Surgery there, and this visit is precisely of the some kind, and occupies the same time as at the Hôtel Dieu. They make the visit, perform operations, and deliver lectures; and, besides, the Professor examines the students in the way I have mentioned, as being such a desideratum in this University.

Are any other lectures upon Clinical Medicine or Surgery, recognised, besides those which are given by the Professors?—None are recognised by the Faculty; they are given, merely by an arrangement of the Administration, for the benefit of the students.

Are there not as many Medical classes, in the winter, at Edinburgh, at present, as the students can attend with advantage?—There are more Medical classes here than the students can attend; indeed, there are so many classes, that the students are sadly puzzled which to choose; and, after having made the choice, no time is left them to attend Practical Anatomy, which is a very great loss.

In order to make way for the additions you have been recommending, would it not be necessary to remove some of the present lectures?—Yes, they should be removed to the summer session, and the sessions of the University should be divided into Semestres.

As the Medical course extends to four years, do you think that the number to be attended in any one year would be too great?—I do not think so. They are not only not too great, but in Paris, the Anatomy, Physiology, the Pathologie Interne and Externe, are attended twice in four years.

When you gave an answer with respect to the too great number of winter classes, had you in your mind the old practice of three years, or the new regulation of four years?—It was given with reference to the old regulation, when the students attended what classes, and in what order they pleased. Perhaps a good deal of inconvenience depends upon the students attending out-door lectures.

Would you have the goodness to state the manner in which the study of Anatomy is pursued at Paris?—Independent of the lectures of the Professor of Anatomy, there are lectures which are exceedingly well attended upon Practical Anatomy. In order to encourage Practical Anatomy, there is a sort of sub-professor Agrégé, termed le Chef des Travaux Anatomiques, who has unlimited control; and a part of the course is appropriated to dissections. It is his business to attend them, and to see that there is a supply of dead bodies. He has persons under him to assist him. There are two Prosecteurs; and under them, again, there are four Aides d'Anatomie. The duty of these individuals is, that they shall be, more or less, in the dissecting-room, ready to assist the students, and superintend them in their studies; but they do not do so, and the students are left very much to themselves. The obtaining of a supply of dead bodies is, in a considerable measure, dependent on the activity of the students. They go into the hospitals and houses, and mark the body, by putting a paper upon it with their names, so that, when it is brought to the School of Medicine, or the Hôpital de la Pitié, it is claimed by the person who put his name upon it. Those who are active in going to the hospital early, get a supply of dead bodies, in the best possible condition; those who do not use that activity are sometimes worse of. When I was in France, I attended lectures upon Chemistry, and Comparative Anatomy; but those lectures are not particularly applicable to Medicine. In the Collége de Plessis, and the Collége de France, lectures are given upon general scientific subjects twice a-week. Those lectures, at the time I speak of, were quite public; any one might attend them. The lectures on Chemistry were exceedingly well attended; those upon Comparative Anatomy much less so. I do not know the organization of the Faculty of Sciences, or the Faculty of Law, or the Faculty of Letters.

Is it in your power to afford the Commissioners any information upon the System of Study, the Rules, Regulations, and Discipline of the different Colleges belonging to the University of Paris, in the Faculty of Arts?—No. I know the question has been agitated frequently, as to the propriety of a preliminary education at this University, with respect to degrees in Medicine; but it seems to me that will require the very deepest consideration. It is very desirable, undoubtedly, that those who take degrees should possess as high qualifications as possible; and, if they are men of Letters, and men of Science, the degree of Doctor of Medicine would be proportionally more respected; but Medicine being a practical art, which is to be exercised for the good of the community, attention must be paid to the demands of

University of Edinburgh.

Dr. W. Cullen.

11 November 1826.

the public, and it is unreasonable, perhaps, to expect that Medical men who are about to establish themselves in the country, where the scale of remuneration is small, and where the demand for general knowledge is not so great, should possess the high qualifications that some aim at.

Should you think it would be too much to require a competent knowledge of Greek, in addition to Latin and Mathematics?—I should think it of much more importance that the student should have a competent knowledge of French than of Greek; and I do not see of what practical use a course of Mathematics is to be at all. Medicine is a practical art, and those who have been renowned as the best practitioners, are very far from being celebrated for their amount of general information. The man who has done most for Medical Science, in this country, was most grossly illiterate—I mean Mr. John Hunter; and it is an observation generally, in the profession, that those who have had the best literary education (I speak of the Graduates of Oxford and Cambridge) are considered by the bulk of the Medical practitioners rather as amateurs.

Are you aware if the number of Medical degrees taken at Oxford and Cambridge is extremely small?—It is small compared with the number in this University.

Do you know if the Medical degrees of those Universities are chiefly taken to qualify the candidates for certain offices?—Yes, to become members of the College of Physicians of London.

Are those degrees very often taken, when Medical education has not been followed at Oxford or Cambridge?—Constantly so; the degree of Doctor of Medicine is granted to them after having been a certain time Bachelors of Medicine; the degree of Bachelor is granted after the production of certificates of attendance upon particular classes.

Do you know, if, in the Army regulations, considerable proficiency in what may be called Preliminary Studies is required?—I am not acquainted with the preliminary qualifications required by the Army regulations.

Have you any doubt that this political measure of the French Government, by which they appear to have changed the constitution of the Faculty of Medicine at Paris, will be likely, in its result, to add greatly to the reputation of the French School of Medicine?—If I were to give any opinion, I would say, that it will have a tendency greatly to diminish the reputation of the French School in the long run. It is not the system of previous education that will increase or diminish its reputation; I allude to other reasons. Formerly, the appointment of the Professors of the Faculty of Medicine in Paris was the work of the Faculty itself; the appointment of them lay with the Faculty, and was determined entirely by the merits of the candidates, established at a public Concours, before Medical men, who were Juges de Concours, the cleverest men that could be got. Many of the Professors of the University of Paris, I dare say, entered the city originally without shoes and stockings; and by the provisions of the ordinance now in force, though not ostensibly, Government has the appointment of all the Professors. Of all those who were named in the ordinance of 1823, there were many who had never been heard of. The effect of this system will be, to throw the patronage into the hands of Government; and in a country where prejudices run so high, and are acted on with so little reserve, we may rely upon it, the nomination will not be to the most worthy, but to the most religious and most monarchical. The Court Physicians and Surgeons will be preferred to all other candidates.

But, with reference chiefly to the new system of education, do you think that, supposing the Chairs were to be worthily filled, that new system will have the effect of making the School of Medicine much more efficient than it is now?—It will have no effect in that point of view. I think the School of Medicine will not be more efficient, because the students are presumed to have been the students of another Faculty. It can have no effect in increasing the number of students at the Paris University.

Do you think it will have the effect of making their education more useful, and producing better students?—It may have the effect of diminishing the number of Doctors of Medicine, and compelling many to become Officiers de Santé who formerly might have aspired to the Medical degree; it may diminish the number of graduates, without diminishing the number of students.

Do you consider that that is likely to be detrimental to the interests o Medicine, by diminishing the number of graduates, and inducing more to practise upon the inferior degree?—It cannot fail to be so, if it increases the number of Officiers de Santé, at the expense of the Doctors of Medicine. As the qualifications of the Officiers de Santé are less than those of Doctors of Medicine, it must have a bad effect upon the Medical profession; but this is merely my opinion as to what I think likely to happen.

Do you think, that, if a previous knowledge of Greek and Mathematics were required in candidates for Medical degrees, at the University of Edinburgh, it would have the effect of diminishing the number of those graduates?—Certainly, I think it would have the effect of diminishing the number of candidates for degrees, particularly if examination on these points were required; and it would increase the number of those who would content themselves with the degree of Surgeon.

Do you think the result of that would be prejudicial to the interests of Medicine in this country?—No, because the qualifications demanded by the Royal College of Surgeons here are, in some points, superior to what are required for a Doctor of Medicine.

If a previous knowledge of Greek and Mathematics were required both of candidates for the Medical degree and from candidates for the diploma of the College of Surgeons, what, in your opinion, would be the result, as it regards Medicine in general?—The number of those who have taken Medical degrees has increased of late years in a very great ratio. This is not entirely to be attributed, if I may so say, to the increased celebrity of the University, but

University of Edinburgh.

Dr. W. Cullen.

11 November 1826.

to the general circumstances of Medical education. Formerly, the degree of the College of Surgeons was an inferior degree; the qualifications that were required for candidates were less; and many persons contented themselves, as it was a cheaper degree, with taking it; but the College of Surgeons have, by degrees, increased their qualifications, until it is now as difficult to get a Surgical diploma as it is to obtain a Medical degree. Therefore, students now take the degree of Doctor of Medicine, because, in order to get merely a Surgical diploma, they must have gone through the regular course of instruction necessary to receive the former. Therefore, if the College of Surgeons also were to insist upon a knowledge of Latin, Greek, and Mathematics, along with the Faculty here, I presume that the number of the present candidates would continue as before, in relation to the College of Surgeons of this place; but I have no doubt, that if Latin, Greek, and Mathematics were insisted upon here, as a preliminary education, involving, of course, the attendance of another year at the University, that we should then have rising in opposition to us some of the other Schools in Scotland; for men must and will go where they can have their education at the rate they are best able to afford in general.

What would be the result, supposing the same system were to be introduced into all the Universities throughout Scotland?—The University of the capital will have the preference.

Do you apprehend any bad consequences would be likely to follow from that system, by introducing into medical practice a lower class of practitioners than those who obtain the degree of Doctor of Medicine, or the diploma from the College of Surgeons?—I think it exceedingly likely. That system has begun, to a certain extent, in Edinburgh; for there are many Apothecaries in town, who keep open shops, who are in considerable practice; and if they practise at a cheaper rate than Surgeons and Physicians, in spite of the superior qualifications of those two latter, they will in the end have a considerable share of the public practice.

Has it not long been the case that Apothecaries did practise in Edinburgh?—Formerly, it was understood they did not practise out of their shops; they gave advice behind the counter, but they have now Surgeon's diplomas, some of them, in addition, and some of them not, and they practise as extensively as they please.

Do you not understand that the number of applications for the diploma of Surgeon has really increased?—The number of applications for the diploma of Surgeon has of late increased uniformly as the qualifications have been raised.

Were not the qualifications for the degree of Doctor of Medicine much higher than those required by the College of Surgeons until of late years?—Considerably higher.

To what causes do you attribute the increase of application for the diploma of the College of Surgeons?—In a great measure, to the demand of the Army and Navy, for which these qualifications are required.

Has the demand diminished since the peace?—I presume it must have done so considerably since the peace.

Then you do not understand that the number of diplomas granted by the Royal College of Surgeons here has decreased since the peace?—It has, I believe, every year increased. There were more students here last year than at any previous session. Many persons took degrees from both Colleges. Formerly, the Surgical degree was thought quite an inferior thing, and a Doctor of Medicine disdained to have it. The Surgeons, of late years, have increased in respectability and in their sphere of practice, and their diploma has also increased in respectability.

If the numbers have not diminished since the peace, must not some other cause exist for that continued increase than the demands by the Army and Navy?—There is a general afflux to the University, the causes of which I do not pretend to say, and I can only suspect the general state of the population of the country.

Although, in your opinion, the effect might be doubtful, to require the additional previous education, to which reference has been made, for the ordinary degree of Doctor in the University, do you think it would be prudent to institute a higher degree, which persons, ambitious of distinction, might take, such as Doctor of Philosophy and Medicine, which was formerly known, and may still be known, on the Continent?—It is known in several of the Universities on the Continent; but as I believe Medicine is a practical art, and that a man becomes an accomplished Physician, and well skilled in the treatment of disease, by seeing it at the bedside of the patient; I believe the acquisition of Latin, Greek, and Mathematics, would not greatly assist him in that particular. *Morbi non eloquentiâ, sed remediis vincuntur.* It may have a general fictitious sort of esteem in the minds of the public, but those persons will be most frequently called into consultation who have performed successfully the greatest number of cures, whether they know Latin or Greek or not.

Considering the degree conferred by the University as an Academical honour, and that the Profession is a learned one, do you not think it would be advisable to have the means of such distinctions, as have already been adverted to, provided by the University, without rendering it imperative, or interfering with the existing degree?—I do not think it necessary, for the benefit of the Science, that there should be such a high qualification; the books which are to be read in Greek, amount almost to nothing; those that exist, are translated into the Latin; there also exist translations of the Latin Classics, and they are read more than the original sources of information, which are consulted very rarely. I do not know more than one practitioner, at present, in Edinburgh, who is a Greek scholar.

If all such books are now translated, might not what you have now mentioned be an objection to Greek, as a preparative to any profession?—If it were desired, and thought absolutely necessary, it would be most advantageous that they should learn French, in which so many admirable works have been published. Unless a person reads French nearly as well as his

University of Edinburgh.

Dr. W. Cullen.

11 November 1826.

native tongue, his knowledge of Medicine must be very limited. When we consider the vast expense of Medical education, and the time necessary to procure it, we should take care that, by increasing the difficulty of obtaining the degree, we do not throw Medical practice into inferior hands. There must always be, in the Medical profession, inferior Practitioners, for the benefit of poor people in distant parts of the country; and they could not be put an end to without detriment to the public.

Could any better use be made of the early period of life, than by acquiring a knowledge of the Classics?—So far as the acquisition of the Classics tends to the development of the mental powers, it is highly desirable. The great zeal for instruction on the part of the mechanics, and all the branches of the community, is rather for practical than theoretical information.

Edinburgh, Monday, 13th November 1826.

The EARL of ROSEBERY in the Chair.

The Reverend Sir *Henry Moncrieff*, Bart., D.D., called in and examined.

Rev. Sir H. Moncrieff.

13 November 1826.

The Commissioners are desirous of receiving any opinions you may have formed, in the first place, with regard to the Education and Discipline of the University generally; and next, to the Theological Class more particularly?—I have had but little access to know much about the Discipline of the College. I was not educated here myself, and the greatest part of my family were educated at a different University. I can, therefore, know very little about the ordinary practice of this University: but I can say, generally, that there is one thing which would be very material in the management of the classes,—that the attendance of the students should be more enforced than I believe it to be—that there should be much more strict and regular examination of the students on the subject of the lectures—and that, especially in the classes of Philosophy and Theology, the questions put to them should not be so expressed as to require no other answers than "Yes" or "No."

Does that opinion refer to all the branches of education given in this University?—To all, without exception. I think there is too little examination, and that too little is done to enforce regular attendance.

Would you wish to suggest anything else with respect to the Constitution, Discipline, or Education of the University, generally speaking?—I do not mean to suggest anything—I am not entitled to do this; but I think there is no such thing as securing attendance, but by regular catalogues, called over every day, and especially at the examination hours. I recollect to have heard, that in many instances, at present, when there is examination, the students are not compelled to attend at the examination hours, and that these are commonly the thinnest in point of attendance.

Are you of opinion that the loss of time in calling a catalogue is of any consideration?—I think it of none at all. On the contrary, it is greatly in favour of the usefulness of the class, if the Professor himself correctly observes the hour of meeting.

Does anything occur to you with respect to lengthening the session?—I think the session, instead of being too long, is, in many of the classes, greatly too short; it is shorter than the sessions in the neighbouring Universities, at least in one of them; and it seems to me to have, of late years, been gradually becoming shorter here.

Would it therefore, in your opinion, be an improvement to make a longer session?—Yes, I certainly think so.

Do you conceive that there is anything in the pecuniary circumstances of the students which would render it so inconvenient as to make it prudent to hesitate about enlarging the period of the session?—No; I do not think there is anything that I can imagine which ought to have this effect, if it is really intended that the students should receive an efficient University education. But I know very well this, that the evils arising from shortened sessions would never be cured, as long as there is no efficient discipline to secure the attendance of the students while the session lasts. I have heard of students who came from the country and have been enrolled, who, without the knowledge of the Professor, have given little, or almost no attendance at all. The Professor does not see them, but he does not miss them. I remember to have heard of one instance, in which a schoolmaster from the country, who was in one of the Philosophy classes, was understood to have been certified at the end of the session, as having given regular attendance; though it was believed that he had never been three days absent from the country school which he taught, upwards of twenty miles' distance from Edinburgh. I am sensible, however, that this is not an answer which bears directly on the question put. A little more expense would certainly be incurred by a longer session; but I do not think this affords a substantial reason against prolonging the session, when the efficiency of a University education is in question.

Will you have the goodness to inform the Commissioners, whether, with reference to the pecuniary circumstances of the students, particularly the students of Divinity, you do not think it would be a great hardship to increase the length of the session?—No, I do not think so; I do not see how it should be a greater hardship to increase the length of the session, supposing it were carried on to the month of May, than it is in the University of Glasgow, where students are at least as poor, and the inconvenience would be as severely felt as it can be at Edinburgh.

Would you propose to make the session longer in Edinburgh than in Glasgow?—No; I would not propose a longer session than the usual session at Glasgow.

But would you wish it to be as long?—Yes.

Did you study at the University of Glasgow?—Yes.

Do you remember what the length of the session was at that period?—There were some

University of Edinburgh.

Rev. Sir H. Moncrieff.

13 November 1826.

innovations during the time I studied there; but it must be recollected that I am referring to a period upwards of sixty years ago. The old rule was, that upon the 10th of June the session rose; but the greatest part of the young men were very commonly away by the 20th of May, and regular attendance was not much given after the first week of May.

Were a great proportion of these students in humble circumstances in life?—A great proportion of them certainly were.

According to your recollection, did they attend as regularly as the others?—All of them were in use to attend until May, when I was at the College; and I think they were accustomed to do so while my sons were there, many years after that time. I do not pretend to know what the practice has been of late.

Did the session commence on the 10th of October?—It commenced upon the 10th of October, but the classes were never filled up till the beginning of November; many of them did not begin the proper business of the class till then.

Have you ever taken it into consideration, whether it would be an improvement to elevate the degree of Master of Arts in the public esteem in this University, so as to create emulation among the students?—I think it would; but I think it is not peculiar to this University that too little strictness is observed in conferring this degree. If there was anything slovenly about Glasgow when I was there, it was in the facility with which the Master of Arts degree was conferred.

Would you wish to see, in all the Universities, this degree raised higher in the public estimation than it is now, so that the honour should be greater?—I certainly think so.

Do you not think that there would be an emulation excited among the young men, to endeavour to obtain that degree, which does not at present exist among them?—Surely; there is none at all at present.

Do you think that stricter examinations should precede the granting of them?—No doubt the examination ought to be much stricter than it has lately been.

Would you wish to see that introduced?—Certainly; and I think it would have been introduced sooner at Glasgow, but from a circumstance that does not exist now, I believe. At the time I was best acquainted with the University, a great body of Irishmen came over, whose success in life depended on getting a degree; they came two years to Glasgow; they commonly gained a Master of Arts degree. I think that was a great disadvantage to the University, but I believe that the practice has been discontinued for many years, though this I have no occasion to know.

Do you remember how many hours in the day each class was assembled in the Literary departments when you studied at Glasgow?—Very distinctly. In the different classes the hours were not the same. In the Greek class, there were two public hours and a private hour; the private hour was only employed three times a-week. In the Logic class, there were only two hours a-day. In the Moral Philosophy class, there were just two hours a-day. In the Natural Philosophy class, there were the same; and, once in the three days, there was, in the Natural Philosophy class, an hour for experiments.

Would you think that a shorter attendance than you remember to have been given there would be too little to be adopted here?—I am not speaking of the regulations in Edinburgh; I know less of them a great deal. I think the attendance at Glasgow was sufficient; I think there would be no occasion for extending them, especially if the catalogues in each of the classes were regularly called, and the examination hours were regularly attended by all the students.

Have you any further suggestions to offer to the Commissioners, previous to entering upon the subject of the Theological classes?—No, I have nothing particular to mention, beyond what may be collected from what I have already said; I do not recollect anything else.

Are you of opinion that a stricter discipline would be of advantage to the University, either by giving greater authority to the Senatus Academicus, or the Principal, or some constituted authority in the University?—There certainly should be an oversight, where it is necessary, with regard to discipline; but the discipline of each class may be well conducted by the Professor himself, if he understands the sort of discipline that is prescribed to him.

Are you of opinion that the First Greek class, in which the elements of Greek are taught, could be with safety dispensed with, looking to the state of the schools throughout the country, and the previous circumstances of many of the young men who come to study here?—Looking to the state of the High School of Edinburgh, I can very well say that the first class of the Greek might be dispensed with; but, looking to the state of schools in general, I am not sure I may venture to say that. It is pretty well known that the teaching is not the same in country schools, and that a great proportion of the students who attend here and at the Universities come from country schools. Some of the country gentlemen, and even of those who pretend to take a lead in the management of affairs, have of late taken up the foolish idea, that it is not only unnecessary, but inexpedient, that either Greek or Latin should be taught in country schools; and have had more influence than is generally known in bringing this innovation into practice, which would ultimately have the most mischievous effects on the condition of the country. It becomes so much the more important that these branches of education should be more than ever attended to in the Universities.

Do you think that many of the young men who come here to study for the Church would not have it in their power previously to learn Greek?—As far as I know the state of the country schools, I think they scarcely could; and perhaps, for that reason, though there were no other, it would not be very wise if there were not a First Greek class, to which students from the country could go.

Have you formed any opinion as to the necessity of Examinations in the Literary and Philosophical classes?—I certainly have a very strong opinion on that subject; I think a great

407

University of Edinburgh.

Rev. Sir H. Moncrieff.

13 November 1826.

deal of attention should be paid to it. Every student should be regularly examined; the Professor may be the judge himself how often it should be done. Formerly I remember, at Glasgow, there was an examination of an hour every day in the Literary and in the Greek and Latin classes, and it extended to every student in the Philosophical classes in the College. The first hour of the day was appropriated to lecturing, but the second hour was for examination; at least this is my recollection.

Was that system attended with very beneficial effects on the students, or do you think they were superior in their education to those who are educated according to the present mode?—I will not say that generally, as applied to their character through life; but a man's superiority, as he advances in life, depends much more upon himself afterwards than on any of his attainments either at school or in the Universities.

Did that system enable the Professor to ascertain the acquirements of the student?—Yes, and to assist his acquirements.

The Commissioners are desirous of hearing any opinions you may have formed with respect to the classes included in the Theological Faculty in this University, or any suggestion you may wish to throw out to them, with a view to alter or improve them, in any shape that you conceive would be beneficial?—I have not had much opportunity of seeing what is done in the Divinity classes here, as I have been connected with no person particularly attending them; so that my opinion is to be taken with a grain of allowance. There is one very obvious remark: I think examination is requisite there as well as elsewhere; and I think that, without a regular catalogue being every day called, no attendance can be secured, and that, under the present system at Edinburgh, it is not, in fact, secured; I am perfectly convinced of this. The Professor not having time for it, is no reason at all why there should be no catalogue; I am sure the students take advantage of that circumstance, and a great many of them do not attend at all. I have access to know this, from students who sometimes visit me; and I know they do not attend regularly. I should suggest that the examinations in the Divinity Hall should be as regular as in any of the other classes. This is done, I understand, at Glasgow, where the number of students is but in a very inconsiderable proportion below the numbers at Edinburgh.

Besides Examinations, and the regular calling of a roll or catalogue, which is not now done, is there any other improvement in these classes that you would recommend to the Commissioners for adoption?—There is no class in this University for Biblical Criticism, and it is no part of the duty of any of them to give anything in the place of it. I think its introduction would be a great improvement indeed.

Is there such a Professor in St. Mary's College, at St. Andrew's?—Yes, there is such a Professor; whether that is the proper business of his class I cannot pretend to say. The late Professor, Dr. Cook, gave regular lectures upon Biblical Criticism, and they were both very good and very useful.

Are you aware that Dr. Gerrard, at Aberdeen, gave lectures upon the same subject?—I have heard so; but I have not had access to know it. I have no doubt whatever it would be a great advantage to the University.

Do you think that the duty you have just adverted to, might be assigned to the Principal?—There is nothing in the Principal's situation, surely, to prevent him from fulfilling that duty, and he is, by his patent, I believe, first Professor of Divinity. But in that case it should be specifically stated that it is the business of his Chair.

It having been stated in evidence to the Commissioners, that the number of lectures which the Professor of Divinity gives, is very much limited, in consequence of the duty devolving on him of hearing the Discourses of the student; do you think there would be any objection if that duty were devolved, either in whole or in part, upon the Principal, so as to leave to the Professor more time to lecture?—I think the Professor should have an additional hour for lecturing, which should be confined to that. I think if the Principal had Biblical Criticism to lecture upon, he would have enough to do. I should rather think that the Professor of Divinity is the better person to hear the Discourses; but he certainly cannot do that and lecture at the same time, if he has but one hour of meeting. The Discourses may often relate, of course, to the subject of his Divinity lectures, and may be naturally connected with them. It lies with the Professor of Divinity himself to prescribe the subjects of the Discourse, and he is the proper person to hear them.

Is it the result of the present system, that a great proportion of the time of the session is now occupied at the Divinity Hall in hearing Discourses, and that, comparatively speaking, but a very small proportion is occupied in lecturing?—That is certainly true, especially after the session has gone on about two months; but that is owing to this circumstance, in a great measure, that a number of the young men whose names are enrolled, never attend at all; they come up for two or three days, and deliver Discourses which have before been prescribed, and then go away.

Are the Commissioners to understand it to be your opinion, that, to enable the Professor of Divinity to deliver a proper course of Theology and to hear the Discourses, he ought to have at least two hours a-day?—I think so, certainly; and, unless this shall be done, that he can do little as a lecturer.

Is it your opinion that the irregular attendance of the students at Divinity Hall is disadvantageous to the interests of Literature and the Church?—I think it very disadvantageous. It would be better if they attended regularly; but I do not know how this can be arranged under the present system of management.

Will you have the goodness to state the difficulties that occur to you in the way of effecting an alteration in it?—There are some obvious difficulties; many of the students are schoolmasters in the country, and a great many of them tutors in private families at a distance; and there is no doubt, that, if you should require regular attendance from these, it would of

University of Edinburgh.

Rev. Sir H. Moncrieff.

13 November 1826.

necessity impose some hardship upon them; but I am not sure that this would not be compensated to the Church by requiring more attendance here. I am, indeed, of opinion, that it would be compensated sufficiently: we have a great superabundance of students in Divinity, for whom we are not able to provide at present.

Do you understand that the object of that irregular attendance is merely for the purpose of enabling them to deliver a certain number of Discourses?—No, I do not think so. I am not aware that one has much connexion with the other.

What do you understand to be the object of allowing irregular attendance, independent of the opportunity of delivering discourses?—It enables many students, who are poor, and not able to bear the expense of attending here, to be licensed, without having given much attendance; it is by many thought to be of great advantage, but I think it none.

Do so many years of irregular attendance entitle them to licences?—Yes. I do not think the Church or the public would suffer if a much more constant attendance were to be required.

Do you know if only one day's attendance, in each of the years for which they are irregular students, is sufficient?—I really cannot say what is required here; but they are often certified to have given a certain degree of regular and so much irregular attendance, which, being both general terms, have not always a very definite meaning.

Would you think it, therefore, beneficial to restrict the licences to those who gave a certain degree of regular attendance?—If they were required to give a certain prescribed attendance, the number of years they had regularly attended would be certified; and, if the rule laid down were strictly observed, the effect would soon be seen.

Would you recommend that a certain number of years should be specified, when their attendance must be imperative, previous to getting a licence?—I think it would be of great advantage. I do not speak of its practicability.

Do you not think it would be of great advantage to the public, and to the Church, if that could be effected?—Clearly; there can be no doubt on that subject.

In order to make any alterations of that sort effective, should they not be imperative upon the students?—I think they should be imperative, both upon the students and the Professor; for he would be required to certify that the attendance required had been given.

Do you know if the present system is according to the law of the Church, and was settled by the Church?—I do not know whether it is well settled; for we have been sending new overtures almost every year on this subject, and with great changes in them all. I do not know that the latest changes have always been for the best.

Do you think, in order to render any alterations of that sort effective, it would be necessary to have the sanction of the Church to them; or might they be made by the University, or by any other competent authority?—It would be at least desirable that the sanction of the Church were obtained; for, if the Church were not satisfied, they might license men who had not given the attendance required; it is, at least desirable, that the consent of the Church should be obtained—how far the authority of the Commissioners may go, I cannot pretend to say.

Do you think it would be of advantage to diminish the number of Discourses delivered by each student, to give the Professor more time to lecture?—No, I really do not think so. The students were required to give five years' attendance; six was the original number, but five years' attendance has been introduced latterly. All the discourses that are required in the Theological class, are no more than five still; and I do think that these exercises may be composed by the student, without any encroachment on his time, and with advantage to himself. I do not see, if the Professor had two hours in his class instead of one, that there would be any unreasonable encroachment upon his time, by the whole number of discourses at present in use; though it might require some arrangement to prevent too many from being offered on the same day.

Do you think the labour of hearing Discourses might be diminished by having it divided among the several Professors of Divinity, upon the supposition that more than one Professor lectured; so that, for instance, what is called the Exercise and Addition might be prescribed by the Professor who lectured upon Biblical Criticism, and might be heard by him?—There would be no great disadvantage attending that arrangement; but I think it is better that the Professor, who is at the head of the Divinity Chair, should give the certificates; and he can scarcely give them, if he does not personally hear the students deliver their exercises.

Do you consider, with reference to the subject of irregular attendance, that the study of Divinity can be advantageously prosecuted by a young man living in the country, away from books, and in the situation of a poor tutor, in a remote part of the country?—I do not pretend to say: he may not acquire all that is necessary there, but it is not an University acquisition, and such a regulation as thus supposed, might be applied to every class in the University, and would ultimately render our University useless.

Must not such a person in general have but little access to books?—He has not access to half the books he should have.

Do you think it would, in general, interfere with the private practice of students in Divinity if the first and second years, at least, of their attendance were made regular, as many begin the study at the age of 17 or 18?—I think that, at least, there should be three years' attendance. The Professor's lectures, one time with another, upon a course of Divinity, are not finished in less than three years.

Do you think that, in ordinary circumstances, young men of 17, 18, and 19 years of age are fully equal to the duty of superintending the education of the young, and at the same time sufficiently carrying on their own studies, in so important a department as Divinity?—No, not taking one with another; but men in ordinary circumstances, I think, would require more study.

404

University of Edinburgh.

Rev. Sir H. Moncrieff.

13 November 1826.

Would they not, in general, be better fitted for acting as teachers of youth in schools, if they were not to enter upon those duties until, at least, they are perhaps 20 years of age?—I certainly think so.

Are the Commissioners to understand that the regulations of attendance that is requisite for students of Divinity, have been frequently a subject of discussion in the General Assembly, and throughout the Church?—Yes; but the alterations made there I do not think have been always the wisest, and it is certain that they have been too frequent. In the beginning of my life, the least of regular attendance that was required was four years (it was constant and steady attendance); afterwards, the number of years was permitted to dwindle down to three years of regular attendance, and afterwards to two; and, of late, I have heard individuals talk of one year. Whether they have come to this in their printed regulations I do not know; the Statutory Regulations are but recent. I remember a case that was before the Assembly, where a young man had never been in Divinity Hall at all, but professed to have studied Divinity under his father, who was a clergyman; and, on referring to the authorities at that time, no fixed or imperative regulations were found to exist. On this ground, that individual was permitted to be introduced to the Church, although he had never in his life been at the University, or at a Divinity Hall; and it was after this time that the stricter regulations began to be introduced. That case occurred about the year 1772.

Do you think it desirable that every Professor of Systematic Divinity should complete a course during the years which are required for the regular attendance of students?—I think it very material he should do so; and for that reason I do not think that the attendance of two years is sufficient in any case.

Are you aware if an overture upon the subject has been brought before the last General Assembly?—I have heard of that; but I do not know what the overture contained, and I do not think that it has been mentioned to me.

Do you think that, with propriety and safety, fees to any extent could be taken at Divinity Hall?—I rather think they might, but at a low rate. They ought to be prescribed and limited if the practice were adopted.

Do you think that this would be an improvement?—I think that what a man pays for he takes more pains to avail himself of, than he will do with regard to that for which he does not pay. There would be a good deal of clamour excited against such a regulation, and perhaps chiefly among those who are not the best qualified.

Do you think moderate fees would have the effect of excluding from the Church any of the students to whom at present access is open?—I do not think it would; and, if that were possible, there are always ways in which a man who deserves would be able to procure it.

Are the same students who enter Divinity Hall obliged to pay fees at the previous Literary and Philosophical classes?—Yes, they are; and I believe they pay fees at the class of Oriental Languages; *that* is an innovation, though not a late one. There were no fees there originally; but they were introduced some time between 1760 and 1770.

Do you know if a great number of the Professors are in the habit of giving gratis tickets to students of Divinity?—A great many; and I never knew an instance in any of the classes of any individual who ought to have been admitted, who has not found access to a gratis ticket.

Are you of opinion that the class of Church History, taught as it is, that is, purely as an Historical class, is of any great utility?—I have no access to know how it is taught. I do not know that I have ever been in the way of hearing from any person who has given regular attendance there in what way it is taught; but, as I have understood, whatever the value of the Lectures may be, they do not go farther down than the time of Constantine; and this I do not think a sufficient course.

Without reference to the mode in which it is taught in this University, but generally, do you consider that an Historical class of that description is of as much value as a general view of the different opinions that have prevailed in different times of the Church, similar, for instance, to Dr. Cook's View of Christianity?—I do not know. I think any Professor who gives a series of Lectures upon Church History, has the opportunity of bringing forward whatever may be necessary with regard to the prevailing opinions.

Would you recommend any change in the character of that class?—Not in the object of it, at least; but I would have the teaching to go down farther than it has lately gone—at the least, as far as to the Reformation.

With the opportunities you have of judging, would you, if it could be done without hardship to the students of Divinity, wish to see the means of obtaining greater Literary and Scientific acquirements afforded them than they now possess?—No; I think they have great opportunities of acquiring Literary and Scientific information, if they choose to take it, and I do not know that any further additional advantages which a University could furnish would be very material.

Supposing such a degree were in use in this University as that which has been adverted to in the former part of your evidence, should you think that there would be any objection to requiring that, previous to entering the Divinity Hall, a student should have taken such degree, or that he should produce certificates of attendance, and of acquirements, that might be considered equivalent to it?—I see no objection to that; on the contrary, I think it would be of use.

How long, in your opinion, ought a course of Divinity to occupy, supposing the Professor were enabled to lecture one hour a-day?—I have already supposed three years; it has been done in less time, but I think, to do it justice, it should not be restricted to less.

Will you have the goodness to mention what arrangements you would propose, with reference to students who enter the second year of the course; would you wish the Professor to deliver a third of the whole course in separate hours each year, or what arrangement would you

University of Edinburgh.

Rev. Sir H. Moncrieff.

13 November 1826.

make for them?—Supposing attendance for three years were required, it does not signify how much or how little he does, if he goes on regularly; if the student does not get the whole of it at the first, he would get it at last.

Do you think attendance ought to be prescribed for the period of time for which the course lasts?—Yes; if a student come the second year, he has an opportunity of getting the first part of the course supplied at the end; or the Professor will come back to the subject of the first year's course before his Theological studies can terminate.

Is the subject one of that description which renders it unimportant which division of the course is taken first?—I will not say that; but he has always the means of supplying any chasm or deficiency.

Attendance at Divinity Hall in a University being required by the Church, previous to granting a licence to a candidate, are you of opinion that such attendance being prescribed by the Church, as the means of obtaining a knowledge of Divinity, it ought to be made imperative?—I think it should be made imperative; but that depends upon the Church.

If the Church consented to it, would you think it an improvement in the system of education?—I certainly think it would be an improvement; but no doubt there are difficulties in the subject.

From your knowledge of the circumstances of students of Divinity, and the different qualifications with which many may enter the Divinity Hall, are you of opinion that it would be necessary, as is done at Glasgow, to adopt a division of the course into two separate parts, in order to be adapted to the different qualifications of the different students?—I think, if that were done judiciously, it would be of advantage.

May not their previous attainments be very various?—Unquestionably; but that must be left to the judgment of the Professor.

Do you remember having heard any opinion expressed with regard to the value of the class of Logic and Rhetoric taught by Professor Stevenson in this University?—I was not acquainted with it, but I have always heard it mentioned with great respect by those who attended him.

Have you occasion to know if Principal Robertson used to express himself to the same purpose?—Very much in the same way; and his colleague, Dr. Erskine, who attended the class at the same time.

Was that taught in a great measure by examination?—Really, I do not recollect that circumstance. I was once acquainted with it, but I have forgotten so much of the subject, that I cannot speak correctly on it.

The Reverend *John Inglis*, D.D., called in and examined.

Rev. Dr. J. Inglis.

The Commissioners are desirous of possessing your opinion with respect to the Discipline and Education in this University, and of hearing any suggestion you may have to offer in the way of improvement?—In consequence of a letter which I have received from the Commission, I have given the matter consideration. It has always appeared to me that in this University there is too much trusted to public lectures. I think that, in order to the profit of the young men, it is very important that they should be made to write more Essays upon the subjects which they are studying; and also, that they should be much more frequently examined. When I speak of their being examined, I do not refer to examinations upon the subjects of the lectures merely; I think they should be frequently examined upon the subject of the books which they have been directed to read; and I conceive that by this means the necessity of a very large course of lectures might be, in a great measure, superseded. A few lectures, comparatively, might serve; they might bear reference to the books which the students were directed to read; and the Professor might decline to enter into any lengthened discussion on the subjects which are well treated in those books. But I am aware that, in order to carry on any such scheme with practical effect, there may be difficulties to surmount. The Professor, according to the present system, may find it very difficult to prevail on his students to write the requisite number of Essays, and to submit to the requisite examinations; they may absent themselves at the hours of examination, and at present, perhaps, it is not easy to find any means of compulsion; for there are a considerable number of students attending the classes of general Literature and Science in this University who would not choose to be placed quite on the footing of boys, so as to be *forced* to do anything; and it would be disagreeable to compel them. But it has occurred to me, that the difficulty might be surmounted by dividing the whole number of students into two classes—the *Ordinary* and the *Extraordinary*. The ordinary class of students should be obliged to write all the Essays prescribed, and to read all the books pointed out, and to submit to examinations upon the subject of them all; in return for which, they alone should have any right to University privileges,—such as being enrolled as students of Divinity, and qualified to be received as Masters of Arts, or to have any Academical degree. I mean to apply these observations to the classes of general Literature and Science, and also to those of Theology, without any reference to the Law or Medical departments. But, in regard to the Theological department, it occurs to me that there are some other circumstances that call for particular attention. We have two Professors of Divinity in this College, but to the first Professor (Dr. Ritchie) the labour is too great, and the time that would be required for its performance, is more than the students can well afford. I believe that at present the first Professor of Divinity can scarcely find time to deliver any lectures, on account of the time which is exhausted by hearing the discourses that are prescribed to the students, and which must be delivered before they can be received upon probationary trials. Now, in order to give him some time for a few lectures, and much more time (which I should suppose to be requisite) for the examination of his students, I think it indispensable that a

University of Edinburgh.

Rev. Dr. J. Inglis.

13 November 1826.

separate hour for hearing discourses should be provided for him. I do not say whether the attendance of all the students at that hour should be held as imperative. It would certainly be very desirable that they should profit by the Professor's criticisms on the discourses of their fellows; but still I would rather make their attendance discretionary at that hour than I would lose the advantage which the Professor would have of getting more time to do his whole duty. There is another way, perhaps, in which the first Professor of Divinity might have the number of discourses that he should hear, abridged. The Professor of Church History, who is also, by his patent, a Professor of Divinity, does prescribe discourses; but it is not absolutely required of the students that they should write or deliver them. If it were made indispensable that the discourses prescribed by the Professor of Church History (and they are not confined to Church History alone, but extend to every branch of Theological Science)—if it were made imperative that these discourses should be written and delivered, perhaps fewer discourses might be required from the students in the Divinity Hall, where they are under the more immediate inspection of the first Professor of Divinity.

Would you propose that the discourses in the class of Church History should count along with those delivered by the students in the class of Divinity?—I think so.

Could that be done without a rule of the Church?—I apprehend it could not; but I do not pretend to say what the rights of the Church are, or what the rights of the Crown may be, or the rights of those who act for the Crown; but I believe that, practically speaking, it would be found impossible to introduce any alteration, without the concurrence of the General Assembly of the Church, and for this plain reason—that the Church alone has the power of licensing Probationers. They may give their licence to whom they choose, and refuse it to those whom they do not choose.

Would it be desirable then to have the sanction of the Church?—Yes.

Do you think there is any objection to requiring moderate fees from the students of Divinity?—The whole expense of the education of a young man for our Church is very great, in proportion to the worldly object that is proposed to him in his acquisition of a living or a parish church. Churchmen, therefore, proceed upon the principle, that it is essential to keep the expense moderate; but I have known cases in which it has turned out, that a class was better attended in consequence of a small fee being required than when the students were allowed to go without any fee; I hold the question to be well entitled to consideration.

Are there not five discourses required of every student of Divinity before he is taken into the Church?—Yes, there are.

Would you propose that, in the event of exacting some discourses from those who attend the Ecclesiastical History class, the number of five discourses, upon the whole, should be increased, or should that number of five comprehend all the discourses required, both in the Divinity Hall and in the class of Ecclesiastical History?—I do not think it would be very necessary to increase the whole number; but say that, in place of five, three were required by the Professor of Church History, and three by the first Professor of Divinity, it would diminish very considerably the time which is now occupied by the Professor who alone receives discourses; it would diminish the time by two-fifths.

Do the five discourses which are now required relate to Systematic Divinity?—There are two of them which are a sort of technical discourses; one is in Latin, upon a given Thesis in Divinity; the other is a Critical Discourse upon a passage of Scripture, in which the person who writes it begins with analyzing the Greek text. It next removes textual difficulties, if there be any; then he sums up the meaning of the whole passage in a paraphrase; and lastly, states such doctrinal propositions as the text contains, or as may be fairly deduced from it, and illustrates one or more of them. The other three discourses are—first, a Homily, which in practice is not materially distinguished from an ordinary sermon, but ought to be distinguished by its being a more scientific discourse (if I may employ that term), or a discourse of investigation and argument, rather than one of a popular cast. The other two are a Lecture and a Popular Sermon.

Do you think that any of these could be dispensed with advantageously?—I think the two discourses, which I mentioned first, are the least important, but particularly the Latin discourse; the principal value of it I understand to be as a specimen (at least it is intended to be such) of the young man's Latinity, or his capacity for writing Latin; but I believe, in that respect, it is often illusory; I fear that, in many cases, the young man does not write the Latin, and there is no way of compelling him.

Supposing it were possible to secure the writing of it by himself, would it not be a most valuable exercise?—Certainly.

What do you say with respect to that which you call the Homily; as there is a popular sermon follows, could that be omitted without impropriety?—If the Homily were written with a due regard to the original design of it, I think it would turn out a very necessary and proper discourse, as affording a specimen of the young man's talent for scientific investigation (I speak of Theology as a science at present), and it would be that sort of production that might be expected from a learned and well informed man, different somewhat from what is necessary in addressing a common audience.

From what you have just stated, are the Commissioners to understand it as your opinion that the original design is not followed out frequently?—I think it is not.

Is it not possible to have regulations, by which that design might be implicitly followed?—It would be difficult so to characterize the kind of discourse, as to be able, from laying down the law respecting it, to say that a particular discourse which is given does not conform to the design.

Are there not discourses prescribed by the law of the Church, to be delivered before the

University of Edinburgh.

Rev. Dr. J. Inglis.

13 November 1826.

Presbytery?—Certainly; the discourses are required again when the young man comes before the Presbytery, upon probationary trials for a licence.

Might not the individual coming before the Presbytery produce exactly, *verbatim*, the same discourses that he wrote antecedently?—I believe that, in fact, he very often does; and, in reference to the exercises which are prescribed in Latin and Greek, many Presbyteries practically mean to indulge the student; they do not consider them of so much importance as to oblige him to repeat his labour, but allow him quietly to suggest to the Presbytery clerk the subject on which he would wish the discourse to be prescribed.

If the Presbytery discovered that they were actually the same discourses, would any objection be made?—No, I never heard of it; but there are always new subjects prescribed for the Lecture, the Homily, and the popular Sermon.

Does not Dr. Inglis conceive that the two exercises, with reference to which indulgence seems to be given in the Presbyteries of this Church, are most important, provided it could be ensured that they were the composition of the candidate himself—the one with reference to his knowledge of the Latin language, and the other with reference to his powers of Biblical criticism and reasoning?—The Exegesis would be important as a trial of the young man's knowledge of the Latin language. As to the Exercise and Addition I am not very sure; for a very small proportion of knowledge of the Greek language is necessary for his accomplishing the Analysis, with one of the ordinary books for his assistance; and in regard to the other three parts of the discourse,—the removing of textual difficulties, the paraphrase, and the deducing of doctrinal propositions,—it is more a mechanical process than anything else. I do not conceive that discourse to be practically of great value; but there is no doubt, at the same time, that a man of superior talent may manifest his superiority very decidedly in the composition of that discourse.

In the event of the duty of hearing these discourses being divided between the Professor of Divinity and the Professor of Ecclesiastical History, would it not, in your opinion, be expedient that provision should be made that the Professor of Ecclesiastical History should not give out all his subjects as merely historical?—Clearly; and, in point of fact, he does not. The present Professor of Ecclesiastical History is appointed as a second Professor of Divinity, with a particular view or reference to Ecclesiastical History; and I know he holds himself, upon that ground, entitled to teach his students everything that is connected with Theological Science, but not by any means to the neglect of the historical department.

Is it your opinion that lectures upon Biblical criticism would be of advantage, to be delivered by one or other of the Professors?—I think so; and they were not unknown when I was a student of Divinity; but they were not frequent.

Who lectured upon them at the period you studied?—Professor Hamilton, when I at first became a student of Divinity.

What was his Professorship?—He was first Professor of Divinity; and he lectured occasionally upon Biblical criticism.

Supposing it were assigned to the Principal, or to a distinct Professor, would it not be a useful and an appropriate part of the course of study for Theological students?—It would certainly; but it must be remembered that it might be going a great deal too far with regard to the time of the students. In our country the students of Divinity have a very expensive education from the length of it. They are in general not wealthy; they find it absolutely necessary, therefore, to support the expense of their education by teaching; and it is for that reason chiefly, I presume, that the Church has always allowed a certain length of time for the study to supersede close attendance upon the Divinity Hall, or upon any lectures. A large proportion of the students of Divinity could not go on at all, if they were either required to give all their time to the various branches of their study, or to give close attendance at the College.

Do you know if, at present, by the regulations which are about to take effect, attendance for one year at the Divinity Hall, with irregular attendance for four or five years, is reckoned sufficient?—Yes; one year of regular, with four of occasional attendance.

May not that occasional attendance be only for one day or one hour in each session?—There is nothing specified with regard to length of time.

Are you of opinion that regular attendance for one year is, for the interests of the Church and of Literature, sufficient to secure a competent knowledge of Theology, with such attainments as the young men in general in the country have it in their power to acquire away from books and other aids of that description?—I am not aware that we have practically found much inconvenience from it. I believe some of the most respectable clergymen in the Church have been what are called irregular students; and it does appear to me (though there would certainly be an advantage gained to the students, and consequently gained to the Church by their superior qualifications), that, by requiring more, there would be an accompanying inconvenience, which would more than counterbalance the other advantages. For instance, if it were required that there should be a regular attendance (say for three years), it would put off, I am afraid too long, because longer than most of the students could afford, the period when they could have it in their power to become tutors in the families of noblemen and gentlemen, living at a distance from a University; and if these noblemen and gentlemen could not get students, who had a view to the Church, to be tutors in their families, they would take students who were connected with the dissenting interest, rather than want private tutors; and in that way more might be done than would be at once apprehended, to create a sort of alienation of mind from the Church, and connect the great families with the dissenting interest. But, besides this, a considerable portion of our students of Divinity, who live in Edinburgh, cannot regularly attend the Divinity Hall; and if it were required that there should be three, or four, or five

413

University of Edinburgh.

Rev. Dr. J. Inglis.

13 November 1826.

hours of attendance, instead of two, it would put regular attendance out of the power of a greater number. Some of those who at present cannot attend, are persons who are employed as Teachers in the Charitable Institutions,—for instance, there are two or three such in Heriot's Hospital, and perhaps an equal number in Watson's; there are other hospitals getting up at present which will very probably have Students of Divinity for teachers. These young men could not attend many hours at the Divinity Hall; they would not have leave from the Governors of the Institutions to do so; and they would cease to be students of Divinity altogether, if the possibility of occasional attendance were cut off.

Have you not, at present, a much larger proportion of students of Divinity than the Church requires?—Yes.

Do you think any alterations, such as are now alluded to, would have the effect of reducing that number below what the Church would require?—Though we certainly have a greater number than is requisite to supply the vacancies of the Church, I believe, upon the whole, we get the best of them; I do not say we get all the best, but upon an average we do; and, if the number were reduced, I believe we should not be so well provided.

In reducing the number, in consequence of such regulations as are proposed, by which the students would be rendered a superior order, would not the Church gain by that method, in the one point of view, as much as they would lose by the reduction of the numbers?—It is not easy to answer the question;—there are a considerable number of students of Divinity at present who go off to other professions, particularly to the Medical profession. They study Divinity and Medicine at the same time, and, when they find they are not likely to get Churches, they become Surgeons in the country.

From your knowledge and observation of the state of the Church, would you say, upon the whole, that those young men who enter the Church, and whose circumstances might prevent them, in your opinion, from giving regular attendance upon a full course of Divinity (say for three years), are as useful as those whose circumstances would render it less oppressive to be obliged to do so?—I believe that of those young men who would find it very hard to give regular attendance for three years, after having given four or five years' attendance upon the classes of general literature (particularly the sons of clergymen), there are no inconsiderable number who rank among the best qualified. The sons of clergymen have an advantage, in studying under their fathers; and, unless they are fortunate enough to get employment as Teachers in the city where the University is situated, their fathers cannot be at the expense of keeping them there for so long a time, merely for the purpose of study.

Do you find a very valuable and useful part of the Scotch Clergy, in point of fact, come from a much lower class of society than that to which you have now alluded?—Yes, I do; but in what proportion I cannot exactly say: I think that, in proportion to the whole number, there are more of the sons of clergymen eminently qualified, than there are from any other class.

At what time, in general, do you suppose that clergymen, who have the same extensive acquaintance as you have with young men, are in the habit of recommending students as Tutors?—They would be very willingly taken, I believe, by the families to whom they are recommended, at an earlier period of their study, than they can be found. When a gentleman wants a tutor for his son, he lays his account, very commonly (if the young man shall acquit himself to his satisfaction), to provide him with a living in the Church ultimately; he would therefore rather take a man who was not qualified to accept a presentation for several years, than one already a preacher, who would be staring him in the face for assistance immediately.

In that way, then, do you find no indisposition to take young men, younger than they are fit for the Church?—They are taken as young as they can be spared from their studies.

Does not that practice, in point of fact, tend to make the studies of these young men too short?—It is just one of the great reasons why occasional or irregular attendance has been thought, by the General Assembly, to be necessary; it is an evil they must submit to.

But that is admitting it always to be an evil?—Undoubtedly; if, without incurring other inconvenience, matters could be so regulated that the students of Divinity should remain close at their studies here, without teaching, I would hold that to be an advantage, and no man can doubt it.

Is it common for students to enter the Divinity Hall about the age of 17 or 18?—It is not so common as it was. I think the young men do not come to the College so early as they did about 30 or 40 years ago. I know that I went to College myself at the age of 13; and I know that the last son I put to College was 15 before I sent him. The school education is better conducted now than it used to be long ago, and a longer time is allowed for it.

How long have those regulations existed, by which occasional attendance has been permitted?—I suppose from the beginning: so far as I know, there was never any other system in our Church. The Overture, which received the sanction of the Presbyteries last year, and which makes one year of regular attendance indispensable, I believe is the first case in which the whole object of students might not be gained by occasional attendance.

From your actual observation, experience, or reading, are you able to state, whether the effect of the system of irregular attendance has been observed upon the Literary or Theological character of the members of the Church?—No; I cannot say that the effect has been manifest to my view. I have not made the distinction which would be necessary to such a conclusion. I find that I have two short notes here, of subjects which I ought to mention. I think the Rhetoric class ought to be made indispensable to students of Divinity. It is more important to them than the Mathematical class, attendance upon which is at present indispensable. I also think it is very unprofitable to many of the students to attend the Logic class during their second session. Yet they are strongly tempted to do so, because they cannot otherwise

University of Edinburgh.

Rev. Dr. J. Inglis.

13 November 1826.

complete their course in four years. I should think, for my own part, that a boy coming from a provincial school, with that very meagre knowledge of Greek and Latin which he generally has, cannot, in the first year, make such additional progress in Greek and Latin as to be at all in a condition, during the second year, to attend, besides them, both Logic and Mathematics, as they generally do. I am convinced, that the circumstance of their having more than enough to do during the second year, and their being in consequence overpowered, makes them give up labouring altogether. I know, when I was myself a boy, I perceived repeated instances of boys becoming perfectly desperate, during the second year, from having too much to do. Now, by the present arrangements, the student who attends the Logic class, cannot, during the same year, attend the Moral Philosophy class; nor can the student who attends that class, attend the Natural Philosophy during the same year. For my own part, I would rather that, during the last two years, it were put in the power of the young men to attend these three classes of Intellectual and Physical Science, than that they should be obliged or induced to attend the Logic class during the second year.

With reference to the course of previous study, to which you have been now adverting, for students of Divinity as well as for others, would you have the goodness to offer to the Commissioners your opinion upon the propriety or practicability (with reference to the state of the schools, and the means which young men have, in general, of prosecuting the study of Greek in the country) of abolishing the Elementary Class for Greek in the College?—I believe that there is a progress making towards such a state of things as may admit of that; but I have considerable doubt of its being so far advanced hitherto as to admit of it. The boys who are educated at the High School of Edinburgh, and some of the other best schools in the country, are not in want of an Elementary Greek Class at College, and few of them go to it; but I am afraid that you would cut off from some boys in the country the opportunity of coming to the College at all, if you did not allow them to commence their study of Greek in whatever University they may repair to.

Do you think the Parochial Schools afford a sufficient knowledge of Greek?—They do not.

Of the students of Divinity, who come from the country to Edinburgh, do you suppose that there is any very considerable proportion who have a sufficient knowledge of Greek before they come here, so as to enable them to enter the second class?—I am afraid, not many; I should think, very few. The students of Divinity are either clergymen's sons, or they are, ordinarily, persons coming from an inferior condition in life. Certainly, there are more of them bred in ordinary parish schools than there are of the other students at College; and I doubt much if there be one parish school out of fifty in which the boy has an opportunity of learning as much Greek as to supersede the Elementary Class.

Of late, has more attention been paid in requiring Greek as a qualification for country schoolmasters than formerly?—Perhaps so; but I have not heard much of it.

Do you think that the progress which is making, to which you have alluded, by which the junior class of Greek might be dispensed with in this University, would be accelerated, if it were now settled that, in a certain period of years, that abolition should take place; during which period the schools in the country might, by that means, be improved?—It must depend upon Parliamentary provisions, in regard to the appointment of schoolmasters. I do not recollect very exactly how the matter stands at present; but I rather lean to the opinion, that the heritors are allowed to fix or to specify the branches of knowledge upon which the candidate for the school is to be examined. The Presbytery are the examinators, and the heritors specify the branches of knowledge. To accomplish the object, it would be necessary that the Legislature should specify the branches, and make them imperative.

Do you think that, if there were an arrangement with the High School here, those young men who come from a distance to enter the University, might not be enabled to take an elementary education in Greek the first year, without having it in the University, at the same expense, or less?—It would be an anomalous sort of procedure to have them scholars at the High School and at the same time students at the College; and, though I do not see any absolute inconsistency, I am not quite aware, at the moment, that there would be any greater inconvenience than we have at present from an Elementary Branch in the College.

Do you think that it would be a great improvement in education, if, by any regulation of the Legislature, or other competent authority, a system of instruction should be given, in the schools thoughout the country, by which it would then be unnecessary to have the elementary knowledge of Greek, for instance, taught in the University?—Clearly; and I think it is by no means impracticable. I think, a little more than has been done for ensuring to the parishes respectable schoolmasters, and a legislative provision relative to the branches of education upon which they should be examined by the Presbytery, would, in the course of no long period, secure the accomplishment of that object.

Would not the accomplishment of such an object, if it could be effected, be of very great advantage to education in the University, by not bringing boys so very early there for the purpose of learning elementary knowledge?—Certainly; it is an awkward thing that a boy should come to College to learn the very first elements of the Greek language.

Does Dr. Inglis think that there would be any very considerable difficulty in providing the common Parochial Schools of Scotland with a class of men who are of sufficient knowledge in Greek learning, taking into consideration how slender the provision must always be, and how small the encouragement is for such persons?—If I take into my view the exact state of the provision as it now stands, I should say it is too slender for the purpose, and an obstacle to the attainment of the object; but a very moderate improvement in the condition of the Parish Schoolmasters would admit of its accomplishment. There are a great many young men in the course of being bred to the Church, who soon find out that they cannot accomplish their

University of Edinburgh.

Rev. Dr. J. Inglis.

13 November 1826.

object in reference to the Church; and they would be very well contented to sit down with the situation of Parish Schoolmasters, if the provision were a little better than it is at present.

Might not the object in view be accomplished, in a great measure, supposing good schools were to be established in borough towns and considerable parishes in the country?—Yes, certainly it might, but not so well as by making the improvement universal. For instance, I should think it exceedingly hard towards my professional brethren, the Clergy, in the event of the improvement being attempted at all, if it were not made universal; and if a parish minister, in a remote part of the country, were not to have it in his power to get his sons educated at home in the degree that was necessary for their going to the University. Every man is not equally gifted with the faculty of teaching; and some parish ministers may either have a constitutional dislike to it, or may find that their other duties press too heavily on them to admit of their taking charge of the education of their sons. If, in this case, the parish schoolmaster were not qualified to teach what would qualify them for the University, it would be a great hardship.

Would not the expense of any such improvement in the condition of the Parochial Schoolmasters be borne by the landed interest?—I know no other way; perhaps there might be something done in the way of improving the school fees.

Are you aware that a very great opposition was made, a year or two ago, to a proposed bill upon that subject all over Scotland?—I heard of an opposition; but if the country were aware that there was a great object in view in reference to the system of education at the Universities, perhaps it might soften the opposition.

Are you not aware that an evil has arisen in some parts of the country from the children of the poorer classes not having their education so well attended to as formerly, in consequence of schoolmasters teaching the higher branches, and directing their attention to a higher order of scholars?—I have not heard of it.

Do you not apprehend that, if the schoolmasters in general were to become a better sort of teachers, and were to direct their attention more to Greek and Latin, the children of the poorer classes would be less attended to by these schoolmasters?—I cannot say: it might have that effect; but I should not much apprehend it. I think, so far as I have practically known, that those schoolmasters who were in all respects the best qualified, have been most useful to the scholars of every class.

Supposing the Parochial Schools were left in the condition in which they now are, are you of opinion that, if a regulation were made by which the junior class of Greek was superseded gradually in the Universities of Scotland, schools to take their place would soon arise in the larger towns throughout the country?—Yes; I think in larger towns they would arise, but I do not think that these would be sufficient.

Do you think they would arise in sufficient number to fill up the want that might be occasioned by the University Class being suppressed?—No.

Are you aware of the fact, that during the last ten or fifteen years, since greater attention has been paid to the teaching of Greek in the High School, and in all other principal Schools and Academies throughout the country, the number of the junior Greek class in this College has proportionally very much increased?—I was not aware of the fact, and am surprised to hear it, as there are a considerable number who go directly to the senior class.

The fact being reported to the Commissioners to be so, that the proportion of those who enter the Greek class, for the purpose of learning the elements of that language, has in reality increased greatly during the period when greater attention has been given in the schools to the teaching of Greek, can you state any causes to which you would be inclined to ascribe that result?—One of the conclusions I would derive from the fact is, that there must be a greater number of students who are now satisfied with having acquired the elements of the language without prosecuting the study further; but that is only an additional fact which remains to be accounted for.

Are you aware that the first Humanity class is taught at the same hour with the second Greek class, so that a boy cannot get the benefit of the first Humanity class, and at the same time enter the second Greek class?—I am not aware of the fact; but I do not see how it should operate strongly—for this reason, that a boy who is not qualified for the senior Humanity class, is not likely to be qualified for the senior Greek class; there are more boys from schools that are qualified for the senior Latin than for the senior Greek class.

Supposing the fact to be, that a great proportion of the young men who leave the High School, and those other classes where Greek has lately been carried further than previously, pass over the first Greek, and go to the second, and yet that the number of the junior Greek class has very much increased; are you aware of any circumstances to which you would be inclined to ascribe that?—No, I am not aware of anything to which I can ascribe it.

You gave your opinion, that in general there should be more Exercises prescribed in the whole system of education; do you think that those five discourses which are absolutely required for the Church, are a sufficient number of exercises during the whole of the academical study of Theology?—They are quite enough, if the Professor of Church History were enabled to enforce the writing of discourses which he prescribes; but he is not enabled to do so at present. The improvement which I conceive to be desirable in the system of Theological education, does not consist in increasing so much the number of Exercises as the frequency of Examinations. Examinations I believe to have been unknown in the Divinity Hall for a considerable time. When I was a student of Divinity, at least during the latter part of my course, Dr. Hunter, the Professor, did examine, and I am certain he did us good by it; but one department of examination to which I have referred, I never knew realized, either here or elsewhere; I do not mean examining upon the subject of the lectures delivered, but examining upon the books prescribed to be read, and which every student should be understood to have read.

University of Edinburgh.

Rev. Dr. J. Inglis.

13 November 1826.

Are you aware that that plan has been followed by Principal Haldane at St. Andrews?—I was not aware of it, but I am happy to hear it.

Supposing the Exercises which are prescribed and delivered in, were not delivered as discourses, but were delivered to the Professor, would not a good deal of time be saved, and a good deal more exercise be carried on?—A good deal of time would be saved to the students in respect to their hearing those discourses delivered; but no time would be saved to the Professor; for he must read them, and he must write down his remarks, which would cost a little more time than to give his opinion *vivâ voce*.

What do you think is the best method of ascertaining the proportion of regular and irregular students?—It is not very easy to be done, with reference to one view of the case, unless the Professor of Divinity take very considerable trouble in making out lists. He may probably know at once, by looking into his present lists, how many students he has had, and how many for the year may have given regular attendance; but a proportion of those students who have not given regular attendance for the year, are notwithstanding completely regular in the eye of the law. It has been the rule for the last twenty years, that three years' attendance, and one year of additional enrolment without attendance, constitute a regular student in the view of the Church; and, consequently, if it is wanted to be known what proportion of the students have been regular in the eye of the Ecclesiastical Law, it will require some more particular lists to be kept.

Do you consider that there is any objection to making it imperative that the Professor of Divinity should have two hours a-day—one for Lecturing, and the other for Examination or Discourses?—I really believe it to be essential; yet, I will not say that there may not be some inconveniences resulting from it to a certain portion of the students, if attendance at the second hour is made indispensable. At present, I believe, Dr. Ritchie thinks himself entitled to two hours if he chooses to exact them, and he does ordinarily exact an hour and a half.

Do you think the inconvenience that might arise to a certain portion of the students, sufficient to counterbalance the general convenience?—I lean to the opinion that two hours ought to be required, but not so much with a view to many lectures, as with a view to frequent examinations on the books which have been read.

Are you aware if an Overture, with that view, has been brought before the General Assembly from the Presbytery of Aberdeen?—No, I am not.

Edinburgh, Wednesday, 15*th November* 1826.

The Right Honourable LORD BINNING in the Chair.

The Reverend *Andrew Thomson,* D.D., called in and examined.

Rev. Dr. A. Thomson.

15 November 1826.

Are you Minister of St. George's Church, in this City?—Yes, I am.

Have you turned your attention to the general subject of the state of this University, and particularly to its Constitution, its Discipline, and Education?—I have paid some attention to it, both in consequence of being educated in the University of Edinburgh, and from the interest I take in all seminaries of education.

Are there any suggestions which you have to offer as to what you think might be done for its improvement?—I took the liberty of noting down a few things which I intended to mention to the Commissioners. There is one suggestion I would beg leave to make, which I think of great importance. I think there should be a great deal more examination in the classes than what I was accustomed to observe when I was there, and more than exists at present, as I happen to know. I mean the examination of students, as to their particular subjects of study, and as to the use they make of the lectures which they hear from the Professors. Connected with that, I would suggest the propriety and the necessity of the students being obliged to give more Exercises upon the various subjects with which they are occupied, as affording a stimulus to their minds, leading them to make more thorough inquiry into what they are studying, and giving them greater correctness of thinking and reasoning, as well as accustoming them more to composition.

Would you propose to make all such Examinations imperative on all the students?—Unquestionably; especially in the younger classes. There are some of the higher classes about which I should be doubtful as to the expediency of compelling them all to attend; but even there I think they should have the opportunity. I am quite sure a great proportion of them would submit to examination.

With regard to that portion of students who aspire to Academical honours, would you think it right to require of them that they should submit to that system of instruction?—Surely; if it is with regard to getting a degree, unquestionably it should be imperative. In no case should they get the degree of Master of Arts without examination; and I should think it necessary to have the examination very strict and quite public.

Would you not think it necessary to require of all such as are aspiring to Academical honours, that they should submit to examinations in the previous classes?—Yes; I certainly should think so. I should think that this would have an excellent effect upon their ambition and their exertions from the earliest period, if it were continually before them.

When you state a doubt as to the propriety of introducing an examination into the higher classes, which do you mean?—I mean such classes as those of Medicine; though even in these I do not say positively that the plan would be either impracticable or useless; but I think it might be adopted, and made peremptory on all those that we call the Philosophical classes—meaning by that the classes for Languages, Mathematics, Logic, Moral Philosophy, and Natural Philosophy.

Are you of opinion that it is necessary that additional hours should be required for the pur-

University of Edinburgh.

Rev. Dr. A. Thomson.

15 November 1826.

pose of examination?—Certainly; I am of opinion there is too little time bestowed upon teaching, taking the term generally, as including lecturing, exercises, and examination.

Do you think the present quantity of lecturing sufficient, if it were accompanied with the corresponding examination at separate hours?—Yes, I think that would do.

Are the Commissioners to collect it as your opinion, that the system of conveying instruction to very young men, merely by lecturing, when not accompanied with the system of examination, is not a very beneficial or advantageous mode of conducting education in a University?—I am decidedly of that opinion.

As to Examinations, do you think it desirable that young men should be examined before entering into the higher classes, with regard to the progress they have made in the junior classes; for instance, that no one should be suffered to enter the Natural Philosophy class, with a view to a degree, without being sufficiently acquainted with Mathematics?—I should think that very expedient; for they cannot derive benefit from the Natural Philosophy class, unless they are competently acquainted with Mathematics. The one is not merely a preparation, but a necessary preparation for the other, in order to derive adequate or full benefit from it. At the same time, I think it is, perhaps, somewhat difficult to determine the precise quantity of Mathematical knowledge a student ought to have in order to enter the Natural Philosophy class. I think there would be a great difficulty in following out a view of that kind with every desirable degree of accuracy.

Do you think it would be trusting rather too much to the Examinators?—Yes.

Would you rely upon certificates, or would you allow the students to enter indiscriminately, whether they were prepared or not?—The idea I have is this, that, if the Mathematical classes are properly taught, there is secured a very considerable degree of preparation; but I should think it would be a matter of considerable difficulty to decide upon this point, whether those young men ought or ought not to be allowed to enter the Natural Philosophy class, because they have or have not a certain quantity of Mathematical knowledge. There are many young men who have not a very great turn for Mathematical science, but who might derive a great deal of benefit from what they collect in the Mathematical class, or in the Natural Philosophy class; and it would be hard to prevent these from going forward to studies in which they might be qualified to shine and prove eminently useful.

Would it not be safe to require a certificate of attendance the first year upon the Mathematical class?—If it were practicable, I should greatly prefer the mode of examination; for, from my experience, I have learned not to put great confidence in certificates.

Would you conceive that a young man would be likely to derive much benefit from the class of Rhetoric or Logic, without previously having made considerable proficiency in classical learning?—Certainly not. In some respects he might derive a good deal of advantage, but not advantage corresponding with a view to a learned profession, or to such an education as people of standing and influence in the country would wish their children to have.

Have you access to know, if there is more or less examination in the junior classes now than when you attended College?—I am afraid, from what I have seen, that there is less; and I speak from having had experience lately—indeed for many years—in examining young men who have come from College, with a view to granting them bursaries from Heriot's Hospital, to assist them in continuing their studies.

Can you state the result of that examination so as to say whether they seemed to have made much progress?—I am very sorry to say, the exhibition was most mortifying.

Do you mean to say that they had made little progress since leaving Heriot's Hospital?—In some cases there was the appearance of the very contrary of progress.

How long had these young men been attending the junior classes of the College?—Just on Tuesday last, there was one of them who had been attending three sessions; I must say that he appeared very lame indeed. I think, from my recollection of having examined him before, he was a worse scholar than he had been two years ago.

Did that proceed from his not having had fair justice done to him, or from any natural incapacity for learning in the boy himself?—From the account which I got of him, I believe him to have been a very industrious boy. I do not think his capacity was very great. The truth was, he had not had sufficient stimulus, from the account he gave. We asked him questions, as to the number of times he was called up, and the attention which was paid to him.

Do you happen to recollect the number of times he was called up?—There were several whom we examined; and we put those questions to them, from taking a deep interest in their welfare, that we might do justice to the institution which supports them; and in no case had any of them been called up above once a-fortnight; in some cases, they had been called up once in three weeks; in other cases, some of them had not been called up above once a-month; and in one case, the lad had not been called up at all: but that was their own account of it.

Have you ever had any of your own family at this College?—Yes, I had a son who attended College.

Did the general result of your private experience lead you to form the same conclusion?—Yes.

Was that with respect to the junior classes generally?—Yes.

Would you, from these facts, be led to infer that, according to the objects and constitution of these classes, young men go too early to College, and that the system of instruction in the University is not well adapted for conveying elementary knowledge to young people in the Literary classes?—I do not think that, in general, they go too young. I am quite satisfied about that. But I do not think they get all the advantages that might be given them in the way of examination.

Do you think the young persons to whom you refer had had fewer opportunities of being

University of Edinburgh.

Rev. Dr. A. Thomson.

15 November 1826.

sufficiently prepared for College than the generality of young men who come here?—Quite the contrary. Those that I referred to particularly, were bred in Heriot's Hospital, where they had an excellent classical education.

Is it your opinion that they were better or worse prepared for College than other young men who were sent?—Better.

Were they young men who had obtained the prizes at Heriot's Hospital, or who were selected on account of their previous attainments and industry?—They were. We are not allowed to send any to College but those whom we think hopeful scholars; we regularly examine them. We have 180 boys, and all of them have the advantage of getting a classical education, so that the selection is from that number.

Are there not other bursaries given by Heriot's Hospital besides these?—Yes; we give about ten to boys who are not brought up in the Hospital.

Are those boys examined?—They are examined previously to our bestowing the bursaries on them. We examine them again before renewing their bursary for the next year; and, if they do not seem to be making progress, we withhold the bursaries.

With regard to what you alluded to just now, have you observed the same thing with regard to those boys out of the house as those who have been educated in the house?—Yes: they have not made progress.

Do you understand that the classes you allude to are more numerous now than they were when you were at College?—Yes, they are.

If no more time is bestowed, must there not be less opportunity to examine the class?—In some degree that must be the case; but there was a mode of examining adopted in my time, which put it in the power of the Professor to make his pupils all alive to the business of the class. It was not so much the instruction directly communicated in the class, as the keeping of their attention awake, stimulating them to industry, and not letting them think that they could escape examination at any time. When I was at College, the plan adopted was this—the Professor, for instance, called me up to read a sentence: I read the sentence, and translated it: then he began to examine me upon the construction, and the parts of speech; but while he kept me standing five minutes, perhaps, with that, he would have asked questions, probably, of ten or twelve others, in different parts of the class, connected with my examination. A great deal may be done in that way.

Do you understand that that plan is a little departed from here?—From the information of these young men I do. There is another suggestion I would beg leave to make, which is, that more attention should be paid for securing and ascertaining the attendance of the students.

Have any means occurred to you by which that object might be accomplished?—Why, the calling of a roll is rather tedious; but, if it were done a certain number of times a-week, it would, at least, remedy the evil in a great measure.

Would you have it so arranged that no young man could ever tell when it was to be done?—Yes. Our Church law requires that, before a student can be enrolled as a Student of Divinity, he must have attended a full course of Philosophy; which full course is, I believe, regulated by the Senatus Academicus. We do not interfere with that. There are certain classes that he must attend, and he must bring certificates of attendance to the Professor of Divinity. There was a case I know lately, in which a gentleman, who is now a minister of the Church, who taught a school in the country, came at the beginning of a session, enrolled, paid his fee, got his ticket, walked home, and taught his school the whole winter. Then he came back, and got his certificate of regular attendance. The next session he repeated that mode of proceeding, which was a most unworthy one on his part, and did the same thing with another class. Then, with his two certificates of attendance, he went to the Professor of Divinity, who could not possibly know the imposition that was practised on him. Thus he got the privilege of enrolling as a student of Divinity, though he had not attended either of those two classes which, by the law, he was bound to do.

Then he was not examined on the matter of those classes by the Professor of Divinity or any other?—No; I mentioned it to Dr. David Ritchie, Professor of Logic, and he said he had known instances of the same kind, which led him to look more strictly to the attendance of the students in his own class.

Though there would be a loss of time in calling a catalogue, do you not think that the advantages arising from it would counterbalance that loss of time?—Though there would be a little loss of time, the advantages would be immense. It might be done by having a censor in every two or three seats; and though the young men attending the Moral and Natural Philosophy class, if they were to come in at present, and find such an arrangement, might think it beneath their dignity to be made censors, yet, if that plan were adopted, and they were accustomed to it from the beginning, they would do it cheerfully, and think nothing of it. Another consideration is, that, if the Professor were accustomed to examine, and to give Exercises, he could ascertain absence with a glance of his eye almost, and come to know his pupils individually. This would be a material check upon non-attendance. There is another suggestion which has occurred to me, and which I have long considered as of importance, with regard to many of these higher classes: it is this, that if the Professors adopted the plan of rather guiding the studies of the young men under their care, than attempting to give full discussions upon every topic, their pupils would derive a great deal more improvement from the course. I think it more material with regard to the Divinity classes, from the vastness of the subject; but, even as regards the Philosophical classes, I think it has been too little attended to. From the plan of giving copious dissertations upon particular points, a great many must be left out of view altogether, or be but very slightly handled; whereas, if they would give a discourse only now and then upon points which are of fundamental importance, or upon which they thought they could throw new light, but were in general to guide the studies

419

University of Edinburgh.

Rev. Dr. A. Thomson.

15 November 1826.

of young men, tell them where to get more particular information, direct them to treatises written upon the different subjects, and give them some account of these, that they might read them in the safest and most profitable way: this would be a very material advantage, and be infinitely more beneficial to the students.

With reference to the method of pursuing that plan advantageously, would you propose that the examinations should take place at a separate hour, and, in part, turn on the subject of those studies so recommended to the young men?—Undoubtedly.

But you would certainly not propose, that, in consequence of that, the Professor,—say of Natural Philosophy,—should not give a complete system of instruction?—There are some classes where, from the nature of the subject, it must be given in detail; for example, Chemistry and Natural Philosophy. In some of these the Professors must go through the details, otherwise they cannot give a proper view of the subject at all: but I was speaking of those classes where there was no demonstration and no experiment, such as Logic and Moral Philosophy, and the Divinity class particularly; and I think it might even apply to some others. There was another suggestion I would make. I think there should be something like what we call a Directory, as to the subjects upon which the Professors are to lecture, so that it might be known precisely what are the topics the students are to hear lectures upon; so that beforehand they may prepare themselves a little, and also, that the Professors may not consume time in trenching upon one another's province. When I was at College, we had a course of lectures from Professor Finlayson, and very admirable they were; he dwelt at great length upon the Intellectual Faculties. Then we proceeded to the Moral Philosophy class, which was taught by Mr. Stewart, and from which we derived great benefit; but a great part of Mr. Stewart's course was occupied in going over the same ground. It is perhaps not of much consequence which of the classes takes the particular subject; but I think it is a pity both should have it, and be discussing precisely the same topics.

Would you propose that there should be a general scheme of study, so as to prevent one Professor from trenching on the province of another?—Yes; but it would be very wrong to make that minute or peremptory, for it might cramp the genius and talents of the Professors.

Should it be understood that every Professor might derive his illustrations from the studies superintended by other Professors?—Yes; he should take his illustrations from every source.

Is there any different distribution of the subjects of the course of the Philosophical classes in particular that you would recommend as facilitating such an arrangement as might prevent the two Professors lecturing upon the same topics?—No; I am not aware of any at this moment. That was a particular case which struck me that I have mentioned. I do not know how they proceed now.

Do you think the Philosophical classes are placed in the very best order, Logic being taken first, and Moral Philosophy next?—It depends very much on the meaning they attach to the term Logic. If it is considered in its largest application, and as far as it can be carried, it might perhaps be placed the very highest, and come after the others with great propriety: if it be considered as the art of reasoning, there must be the materials upon which to reason properly, soundly, and efficiently, which cannot be had without much previous study and information.

Do you think, if such a Directory were published as you recommend, and the Professors of Logic and Moral Philosophy did not occupy a considerable time in going over the same ground, and more time, therefore, being left to the Professor of Logic, he might undertake to teach Rhetoric, as is done in some Universities?—I think that Logic, from the nature of the subject, would occupy one Professor's time sufficiently if he were to adopt the plan of examining at separate hours, for it is a copious subject.

Do you think it would be desirable that the students should acquire a considerable store of facts, before attending the Logic class?—Certainly, in order to derive the greatest advantage from it.

Do you think it would be advisable to enjoin attendance upon the Natural History class at an early period of study?—Yes, I certainly think so. Natural History is a very important class, and it is one from which very young students may derive a great deal of benefit.

Would you propose to make that a part of the Curriculum, for the study of those who intend to take the degree of Arts, or to go into the Church?—I should like that arrangement very much. I consider Natural History so important, that, in the different Schools in which I have taken an interest, I have introduced it as much as possible for mere children; and I find they get a great deal of knowledge of useful facts, which they acquire very easily and recollect distinctly.

Is it your impression that young men generally attend the Logic class before they possess sufficient information to enable them to derive benefit from it?—I do think so.

Are not many of the most striking illustrations in a course of Logic, as taught in the Scotch Universities, derived from branches of study with which most of the young men are wholly unacquainted, such as the science of Optics and other branches of knowledge?—A great many.

Do you think it would be advisable to enjoin attendance upon the Natural Philosophy class, previous to attendance upon the classes of Logic and Moral Philosophy?—Yes, I think it is very desirable. I really think that these should come last.

In regard to any Curriculum of study for degrees, are you of opinion that the study of Physical sciences ought, at least in part, to precede the study of the science of Intellectual Philosophy?—Yes.

Are there any practical difficulties which occur to you in making such a change in the order of the Curriculum?—Why, all changes are accompanied with practical difficulties, more or less, from the attachment of those who have been previously engaged in those classes to their

University of Edinburgh.

Rev. Dr. A. Thomson.

15 November 1826.

own modes; but I do not see any insuperable difficulty. It would be requisite that the lectures upon Logic should be of a higher cast than what any Professor could venture upon, under the present arrangement.

Would it not lengthen the course of a student, were he required to attend Mathematics before the Natural Philosophy class?—I think it would require another session.

Would you think it desirable to extend the course of Philosophical study to five sessions?—Yes, I think it would.

Would that be attended with no considerable hardship upon some classes of students, say the students of Divinity?—Why, in one sense, it would be a hardship; that is to say, it would require more money, and it would be a longer time before the students could bring their talents into operation, for their own pecuniary benefit. But then they would come as more accomplished men into the field; and, with regard to this subject, I think, in general, students come too young to the Divinity Hall, and too young into the Church.

From your knowledge of the circumstances of that particular class of the students just now adverted to, would you consider it as being likely to bear so oppressively upon them, in a pecuniary point of view, as to form any substantial objection to such an arrangement?—No, I would not consider it as a substantial objection. It might be so if, in the least degree, it prevented us from getting a somewhat more than adequate number of Licentiates for the Church; but I have not the least fear of its producing that effect. When the students come to the fifth session, they would then be qualified for private teaching, which they are not at any previous part of their study; they would, therefore, be less objects of pity during the fifth session, which is proposed to be added, than during the four preceding.

Are you at all apprehensive that it would exclude from the Church those young men, in the humbler spheres of life, who are now able to enter it?—That has sometimes been imagined; but, after having turned my attention to it very much, I cannot say I have the least apprehension: for, whenever young men distinguish themselves for high talents, I have never found, in this country, that they are kept back by anything whatever; they always find people who patronize them, and there is an impulse in themselves which carries them forward, in spite of all difficulties.

Is it not your conviction that many such young men do find their way to the best situations in the Church, without having derived any assistance whatever?—Yes, very often.

With reference to the Literary acquirements of students of Divinity, as distinguished from their Scientific or Philosophical attainments, do you think it would be advisable that a longer attendance should be required upon the Greek class?—Unquestionably; that is what is very much neglected: we are very far behind in that respect.

Would you have the goodness to state anything that occurs to you on that subject?—If our Grammar and Parochial Schools were upon a proper footing, I think the first class in the College might be dispensed with; that is, the Professor might turn his attention to something higher and more difficult. But, in the present state of education in Scotland, I should think it a most serious injury indeed to attempt to put an end to the first Class in the University. As to Greek, there are very few country teachers in Scotland, comparatively, who are qualified to teach it.

Do you think, considering the small encouragement which is afforded, at present, to country Schoolmasters, that it may be reasonably expected, persons sufficiently versed in Greek will be obtained, so as to supersede the junior class?—The time was, when Scotland had a great number of Schoolmasters qualified to teach Greek and Latin. I do not see that we should despair of that state of things being again realized. It is too much the case, unfortunately, that those who have the charge of appointing Masters to Parish Schools, do not make a Classical Education a necessary preliminary; but, in many cases, they rather discourage such attainments.

Has not Latin, in some of the recent advertisements, been stated rather as an objection?—I have seen, within these few years, some advertisements, where that, at least, was not held out as any recommendation, but was rather discouraged.

Do you think that, at present, even if much greater encouragement were given, it would be easy to find persons capable of teaching all the Parochial Schools in Scotland, in such a way that young men might come to College from them capable of passing over the first Greek Class?—No: I must say, from my knowledge of the state of literature in Scotland, it would be quite impossible to get such a number of teachers at present.

Is it your impression, that from the class of Preachers it would be difficult to find them?—From my experience, I am sorry to say it would.

Have you had occasion to examine persons who had previously a licence to preach, with a view to becoming Schoolmasters?—Yes: in consequence of being a member of the General Assembly Committee for planting Schools in the Highlands and in popular Towns, I have examined several, who are Preachers, who have obtained licences from the Presbyteries, after going through a full course of education. We have, perhaps, examined half-a-dozen preachers, and three of them we have been absolutely obliged to reject, in consequence of their ignorance of the elements of Greek and Latin.

Were they capable even of teaching Latin?—No, not even Latin.

Had they respectable certificates?—They produced respectable certificates; but, as I said before, I placed very little confidence in them. We had recourse to examination, and the young men themselves were quite convinced that they were not qualified: they acquiesced, and did not consider that there was any sort of injustice or excessive strictness on our part.

Were the certificates that they produced from Professors?—They were.

Although it might be difficult, or perhaps almost impossible, to provide such a supply of competent Schoolmasters in general, yet, with a little encouragement, might not a great many be provided for Boroûgh Schools?—Surely.

University of Edinburgh.

Rev. Dr. A. Thomson.

15 November 1826.

Would that be an adequate provision, however, so as to supersede the necessity of the junior class at the College?—No; but at present there are a great many who come to College without even knowing the Greek Alphabet. I think it is a hard case that the Professors of the University should be obliged to teach the alphabet; I think that might be avoided.

Is it your opinion that if an arrangement were to be carried into effect by a regulation, declaring that, after a certain date, the elements of Greek should not be taught in the University, that would have the effect of soon improving the system of education throughout the country, so as to render the inconvenience or evil of short duration?—It would soon have a beneficial effect, especially if the landed gentlemen co-operated. The people at large would feel it, and yield to it: and those who are vested with the power of appointing Schoolmasters would look about for better qualified men.

With reference to what you have had occasion to observe, in regard to Parish Schoolmasters, is it consistent with your observation that, where the Parish Schoolmasters have been in rather better situations, and accustomed to teach, not only Latin, but a little Greek, and to take scholars with extra fees, and occasionally boarders, they have been in the habit of neglecting the children of the poor?—No, that is not consistent with my experience and observation. I never noticed anything of the kind; I was taught at a country school, where there was a great number of children. At that time 25 or 30 boys were taught Latin; and I must say, that the whole school was just as well attended, as far as one teacher could do in a school so large, as if there had been no Latin scholars.

Is not the necessary attention to the children of the poor, especially in a populous parish, enough to occupy any one man's time?—According to the old mode of teaching I think no man would be competent to it; but there are improved methods now introduced, and I think it is quite competent for any man to teach 500 children, and to teach them well.

And could he do that in a variety of branches at the same time?—Yes; but not so well, of course, as if there were two. No man could teach 500 Latin scholars and 500 English so well as two could, by each taking one department; but good teaching could be got for 500 in a country school.

With reference to the Literary and Philosophical classes, is there any particular course of study, or any order in which they should be attended, that you would be desirous of recommending for all those who are to go to Divinity Hall, or who wish to obtain Academical honours, or, generally, for the whole students?—I think the present mode is not amiss; if there were a fifth session, I think that would be a great improvement, taking in Natural History in all its branches as a part of the course, and transposing Logic.

Do you think it desirable, with a view to the advancement of Learning and Science, that the degree in Arts should be raised from the state of disregard in which it now seems to be placed?—Undoubtedly.

Are there any means which have suggested themselves to your mind by which you think that could be effected?—Yes; it might be done, I think, by just letting it be known that without certain attainments the degree cannot be acquired; and taking care, by public examinations, strictly to ascertain if those acquirements have been made. I believe, here they can insist upon an examination; I am not sure that they have not done it sometimes for a Master of Arts, but it has been very rare.

It being obvious that it would be in the power of learned bodies greatly to encourage and secure the success of such a plan, should you see any objection, supposing any such system were devised, to require from the students of Divinity, previous to entering Divinity Hall, the proof of having taken such a degree?—I am not just sure about that; I should like it if it were practicable.

Supposing it were in the alternative, that he should possess either a Master's Degree, or submit to such an examination as might be necessary for a Master's degree, should you see any objection to that?—I would not like a Master's degree, unless it were made certain that it was got in a proper way.

Supposing the Master's degree to be regulated in the way you have been speaking of, would you see any objection to require that before entering the Divinity Hall, a person should have either that Master's degree, or submit to an examination equal to what was necessary for obtaining it?—Yes, I am clearly in favour of examination previous to entering the Hall. It has been proposed in the General Assembly, but it has not taken effect; I should think it a very important change.

Are you aware that the Senatus Academicus of this University, about the middle of last century, issued some regulations by which no student was allowed to enter the Divinity Hall who had not acquired the degree of Master of Arts; and do you know whether the Church made any remonstrance against it?—No, I am not aware of it. I do not remember to have seen that fact mentioned.

Seeing that, in the suggestions you have stated, you would propose a course of study for the students of Divinity which would be necessary for those who were desirous of attaining the degree of Master of Arts (supposing that degree to be granted in such a way as to render it of value), would there be any hardship in requiring all the students of Divinity to take that degree in order to enter the Divinity Hall, as on your plan they must attend the same classes, and for the same length of time, although they did not take the Degree?—I think the one might be considered as equivalent to the other. If the examination is equal to that which is requisite before getting a degree, and is to be as satisfactory, it amounts to the same thing: and I am not sure that it would not be a hard thing, upon the whole, to require that they should have the degree; but I really have not attended to that particularly, so as to be decided upon it, though I am quite clear as to the necessity of examination.

From what you have now stated with reference to the utility of increasing the value of the

University of Edinburgh.

Rev. Dr. A. Thomson.

15 November 1826.

degree of Master of Arts, and thereby holding forth a greater incitement to study and exertion, are the Commissioners to understand that you consider it quite essential that the previous examination should be extremely strict?—Yes; it should be a faithful examination, and not a matter of mere form.

In order to carry the plan into effect, would you think it desirable that, in granting degrees in a particular year, there should be a classification of those taking them, so that a man might take his degree with higher honours or greater distinction, according to the extent of his attainments?—The University would be much improved if there were *degrees of degrees*. As the Faculty of Arts give the degree, we would not probably consider their examination, or that which is the result of the examination, as sufficient to qualify for admission into the Divinity Hall. We might have our own views of the attainments necessary; and the best plan would be, to have the examination conducted by such authority as might be agreed upon, in order to ascertain the qualifications for entering the Hall, independent of the degree of Master of Arts.

Has anything occurred to you in the way of improvement in regard to the length of the Session?—I think the Session is too short.

Do you think it is too short with regard to the classes in the Faculty of Arts?—Yes, I think it is too short.

Do you consider a session of six months sufficient?—Yes, that might be sufficient.

Would you recommend that there should be a summer session in some of the classes?—There are summer sessions for some of the classes.

But in any of those which have not summer sessions, do you think they might be introduced with advantage?—I am afraid not.

Suppose the Latin and Greek classes were to continue to be taught as they now are, and the boys were to go as young as they do at present, do you think that a six months' session is sufficient?—Certainly not. I think the present system is quite wrong there. I conceive that a boy going from the High School of Edinburgh to the first classes of College, is decidedly going back; I have no hesitation in saying so. He goes from the High School, where he is taught five hours a-day, with all the stimulus arising from emulation, &c., and for a period of ten months in the year, to a class where he is taught four hours a-day, for a period of scarcely five months; where, moreover, he gets the idea that he is an independent gentleman, perhaps, before he is past 13 or 14 years of age, and that therefore he has not the same inducements to study, nor the same inclination; and the consequence is, that, unless great pains are bestowed in private tuition, such boys must necessarily fall off.

What is your opinion as to the length of the session, with regard to those students?—In the present state of things, unquestionably, from the view I have stated just now, I should consider a summer session as essential to prevent them making that retrograde movement.

Would you make it imperative upon the young students to attend during the summer as well as the winter?—I feel a little difficulty as to that; for that supposes such a complete overturn of the present system, that one would not like to state anything rashly about it. I would rather make an improvement in another quarter, that is to say, by having them better prepared for the University.

Are you aware that in former times, when four years were fixed as the time necessary for obtaining a degree in Arts, it was the practice to attend College nine or ten months in the year?—Yes.

Is there anything in the circumstances of the present times that appears to you to render the revival of such a practice quite impracticable?—If it were made imperative, it would be submitted to, I dare say; people could not help themselves. But I rather think there would be a great general objection to it. It would become a great hardship on all boys from distant parts of the country, and upon the sons of clergymen and others.

Would it be a great additional expense?—Yes.

Do you think that, considering the circumstances of those students in the humbler ranks in life who come to this University, and for whom University education ought to be so much adapted, the prolonging the duration of the session to eight months, for instance, would be so seriously objectionable as to induce you to think upon the whole it ought not to be attempted?—Yes, upon the junior classes. I do not think the hardship would be so great upon the higher classes, where the students can do something, or perhaps a good deal, to support themselves by private teaching, in consequence of being farther advanced. But upon the younger students, who are attending the first and second classes, the hardship would be intolerable.

But is not that the period of life when, at the same time, you would wish to secure longer attendance upon the class?—Yes; but necessity has no law, and we cannot accomplish it.

You do consider that an improvement in the mode of teaching some of the classes at the University, would be preferable to a prolongation of the session, under the present system?—Yes, undoubtedly.

Does Dr. Thomson think it would afford encouragement to young men, who were disposed to distinguish themselves, if, without rendering attendance upon such class imperative, there did exist a summer class to which they might go, if they pleased, and which should be reckoned in their favour if they attended it?—That might be very useful.

With reference to the second or third, or more advanced Greek class taught by the same Professor, might there not be a difficulty in reconciling the summer class with the necessity there would be of adapting the second class to those who left him at the end of the winter session?—There certainly might be such a difficulty; but in all classes there is a great difference of capacity and attainments.

Do you think, therefore, that the summer might be advantageously employed, in many instances, in improving those who had not profited during the preceding winter?—Yes; and,

University of Edinburgh.

Rev. Dr. A. Thomson.

15 November 1826.

in speaking of a summer course, the Commissioners ought not to lose sight of the mode in which boys and very young men spend the summer. I may say, from what I remember of myself, and many others with whom I was well acquainted, that the summer is generally a time of very great idleness. Very often, boys lose in summer one half of what they have acquired in winter; and that is one of the great evils attending the practice of sending boys very soon to College.

With reference to the higher classes in the Divinity Hall, do you consider that the hardship would be such as to render it inexpedient to prolong the session?—No; as I said before, in those cases the hardship is less, for they are more able to support themselves by private teaching, with some help from their parents and friends. If it could be accomplished, I should certainly think that very little vacation at all should be given. The young men carry on their studies much better under the superintendence of the Professors, than they can do in remote parts of the country, where they have nobody to guide them, and no opportunity of getting books. But in these cases we must suit ourselves to circumstances.

In the experiments made for opening the classes for Mathematics and Natural Philosophy in the summer, was the attendance very considerable?—It was not considerable.

Was the experiment made more than one year?—I do not know if it was for more than one; but I am never for despairing, after only one or two experiments of that kind. I think if persons will persevere, and the good effects of a plan are once demonstrated, the prejudice against it is easily got over.

Is it your opinion that it would be very desirable to raise the standard of Classical and Scientific information?—Unquestionably.

Do you think it would be a less hardship to require a course of five years, each session being six months long, than a course of four years, each session extending to nine months?—Yes, certainly it would; and I think the course of five sessions is preferable on this account, that the persons coming into the Church are maturer in point of years, which appears to me to be of great consequence.

Would it not be desirable that at the end of every session a course of study should be prescribed, and, at the commencement of each session, the students should be particularly examined upon the course they have pursued during the summer?—I do think so. There is another suggestion which I would make as to the Professors: I think they should each have a Syllabus of their Lectures; I think that would be of very great consequence, so that the students coming to the class may not merely see the subjects upon which the Professor is to lecture, but may see them in the order in which they are to be discussed; and this beforehand, so that he can take advantage of what opportunities he has to prepare himself. He would come to the class with greater advantage than he can do now, when he does not know what is to be discussed. I believe that plan has been adopted in some classes, but I do not think it is general.

Would not the necessity of each Professor, after being appointed four or five years, publishing such a Syllabus, be of use to himself, in regard to his own exertions?—Undoubtedly it would.

By that means might not his exertions be compared with those of his predecessors?—It would be of great use, in every point of view, both for the Professors and for the students. There is another suggestion I would make: I think it would be of great consequence if there were more bursaries. We have got many small ones here; but they are not given to those who need them, and are entitled from their talents to get them, but generally from mere interest, and to serve friends. Now, if there were more bursaries, and they were to be given only to young men who showed, after a strict and proper examination, such talents as to deserve encouragement, it would, in my opinion, be of very great use.

Have you seen that the want of such endowments is an evil which has operated injuriously to the interests of the Church?—Yes; it would be expedient to have more endowments, if we could get them.

Would you propose to put them under a different regulation than that which prevails?—Yes; and they should be given only in consequence of merit in particular departments, being ascertained by a strict and public examination.

Is there anything you have to state with respect to the Education in this University, preparatory for the Church?—I would make the same remark on the Divinity class, meaning by that what is commonly called the Divinity class, that I made on the other classes. I think there should be more time bestowed than what has hitherto been done in the teaching of that class, on account of the extensiveness of the subject, the number of students, and the number of Discourses required. It is impossible for a man, whatever his talents may be, to give anything like a full view of the subject, and, at the same time, hear the Discourses, examine, and do all the other duties that are necessary to make the course sufficient.

Do you think that it would be possible to free the Professor who teaches that class, from any part of that labour, and to devolve it upon another?—I have noted down something upon that point. I have stated that there should be more Examinations and more Exercises. Though I have mentioned just now that the number of Exercises requires more time, yet I think the number is not half so great as it should be, for the proper instruction of the students, and for furnishing them with a stimulus to exert themselves, and teaching them to think and to write.

Would it be necessary that the whole of the time should be occupied in reciting these Discourses in the class?—No, I think that is a waste of time, particularly from there being five Exercises prescribed. These being in the form of Sermons, the students get the idea that they must be very long, which is erroneous. I would have the Discourses made much shorter, and a great many more of them. I would also have more Examinations.

University of Edinburgh.

Rev. Dr. A. Thomson.

15 November 1826.

Would you propose that any greater number should be read in the class than at present?—That, I think, should be done; and it might be done, if they were not so very long, but were short Exercises. If they were about three or four pages, and the Professor were to select some of the best, and make them be read, and give his remarks upon them publicly, and then remark privately upon those that were not read to the students themselves, it would be a much better plan than hearing discourses, which occupy half an hour or forty-five minutes, when, after all, perhaps, he is obliged to stop them in the middle.

In the case of private remarks, which you allude to, would not the benefit be confined to the individual student whose Exercise was longer?—It would; but I am supposing that a sufficient number are read, and that the Professor has an opportunity of making remarks upon them publicly; while at the same time, as they could not all be read, it would be right that the Professor should make such remarks privately to the other students who had given longer Exercises, as he might think proper, upon the doctrines that were stated, the mode of discussing the subject, the style of composition, and so forth.

With reference to the accomplishment of these views, would you have several hours allotted to the Professor of Divinity?—I would have two hours regularly; I would not have less; even more would be desirable.

With the view to obviate any supposed inconvenience from the interference of the hours of other classes, is it not your opinion that, supposing the previous education of the students of Divinity were sufficiently secured, the system of instruction in the Divinity classes ought to proceed upon the notion of making that complete, without sacrificing any part of the study of Divinity in its several branches to the notion of giving the students an opportunity of attending other extra-professional classes?—Undoubtedly; I would lay it down as the first and grand principle, that they have entered the Divinity classes in order to become accomplished Theologians, to fit them for going into the Church, and occupying the important stations which they expect, and are intended to fill, as Ministers of Religion.

Do you mean that with reference to the circumstance of their having first secured a Literary and Scientific education?—Yes, certainly.

In that point of view, the number of these classes being comparatively limited, would there be any difficulty in finding ample time for the studies of that class of students?—No, none.

Considering that the previous Education, which, according to the suggestions you have now offered, is supposed to have been attained, what is the order of the attendance upon the classes that you would desire to see prescribed for the student of Divinity?—At present, there are three classes which are called Divinity classes—the Church History, the Divinity, and the Hebrew Classes. I would suggest, as a change that is very important and essential, an additional Professorship of Biblical Criticism, which is a study that has been very much neglected, and the neglect of which has tended very much to lower the respectability and learning of the Scottish Clergy; I would make attendance on this class quite imperative upon the student. The suggestion made as to some of the other classes, in the preparatory part of the course, applies, as I said before, in my opinion, more directly to the Divinity class, as to the mode of lecturing. I do not think it necessary that the Professor of Divinity should give a full dissertation upon different points as he goes along; for, if he does, the course is lengthened out too much; and, in short, it becomes interminable, as was the case with a very learned Professor, Dr. Finlay, of Glasgow, who never got to the end of his course. He liked to dwell long upon every point, and the young men never got a view of the system of Theology. As the students are required to attend a certain number of sessions, that they may be qualified to undergo examination for Presbyterian licence, it is but fair they should have a full view of the system,—that no branch of it should be left out upon which questions may be asked,—and that he should not be able to say, I never went so far as that, and I cannot answer any questions upon that subject. It would be highly expedient that the Professor of Divinity should confine himself very much to a general outline of the different subjects, and that he should direct the students to those numerous publications where they may get all the information he could give them, if he were to live a hundred years, and where they can get it with much more advantage than from his minute and protracted dissertations. He might mention some particular book, where the student could get information upon a particular subject. It would be his business to read that book beforehand, and to tell them how they should read it, so as, perhaps, to warn them against turning their attention to portions from which they could not derive advantage, and make them confine their attention to other parts, where the most valuable information was to be obtained. By attending to this method, he might easily give to the student a full view of the system of Theology, in the course of the three years which form the course, according to the present laws of the Church. Then he, of course, should have Examinations to a considerable extent, both to stimulate to exertion, to ascertain progress, and also to convey instruction.

Are you aware that that system has been lately tried, with success, at St. Andrew's?—No, I am not; I have heard of it, but I cannot speak of it with any certainty.

Would you propose that the Examinations by the Professor of Divinity should relate entirely to Systematic Theology, or that they should extend to general Literature, for the purpose of keeping up the acquaintance of the young men with their previous acquirements?—It should be discretionary with the Professor; but he should consider himself bound to examine upon every point which illustrates the subject, and tends to ascertain the progress of the students, and to keep up their acquaintance with general Science, as far as is consistent with the main object.

Would you wish that all the students attending the Divinity Hall were in one class, and hearing the same lectures, or would you think it useful to divide them, if time could be found?—If time could be found, and a proper arrangement made, it would be better they should be

University of Edinburgh.

Rev. Dr. A. Thomson.

15 November 1826.

divided: that is just one of the difficulties attending the subject which I have felt, but which I do not think at all insurmountable.

Would it be objectionable that the Principal, who is the Primarius Professor of Divinity, should also teach Divinity, or would you say that Systematic Theology should be confined to one Professor only?—I think it would be better if it were confined to one, provided there were some relief given in some parts of the course which now exists. At the same time the Principal is entitled to lecture on Divinity, if he chooses; and I think he might be very usefully employed in giving lectures, for instance, on the conduct becoming students, and other things of that kind, which would come with considerable authority from him, and bring him into closer contact with the young men than could otherwise take place.

Might he not assist, in regard to Discourses and Exercises?—I think it would be a very good thing for him to be present. I am not sure of the expediency of a direct interference, by his giving opinions upon Discourses; but I think his presence might be useful, and he might now and then assist, if the Professor were indisposed.

Are the Exercises, which you would wish to see prescribed and required from students in the Divinity Class, very much in the character of the Exercises you would desire to see from the students in the Literary and Philosophical Classes?—Yes; except, of course, that they should be in a higher strain. I would have them frequent, and I would have them short. One advantage would be, that it would lead students to avoid that diffuseness which they are apt to get into, just from not taking time to condense their thoughts.

Supposing the Church should still consider it to be requisite, before licensing Preachers, that a certain number of Exercises, more of the character of the Discourses now delivered, should be given by the students at the Divinity Hall, which, as they are scattered over different years, seem to be no great test of the progress of the students, would there be any inconsistency in the Principal hearing some of them?—No, I do not think there would be any great inconsistency. I have two suggestions which, if they were adopted, would relieve the Professor of Divinity of two of the five Discourses which are given by the students, according to the regulation of the Church.

Will you have the goodness to state them?—These suggestions refer to an additional Professorship, and to the employment of the Professor of Church History With regard to the Church History class, it might be so arranged as to lighten the labours of the Divinity Professor. Let him take one particular branch of Theology, in addition to Church History: for example, Polemical Theology; and then he could hear the Latin Discourses which go by the name of Exegeses, and which are generally of the polemical kind. That would be a relief as to that kind of discourse. In the class of Church History there ought to be not only lectures on the ancient History of the Church, or the History of the Church in general, but also upon the modern History of the Church, particularly our own National Church, and the sister Churches of England and Ireland, and the state of the different Churches on the Continent, and on the progress of Religion in different countries,—with regard to all of which, our students in general are, I am afraid, very ill informed. Indeed I know it to be the fact, and it is a great defect in their attainments. I consider this class to be very important. In the course of conversation, I have heard many people talk slightingly of it; but I think it is of great consequence to keep its importance in view, as affording many topics of great interest and utility: such as the Jewish Dispensation, which occupies so large a portion of the Bible; the connexion of that Dispensation with the Dispensation of the Gospel; the origin and causes of corruption; the history and principles of Religious Establishments; the rise and progress of the great leading Heresies; the rise and progress of the Mahommedan Faith; the state of Judaism and Paganism at different periods; the Reformation, its causes, circumstances, effects, and so forth. I conceive that the Professor, without dwelling upon minutiæ of Church History, which is often a very trifling, and worse than useless subject of discussion, has a large field before him, bearing most directly on the learning, and usefulness, and efficacy of the Clergy. If he were to undertake the discussion of Polemical Theology, he might relieve the Professor of Divinity of a good deal of what he must attend to now. By hearing of the Exegeses, he would relieve him of one-fifth part of the discourses which he has to hear, according to the present system. The Professor of Church History should prescribe as many exercises as, in his discretion, he may think proper for the student, and he also should examine.

That being a Class, the prosecution of which by the students seems peculiarly to depend upon their own private reading, would the Examination be indispensably necessary, according to your view?—Indispensably necessary. I have remarked that a Professorship of Biblical Criticism would be extremely useful. The subject comprehends a variety of important topics: such as the true principles of translation; the proper mode of interpretation; the Hebrew manuscripts of the Old Testament; the Greek manuscripts of the New Testament; the various readings; the general style of Scripture; the peculiar style of the different sacred writers; the peculiar language of prophecy; the use of the cognate languages, as the Chaldee, Syriac, Arabic, and Ethiopic, as helping us to understand both the Old and New Testaments; the opinions, manners, dresses, customs, natural history, arts and sciences, which prevailed among those who wrote the Scriptures, and concerning whom they were written; and the application of the one to the elucidation of the other; and the various editions of the Bible that have been published by learned men; and so forth. Indeed, I should say, that this class is not only important, but essential. In my time, there used to be a lecture once a-week upon Biblical Criticism, but it was of the most meagre kind. It consisted merely of some critical remarks upon a passage of the New Testament, which is, comparatively speaking, nothing at all.

Do you think that the objects of such a class could be embraced in one year?—No; I should propose that at least two years' attendance should be required.

The class of Ecclesiastical History, then, would require two years?—Yes, two years at

University of Edinburgh.

Rev. Dr. A. Thomson.

15 November 1826.

least. I have further to remark, upon that Professorship of Biblical Criticism, that the Professor would naturally hear that species of discourse called Exercise and Addition, which the students are obliged to give in, and thus relieve the Divinity Professor of one-fifth part of the labour which he has to undergo at present in hearing Discourses. It is a critical kind of Discourse, and it comes within his province exactly.

Among the advantages which you think would result from the institution of such a Chair, and attendance upon it being required, would not one be obviously important, namely, that of its maintaining and increasing the literary acquirements of the students in Divinity?—Undoubtedly; and, if every College had a Professorship of that kind, there would be a great stimulus afforded to the Clergy (not merely to the young men, but to the Clergy who are already settled) to continue their attention to the subject, as the Chairs would be objects of ambition to them, whereas, at present, there is no such thing.

With reference to the mode of teaching that class, would it not be of importance, for the interests of the students, that the Professor should have it in his power occasionally to hear them read parts of the New and Old Testament in their original languages, and with reference to those particular topics upon which he might lecture?—Yes, I think it would be very useful.

Is it your impression, that that branch is very insufficiently cultivated in Scotland?—It is scarcely cultivated at all; nor do I think it possible for the Professors of Divinity at present to pay any attention to it.

Is there not a Professorship of that kind at St. Andrew's?—No, I think not. Dr. Gerard, at Aberdeen, paid great attention to the subject, and has left behind him an admirable treatise upon it.

Is there any order in which you would desire to see the Divinity classes attended, supposing them to be modelled as you have stated?—It might be arranged that the study of Divinity might go on for three years at least; that is to say, a student bound to attend regularly might attend three years, and enrol the fourth. I would propose, that the Church History class should have its course completed in two sessions. I would propose, that the Professor of Biblical Criticism should also lecture two sessions; he has abundance of materials, and he might hear his pupils read Hebrew and Greek. The Professor of Hebrew should certainly be attended two sessions.

Do you think that those two sessions might be the two first?—Yes, I think they ought.

With reference to the advantageous prosecution of the studies in Divinity, will you favour the Commissioners with your opinion as to any arrangement that might be made, by which the length of time that would be necessary for their attendance could be obtained without reference to the present regulations of the Church?—Why, it is very difficult to make an arrangement as to the class of Biblical Criticism: that should be attended, one would think, from the beginning; and so also should the Church History; but then we might involve the students in too many classes the first year. Perhaps we might delay the Church History class, as it comprehends Polemical Divinity, to the second and third years.

Would you favour the Commissioners with your opinion as to what will be a complete thorough course of study, supposing the period of attendance at Divinity Hall could be prolonged, laying aside all present regulations?—I think that there should be four sessions of regular attendance. Irregular attendance, I consider no attendance at all: and it is one of the greatest calamities that can befall a University to have any idea of irregular attendance.

But, laying that aside, will you favour the Commissioners with your opinion as to the order of attending the classes, and of the studies of the different young men, if you were afterwards able to acquire a proper period of time for their prosecution?—It would require a little thought and a little comparison, to make it out satisfactorily. I did not think of that sufficiently before I came here.

Would you wish Hebrew to be learned at the beginning?—Yes, I think it should. Biblical Criticism cannot be taught without Hebrew, and, therefore, Biblical Criticism should come after the Hebrew. It would be well if the Hebrew could be got a year before entering the Divinity classes. It is an odd thing to come to the study of Divinity ignorant of the language of the greatest portion of that volume on which the whole of Theology rests.

Supposing the period of the Curriculum for Arts were to be extended to five years, might Hebrew be taken the last year?—It would be a much better arrangement that the students should come to the Divinity classes with a knowledge of Hebrew.

Do you think that an Exercise and Addition ought to be prescribed upon a passage from the Old Testament, as well as the New?—Yes, I do.

Do you think that every student might give that other Exercise?—Yes; and I think he should give more, if possible, in the Biblical Criticism class, where there would be an opportunity of giving a number of Exercises of that kind, which are certainly very important.

With regard to the subject of irregular attendance, laying aside for the present all question with regard to the authority by which that matter may be altered, will you have the goodness to state what may occur to you on that subject, for the interests of the Church?—The great advantage of regular over irregular attendance at the Divinity Hall is unquestionable; and I say this, *first*, on general principles, *next*, from experience, and *lastly* from observation. I say it, *first*, on general principles. At College, the student has the Professor to guide his studies, while in most cases he has no such guide, or no guide at all in the country: at College, he has books in abundance; in the country, he has a very scanty supply: at College, he has companions engaged in the same course of study to converse with; in the country, he has often nobody: at College, he enters into societies where he must write essays and debate questions, which give him habits of thinking and reasoning with accuracy, while, in the country, he can have no such opportunities: at College, he has access to engage in other studies which tend to invigorate his mind and enlarge his knowledge; in the country, he can have this

University of Edinburgh.

Rev. Dr. A. Thomson.

15 November 1826.

advantage, only in a very limited degree, if he have it at all; at College, he is understood to devote himself to his Theological pursuits, as his main concern, and, from the requisitions made on his time and labour by the Professors, he is prevented from undertaking an undue quantity of private teaching; but the very circumstance of his being in the country shows, that teaching, whether in a school or in a family, is his principal business, and the study of Theology is made merely a subordinate employment; and the fatigue of so much teaching, as this supposition implies, is extremely unfavourable to mental exertion. In arguing this matter, I have sometimes heard it urged, and in the General Assembly, many years ago, it was urged, to justify the granting of licence to a young man who had never attended the Divinity Classes at all, that a clergyman's son can best learn Theology under his father's roof. But, in the first place, a great number of the irregular students,—indeed the greatest proportion of them,—are not clergymen's sons; and, in the second place, it cannot be expected that clergymen are either so well qualified, or have so much leisure, as the Divinity Professors, to attend to the Theological education of their sons: and, if it is of any advantage to be under their fathers' roof, they enjoy, during the long summer vacation, that paternal tuition which may be useful in assisting them to revise what they have been doing the preceding session, and to prepare them for the exercises and the duties of the session which is before them. *Then*, I say it from my own experience. I was an irregular student so far that I attended the Divinity Hall only one session regularly; and I have no hesitation in saying, that I made greater progress in Theological study during that one session than I did during all the other sessions. I felt all the disadvantages which I have already enumerated; such as want of stimulus and of books, unfitness for study after the fatigues of teaching, &c.

Had you the advantage of living under the roof of a father who was a clergyman?—Yes, I had, and he had a tolerably good library; but then, perhaps, I wished to see a book on a particular subject, and he had it not. That was a damper altogether. I sometimes got books from the Divinity Hall. We had a sort of privilege in getting them, but it was so difficult and troublesome to avail ourselves of it, and we were so often disappointed, that the discouragement was very much felt.

Had you greater access to books than the majority of students in the same situation?—Yes, I had.

Must it not frequently happen, that the greater portion of students who are living as tutors in a family, in a remote part of the country, must, with the exception of such Theological books as they have themselves, be without the means of getting such Theological books as are necessary for their studies?—Yes: perhaps the clergyman of the parish is the only person from whom they can get a supply of books; and his collection is very, very scanty in general.

The fact being that attendance for one single day in each year of irregular attendance is at present sufficient, is not the notion of irregular attendance as a part of University education, a sort of imposition upon the country and the Church, seeing that there is not any sort of academical study pursued in those years?—I think it is quite an absurdity. We have been long accustomed to it, and therefore do not think much of it; but, supposing it were presented to us for the first time, I am satisfied we would laugh at it, as the grossest absurdity that could be imagined. We require regular attendance, through the preliminary parts of education; but when we come to those parts which are to fit us for the duties of life, attendance is allowed to be quite irregular. So far as I have had opportunities of judging, I think that those who attend regularly, are superior to those who attend irregularly. There may be exceptions, there must be exceptions; for a young man of vigorous intellect and diligent habits will make his way to eminence through the greatest difficulties and discouragements: whereas a young man of idle dispositions and slender capacity will make no progress amidst the greatest facilities and privileges. But, from what I have seen, I am convinced the general fact is, what I have now stated it to be.

Do you consider that the interests of the Church would suffer by being deprived of the opportunity of having that class of young men who are tutors in families of men of rank and consideration in the country?—Not the least: the only effect would be, that these families would get tutors much maturer in years, and much maturer in knowledge and general fitness for their situation. I would rather put the young gentleman of the country under the tuition of a man who had completed his education than of a young man who is almost beginning it. And, I conceive, the instructions they get from the former,—supposing that he could only continue with them a year or two, or two or three years,—of more importance to them, than the instructions of a mere stripling.

Do you consider that the object of instructing the Divinity Students is in a great measure sacrificed to the object of enabling them, in many instances, to attempt to convey instruction to others?—I do think so.

Do you understand that the practice of irregular attendance has always prevailed in the Scotch Church, or that it has very much grown up of late years?—It has grown up of late years.

Was it so prevalent formerly?—No.

Was there an original law requiring any specific attendance?—There was a full Academical education, formerly required for those who entered the Church. The degeneracy which has taken place in that respect, did not arise, I apprehend, from any defect in the law. One of its causes was, that there was a greater scarcity of applicants to fill the situations of clergymen in the country, and therefore greater indulgence was given. But, now that we have a superabundance, I think it is the best opportunity for raising the standard of Theological learning.

University of Edinburgh.

Rev. Dr. A. Thomson.

15 November 1826.

Would not the result of the general system which you have recommended, be nine years University education?—Yes, it would.

By that means would a young man, entering College at fifteen or sixteen, be licensed at twenty-four or twenty-five years of age?—Yes; and that is soon enough.

With reference, however, to the other object, might not that throw rather more young men than you would desire to see, out of the situations of tutors altogether?—No; gentlemen would get them more advanced. Now, they go into families at seventeen or eighteen years of age, when they are just entering the Divinity Hall, which is too early both for themselves and their pupils.

Would there be no danger of the tutor, who was admitted at that age, looking for preferment so early as to create disappointment?—I have no doubt there would: but what I say in reply to that is, that the gentlemen in the country are better off with tutors so much more qualified for their situation than the others, even supposing they should be obliged to part with them sooner. I do not look upon it as an evil in a private family to have a change sometimes. If not frequent, it is very often extremely beneficial.

Is it the fact, that a great proportion of those who are placed in Churches, soon after they are licensed, are those who have been tutors in private families?—Yes, that often happens.

Would not the result be, that, according to the views you have stated, the opportunity of getting into the Church would not occur until after they have been tutors?—Yes; if the system were universal, it would be the same thing; for the Church must be vacant before the tutor can get it.

Do you consider, that the late alteration in the law, making a year's regular attendance imperative, an improvement?—Yes, I do.

Do you recollect if any of the young men who were examined for the Schools in the Highlands, and who were found unqualified, had been tutors in the families of gentlemen of respectability?—Yes, I do recollect that.

Did you consider them quite unfit to conduct the education of even the poorer inhabitants of the country?—Yes; and I remember very well that, in one case, a young man produced a certificate from the gentleman in whose family he had taught, expressing the highest satisfaction with him and with the progress his children had made. Certainly, they must be very bad before we would reject them, for we have a sort of feeling in their favour; but I have known them rejected, because it was quite impossible they could do the duty, even in the Highland Schools. They might have taught English, though I do not think they could have done it very well; and they might have taught writing and arithmetic; but as to teaching Latin and Greek, it was quite out of the question.

As to a general system for the regulations of the studies of students of Divinity, would you consider it an important object that there should be degrees granted in Divinity, after examination, such as the degree of Bachelor of Divinity, in the same manner as the degree of Master of Arts is granted?—I have not considered that point, but I think it would not be a bad measure.

With reference to the prospect of a young man entering into the Church, would not the opportunity of taking such a degree with distinction be of vast importance to him?—I think it would; it would lead to greater diligence upon the part of the student, and promote his improvement exceedingly.

Supposing the degree of Master of Arts were to be taken before he entered the Divinity Hall, with a view to giving him the full benefit of the character arising from the attainment he has made, would not the introduction of the degree of Bachelor of Divinity, to be taken after strict examination, be of great importance to his prospects?—I have not considered that point maturely; but it appears to me it might be advantageous.

Is there anything in the nature of the subjects upon which examinations for such degrees take place which, in your opinion, ought to preclude their introduction into the Theological classes?—No, certainly not.

Do you think any provision ought to be made in the University for the religious instruction of young men; such, for instance, as requiring them to attend Church?—I have thought upon that subject, and the idea I entertain is, that provision should be made for their religious instruction, and that there should be a place of worship, and regular service performed, not for the sake of those whose constant residence is in town, but for the sake of those, of whom there is a great number in this University, who come from different parts of the country. They are thrown quite loose; and they either cannot get access to the churches, or they make the want of a particular church for students a sort of justification for neglecting worship altogether. At the same time, I would not like to see attendance made peremptory, and exacted under pain and penalties. I should not like to force or compel students to attend.

Upon what sort of principle would you regulate their attendance—merely by their own wish, or that of their parents?—By their own wish, or that of their parents; and let the Principal and the other Professors look over them in the way of giving advice, remonstrance, reproof, and so forth. But I would not compel any class, particularly young people, to attend divine service, as it would rather increase the resistance which many of them already have to religious exercises. That accords with my observation upon this subject: but I think it is not becoming a University like this, that there should be no opportunity of that description afforded to young men who come from distant places. If there were a man of sound principles, who was a good and an attractive preacher, put into a situation of that kind, he would secure a large attendance, and might be exceedingly useful to the students.

It appearing that Professor Jardine recommends, in his Outlines of Philosophical Education, that all the Philosophical classes should be opened every day with prayer, are you of opinion

that, supposing the provisions and arrangements which you have now mentioned, were carried into effect, that would be necessary in the classes?—I think it very becoming, if the prayer were short, and offered up reverently. I have seen it done in such a way that I would rather it had been omitted.

University of Edinburgh.

Rev. Dr. A. Thomson.

15 November 1826.

Looking to the fact, that the Professors may not be clergymen or persons of clerical habits at all, is it a regulation you would wish to see introduced in all the classes?—I should certainly wish it. Professor Dalziel did it; on Monday morning there was a Latin prayer.

Are you aware whether the practice of opening classes every day by prayer, is followed by some Universities now?—I am not.

Edinburgh, Friday, 17th November 1826.

The Right Honourable LORD BINNING in the Chair.

Francis Jeffrey, Esq., Advocate, and *Thomas Thomson*, Esq., Advocate, called in.

Mr. *Jeffrey* examined.

F. Jeffrey, Esq., Advocate.

17 November 1826.

The Commissioners are desirous of knowing from Mr. Jeffrey if, having turned his attention to the Constitution, Discipline, Course of Study, or any other matters connected with the interests of Literature and Science and of Education in the Scotch Universities, he has any suggestions to offer, by which those interests might, in his opinion, be best promoted, particularly in the University of Edinburgh?—Really I am not aware that anything which has occurred to me is likely to be either new or important; but I will state one or two things that have occurred, though I certainly think it probable that they have been suggested by others, and, I dare say, are down upon your Minutes already. As to the *constitution* of this University, I really have not given much attention to it, partly because I conceive it to be in a great degree authoritatively fixed by the deeds of foundation, and partly because I have not contemplated it as likely that it should be generally remodelled by legislative authority. The only thing that has appeared to me desirable, if it could easily be had, is to have something in the nature of a Visitatorial Court established, by which the necessity of recurrence to Courts of Law, or even to such more authoritative and higher tribunals (as this, which, of course, cannot be frequently convoked,) may, in a great measure, be avoided. Whether that should be done by the appointment of a Chancellor, which this University, I believe, is without, or of an officer with any other name, or of a Visitatorial Court, composed of a number of persons, and by what authority either of these should be appointed, I confess I have not considered so deliberately as to feel disposed to suggest one as being more preferable to another.

Do you think that the Chancellor, together with such Assessors as it might be deemed convenient to appoint, should act with visitatorial authority?—My opinion is, that either the Chancellor or some other person should have full visitatorial authority, as that is exercised in the Colleges and Universities in the other end of the kingdom, and, indeed, in most foundations for public purposes in which such officers exist. I think the exercise of that authority extremely salutary; and the Courts of Law can always interpose if there is a defect or abuse of the visitatorial power. The name of Chancellor, being an ancient Academic name, has its advantages; but, if such an office were established, the nature and extent of the powers incident to it might be defined in the act of creation. In whatever way it was done, I should lean in one respect to an alteration in the nature of the appointment, as it has hitherto existed in some of our Universities. I think it is disadvantageous that it should be an office for life; for a person grows old, or otherwise occupied, and serious dissensions may arise, which may totally disable him from acting. I should, however, be for having the term of the office considerably long, but not for life. I should not like it to be an annual appointment. I would limit its duration to six or seven years. I think also that if the power were to be vested in a single officer, he should have a Court of Assessors. I may, perhaps, venture to say, I have thought it might be one of the means, with a view to another point, upon which I may have to say a word or two afterwards, of giving value and importance to Academical Degrees, if the nomination of such an officer should in part be by the suffrage of those who held them. I think, indeed, that between that and Royal nomination there is no choice. It would be quite unfit to give the nomination of such an officer, or his assessors, to the body itself, whose proceedings and actions were afterwards to be controlled by them, and who, as a body, may stand in opposition to other bodies, such as the Patrons, between whom this Court would have to mediate. I think it should either be a nomination by the Sovereign or by something of a popular Academical election, confined, for instance, to the Masters of Arts. Such a Degree would then be felt as conferring a privilege. The same franchise should certainly be extended to the higher members of the University, such as the Professors; and their votes, perhaps, should be allowed to count for more than the others, so as to give them a due degree of weight in the election. If it did not occur oftener than I have stated, there would be no danger of giving too much of a democratic spirit to the youth; and, by confining the privilege to those who were Masters of Arts, we should neither render the body so numerous, nor would it be so likely to lead to any undue warmth of canvassing as if it were committed to the whole body.

Seeing that the rights and privileges of the Patrons of this University might sometimes, as it appears they now are, become the subject of plea and discussion, do you think that it would be a good expedient to allow the Chancellor to be named by the Patrons?—I think not; and, after all, I think the Crown's nomination is not very objectionable. There is no choice, I consider, between placing it under the supreme authority, or giving it to those who are Masters of Arts, which I suggest really more with a view to the dignity and attraction which would thus be attached to an Academic Degree than to any great benefit to be gained by it.

University of Edinburgh.

F. Jeffrey, Esq., Advocate.

17 November 1826.

I certainly think the infusion of a little popular spirit would do some good; but it is more with the latter view I suggest that such a franchise should be given to the Graduates, than from any notion I have that it would secure a better nomination.

Do you think that the nomination by the Crown is less exceptionable, provided there be Assessors?—Yes; but the Assesors should be partly chosen by the Chancellor himself, and the other part by the power that is named or agreed upon.

Would you have the existence of this Court of Assessors coeval with that of the Chancellor? —Of course; it would be like the Sovereign and his body guard, or Privy Council, and they would demise all at once.

Besides his visitatorial power would you give the Chancellor authority to decide upon all questions of dispute between the Senatus Academicus and the Patrons?—I think that would be involved in my notions of his visitatorial power, which would be very ample where nothing contrary was provided by the Statutes of the Foundation.

With respect to the constitution of this or any other Scotch University, is there any further suggestion you have to make?—I think the office of Chancellor ought to be new modelled, in conformity with the new office under that name contemplated here. I do not think it is generally well understood what its nature is, and I do not think the powers of the Chancellor have been practically recognised. There was one case relating to the King's College, Aberdeen, in which it was a question whether the Chancellor had a visitatorial power, which the Court waived deciding. But I do not know that it has been recognised.

If there were a Chancellor, with a Court of Assessors, in this University, do you think that there would be any necessity for having such an officer as that of Rector?—I think the Rector is more of an every-day officer, who should interpose more closely in the common conduct of the business of the University, and to whom appeals should be made upon all questions of violation of discipline, as well as exercise the other functions of auditing accounts; and if there is any indecorum among the students, or any dissension among the teachers, he may look to it, in the first instance, and enforce and regulate the rights of those who are the subjects of the University, and enforce obedience to their lawful superiors.

Do you think that the Rector should be one of the Court of Assessors?—I have not considered that; my first impression is, that he should not. I think that, as an Academical Officer, the functions of his office might be the subject of discussion in that court.

Would you consider the Rector as a constituent member of the Academical body?—Yes, certainly.

Does it appear to you that it ought to be made imperative upon the Chancellor to hold Courts periodically, by himself or his deputy, or only when occasion called for them?—The Chancellor should always be accessible to persons having interest, but his deliberations on these applications should be effective, though they were in the shape of refusing to hold a Court; and his decisions should be solemnly given.

What is your opinion generally respecting the mode of choosing a Rector?—I am not sure that I have considered that sufficiently; and I am not sure that I am very fit to consider it impartially. I can only say, that so far as I have seen the effects of a popular choice—of a choice more popular, perhaps, than, in abstract reasoning, a deliberative body would introduce or recommend—I have seen no evils result from it; and therefore I should be inclined to think, upon the grounds I stated before, as to the election of a Chancellor, that everything that gave the youth a feeling of the value and dignity of the *status* belonging to them as such, should (if there were not plain and imminent hazard of abuse) rather be increased than discouraged. I think, in a literary society, where good temper and liberal conduct prevailed among its rulers, there would not be any great hazard of disorder, though there is, no doubt, in all such bodies, the germ of a rebellious spirit, a tendency to foolish and absurd usurpations of power and contradiction to authority, incident, I fear, to the age of those who compose them, and requiring to be vigilantly watched. If I were called upon to fix the power of nomination in the present state of discredit and disuse into which Academical Degrees have fallen here, I cannot say I should wish, at first, to limit that appointment to persons holding such Degrees; but, at the same time, I should not be anxious, where there was no established practice or vested right, to extend it so far as it is extended at Glasgow; but I would confine it to students of a certain standing in the University—such, for example, as had attended at least two years.

Are the Commissioners to understand that you are of opinion that the privilege should be enjoyed only by real *bonâ fide* matriculated students?—Certainly.

Supposing the value and importance of degrees in the Scotch Universities to be raised, and consequently many degrees in Arts to be taken, should you see any objection to changing the system, where it had previously been more popular, so as to confine the privilege to Graduates; or, at least, to go no further down than the youth who have finished their course of study, without suffering it still to extend to those who are only going on with that course?—A great deal will depend upon the extent to which the habit of taking degrees had been carried. If it became usual for all persons who received a liberal education, with a view to a profession, or gentlemanlike situations in society, to take degrees, I am not sure that I would think it necessary to make it more popular. I rather, indeed, think not. At the same time the residence of youth at the seats of education, generally terminating with their degrees, it would certainly require a great deal of trouble afterwards to convoke them in considerable numbers, and would give an advantage to those who had just obtained their degrees. It ought therefore, perhaps, to be communicated to persons who have not got the degree, but who were in approximation to the attainment of it.

Would there be no risk, according to the existing popular system, that a great deal of canvassing might be introduced by the Professors, among the young men attending their own

University of Edinburgh.

F. Jeffrey, Esq., Advocate.

17 November 1826.

classes, which might have the effect of undermining the authority of the Professor, and produce a lawless and negligent spirit?—Upon my word, if the Professors were to act as they ought to act, I do not think there would be any great danger of that. So far as I have seen, I think the young men are much guided by (what is perhaps a pretty safe guide) public opinion, and the degree of notoriety—I ought not, perhaps, to say celebrity, but the degree of notoriety—the objects of their choice have obtained, than from any private canvassing and solicitation. I rather believe—and that is one advantage—that in a large and various body, it is not easy to unite suffrages in favour of an unknown individual; and there is such a sense of decorum among them, even those of the most tender age, that I believe they have not generally or frequently—I have not known that it has been done at all—given their suffrages to one notorious for qualities otherwise than honourable.

Even in the case of two most excellent and unexceptionable persons being proposed to such a body, might it not sometimes occur that the most mischievous of all feelings that can be introduced into a College, might be excited, namely, political feeling?—There might be some little hazard of it; but I am not aware that it has ever operated much. Perhaps there is less risk of it in the system that prevails at Glasgow than anywhere else, a very large proportion of the voters being really below the age at which political feelings are developed—being almost *impuberes*—and belonging to a period of life when they have hardly attained the rank of citizens.

At what part of the session do you think it most advisable that such an election should take place?—Either at the beginning of the session, or at the end. I think it would be better at the beginning, for the tumult of canvassing would be all closed with the election.

What is your opinion, generally, as to the proper quarter in which Professors should be nominated?—Upon my word, I rather incline to think their nomination is safest where it is highest. If local influence could be excluded, I would prefer Royal nomination. One has Utopian notions about the benefits of a popular election; but this is so certain to generate heats and animosities and exaggeration, that, though you might be avoiding some evils, I am not sure you would not render others, which are of greater weight upon the whole, more certain, practically. It may appear a little paradoxical, but I do not see that such a body as the Corporation of Edinburgh, considering the spirit with which modern corporations in large towns are now conducted, and from "the form and pressure of the age," *must* in fact be conducted, is very unfit. I think, as the general spirit of liberality and feeling of dignity among the local Magistrates in Edinburgh and in all great towns are progressively developed, we are every day more and more secure against their acting on any paltry and absurd bias of mere personal favour for the individuals canvassing them, unless there is a near equality of pretensions. Every day there is growing among such functionaries more and more a feeling of responsibility to the public, while they certainly possess a knowledge of what will promote the greater interests of the community. In smaller towns it might be dangerous. Abstractly considered, they do not seem the fittest judges; but they must act as His Majesty would act, though possessed of less wisdom and learning. He will be advised by his advisers, and so will they.

Has it occurred to you that there ought to be the concurrence of more than one authority, before a person could be finally appointed to secure the nomination of fit persons?—I have not thought of that, and I confess it does appear to me to be full of difficulty: from the clash that would arise, and the zeal there would be for maintaining the first appointment, and then another negativing it, it would lead, I fear, to unpleasant feelings. One has contemplated, that if there were a remonstrance, or a certain amount of opposition from certain quarters, that should be a ground for stopping the induction of the person originally nominated. But I confess I have not myself been able to digest any practical system that is not liable to great objections; and therefore I doubt if it is feasible. The principle seems entitled to great consideration, and I would not be understood as giving any definitive opinion upon it.

With respect to the University of Edinburgh, are you of opinion that there is practically much Constitution to be found in it?—So far as I am informed, I believe there is little; but it is pretty well known who are the Patrons of the offices, and in whom the right of nomination exists. As to the internal Discipline, I believe a great deal has been introduced without any unquestionable authority; and that certainly is to be lamented.

From what you know of this University, what should you recommend in the way of improvement in its discipline?—I cannot see that anything can really be wanted but good temper and good sense. I have not, however, turned my mind much to the subject. I think it would be extremely difficult to devise a code of positive laws and regulations for discipline, especially by one who was not an actual teacher in the University.

Do you think that it would be beneficial to vest the Principal with greater powers, such as superintendence of the discipline of the students?—If there is not a Rector who attends to that, I should think it would be his principal business to do it. I should, in that case, hold the office of Principal to embrace and include almost the Rectorial powers, which certainly are very considerable.

Ought not the Senatus Academicus itself to have considerable power over each individual Professor?—In the general way in which that is put, I should say, Yes, it ought to have authority; but, as I understand, it has authority.

Do you conceive that the Professors have the means of enforcing order, and of enforcing attendance upon their lectures, at present, as much as is desirable?—It is not proposed, I suppose, that they should enforce this by other than Academical penalties. As it is, I understand they can proceed to expulsion and suspension, in bad and flagrant cases of disobedience or want of attendance. I take it for granted they have that power. It is extremely difficult to vest them with power over the persons or property of the students, otherwise than by mere refusal of academical privileges and benefits, or the infliction of academical deprivations; but

University of Edinburgh.

F. Jeffrey, Esq., Advocate.

17 November 1826.

I think they must be merely academical. We used to hold, at Glasgow, that the Rector had the power of inflicting the punishment of imprisonment and bread and water. I was taught that when I held the office; but I never examined much into it, and certainly never dreamed of acting on it. I think the Court of Session would be apt very summarily to pass a bill of liberation to any person locked up in the apartments of this house, by the order of the Rector.

Are you acquainted with the principles at all, upon which the Professors grant or refuse certificates of attendance in their classes?—I am not practically acquainted with that; a very small part of my studies was prosecuted here; and it is so long ago, I forget. If they mean anything, I think they ought to be conscientiously granted or withheld.

In reference to so large a body of students as those at Edinburgh, might it not be advantageous that the Session should be opened with some degree of formality, and a statement of the general rules of the College, at the commencement of the session?—I am certainly of opinion, that, in general, here and elsewhere, there is a deficiency and want of solemnity and form in our Academical Institutions; and it is one of the means which I would suggest, both to increase the sense of duty and decorum, and also the value and dignity of the situation of the matriculated students, that there should be more of that, if it does not encroach upon higher interests.

Recollecting the rules by which the discipline at the University of Glasgow was carried on, the Commissioners will be glad to hear any suggestions you may have to offer, which might be applicable to this, or any other University, where the education is carried on solely by the system of lecturing?—I think all discipline which is effective, is maintained everywhere, more by a sort of traditional and fixed sense of decorum, and a certain spirit of forbearance on the one hand, and of decorous and dignified obedience on the other, than by force of any rules, upon the operation of which, immediately after their enactment, any reliance could be placed. The means of compulsion that are commonly resorted to in our Universities, of impositions and transcriptions, are really mere forms and trifles; it is the habitual and local duty of obedience that is really operative; and, as to Glasgow and other Universities, I cannot say that I ascribe much force, or suppose that there is much virtue in the imposition of twopenny and sixpenny fines, or even in the threat of detention half an hour longer in the class-room, or such paltry inflictions or threats, to which, however, the actual inflictions are confined in 99 cases out of 100. There are flagrant instances of contumacy and disobedience; and for these, as it seems to me, admonitions in the public hall, suspension from the benefit of education for a longer or shorter period, and ultimately expulsion, must, like the excommunications of the Church, be the *ultimum remedium* competent to Academical bodies, as such. Their means of enforcing discipline are but scanty and feeble in reality; and it is more by putting a dignified confidence in the lads themselves, and making them feel their place in the establishment as honourable, that their operation is ensured. It is my opinion, in short, that it is by the dignified conduct, gravity, and indulgent firmness of the masters, and by the general spirit of decorum and good sense which the better part of the youth will feel, and impress on others, more than the apprehension of those petty inflictions, that discipline in such bodies can ever be successfully maintained.

As graduation has become a matter of little value and importance in the Scotch Universities, do you think that it would be very desirable, with a view to the advancement of learning and science, that it should be raised in importance?—Certainly, I do.

What suggestion would you offer with a view to that object?—Why, upon that, and all the other important branches, I certainly have felt that it is much easier to point out the existence, and, in some measure, the causes of actual defects, than to suggest, with any confidence, any likely remedies. It is a little out of place, perhaps, as an answer to this question, but I must observe here, that the view I take of the importance of Academical degrees, depends very much, in my opinion, as to what are the radical defects in our Scotch system of Academic education generally. Now, my notion of that is (and everybody who has looked into other systems of education, I think, will agree with it), that the great peculiarity, and I would say, the great defect of our Academical system, is the trusting so exclusively, as it appears to do, to the mere oral recitation of lectures; not followed up, as it is in many other seminaries, by a constant and particular inspection of the student's progress, who there lives as it were in the family, and under the constant control of his superiors; nor by any such course of exercises and examinations as may bring to light the degree of proficiency that has been attained on the one hand, and, on the other, excite that emulation, without which no social studies will ever be carried on with spirit or success on the present system. The Professor necessarily goes on very much in the dark, and is consequently in danger of frequently leaving unimproved those capacities and faculties, for the improvement of which his labours are exclusively intended. The two great evils of trusting so entirely to oral instruction seem to be, on the one hand, that the teacher can never know with any certainty whether his instructions have taken effect or not, or whether what is said has been either attended to or understood; he wants, therefore, all means of ascertaining where he should repeat and enlarge, and render plain his instructions, where he is attended to, but not understood; and where he should render them more engaging and attractive, when they are not attended to, either from their own dulness, or from the pupil's neglect at his hours of teaching. In this way pupils and masters go on, without any intellectual contact or means of communication. There is merely a quantity of learning scattered over them; but whether it falls upon dry places, or slips off the rocky ones, is necessarily unknown; it is not seen whether the seed springs up and multiplies or not. That is one plain and palpable evil of the mode in which instruction is sought to be conveyed. There is an impossibility of knowing, therefore, whether a pupil is qualified to proceed from one branch or course of instruction to another; while, on a better plan, they might often abridge their course, by accommodating it to those differences which are found

433

University of Edinburgh.

F. Jeffrey, Esq., Advocate.

17 November 1826.

to exist among the recipients. The other bad consequence of that method is, that it affords no opportunities for that spirit of emulation among the youth themselves, without which, I fear, it is in vain to look for any great or distinguished attainments among persons in that condition, or indeed for that spirit of concern and interest in the business of instruction in other quarters. The master, it is well known, is excessively flattered and incited with the fame and celebrity of his favourite pupils; and the pupils, again, are all warmed and encouraged, even the dullest of them, by the spectacle of distinction and eminence obtained by those who have made unusual proficiency in their studies. This, I think, is the great desideratum. In many of the classes, and especially the most important ones, that immediately precede the finishing the Academical course, the whole of the instruction is trusted to that, to which it ought to be least intrusted. But, while I conceive these to be plain and undeniable evils, it is not easy to give practical suggestions for their redress, and especially to a body like this, whose business it is to discern, not how any one branch of knowledge may be best taught in the University, but what is feasible and practicable, with a view to all the branches which a liberal system of education should embrace, and with a view also to the means, in point of time and fortune, of the pupils and their parents, the period that can be spared from their lucrative occupations and necessary industry, in which many must be early engaged, for the prosecution of their intellectual training. One or two things have or may be suggested, though I am aware they are all obvious enough. And, should the Commissioners proceed to ask, what particular regulations should be enacted upon such suggestions, I must say distinctly, that I am not at all prepared to give even the outlines of any plan of it for actual adoption. The first thing I would say then, is, that there ought to be more Examination, undoubtedly, and more Exercises in writing: and along with those I would, as far as possible, combine a system of mutual instruction and control, by delegating to a certain proportion of the young men who had distinguished themselves by discretion and talent, some part in the inspection and tuition of their inferiors, by which a spirit of activity will be infused into the whole mass, and the power both of instruction and control be increased, and, as it were, multiplied far beyond its necessary limits, in the hands of a single master. On this point I can speak with more confidence, from being able to refer to my own experience of what was done in this way in the Logic class at Glasgow, more than thirty years ago, where this system of delegated and mutual instruction was completely established, long before Bell or Lancaster had been heard of, and, I believe, before it had been tried in any other institution. But there are no doubt practical objections to these examinations and exercises, the main one being that, from the great range of knowledge a well-educated man is supposed to be under the necessity of acquiring, and the length of time which is required to go through them, the thing could not be done without very much enlarging the time now devoted to each study, and so interfering with the practice of going on with several at once, and leading at once to a great prolongation of the Academical course, to the great inconvenience of persons who send children from a distance, and to the necessary delay of all, in entering upon the exercise of their profession, or whatever else they may have a dependence upon. The Commissioners certainly are not here to sketch out a scheme of education for noblemen and princes, to whom money is not at all an object, but to render, if possible, more extensively useful those establishments for general education, by which, perhaps, more than any thing else, this country has been so long distinguished. It must be their wish, undoubtedly, to continue them accessible to all ranks, and to persons of moderate circumstances. There is a difficulty, therefore, in these considerations: but, though what I am about to say probably will not be very popular either with teachers or learners, I think myself bound to state, that, without lengthening the general course of Academical Education, or the number of years required to complete it, I think the time spent every year in instruction should be enlarged; and chiefly for the purpose of making room for more exercises and examinations. If they cannot afford two hours a-day, one for examination and one for lecturing, they may surely afford two days in the week for examination only; and, if it be found impracticable to comprehend the proper number of lectures within the usual time, then let two months or six weeks be added to the session, and let the vacation be to that extent abridged, so that there may be—what I really conceive to be indispensable for the success of any system of lecturing—the means of letting the teacher know whether his pupils understand him, and of forcing them, by the dread of exposure, to take a chance at least of understanding him, by attending to what is going on. By this means the master would come with more spirit to the discharge of his duties, and would be constantly directed to improvements in the arrangement of his course, by finding out the avenues by which knowledge could be best insinuated into unwilling minds, and on what points his pains might be spared, and part of his labour dispensed with. This I really think is the main thing; and, with the help of multiplying exercises, and giving them over in some degree to the correction and remarks of the more advanced and more trustworthy of their own associates, I am convinced both that the general spirit of emulation and concern, in the higher part of the business, both of learning and teaching, may be communicated to the whole mass. This alone, I am persuaded, would make a great change; and, indeed, I may here again appeal to experience: I remember, with the greatest gratitude, the signal benefit I derived—and I may speak in this for most of my contemporaries—from our attendance on Mr. Jardine's class of Logic, the characteristic peculiarity of which consisted in the quantity of work that was required of us, and the constant interchange and mixture of teaching and learning among all the higher and more advanced pupils. There is nothing approaching to this in the system of education here. It would not be fair to say, the want of these things is owing to mere negligence or omission on the part of those by whom they might have been introduced; I believe it is rather owing to an opinion that there was no time for them in the present academical term, and perhaps still more to a feeling that the habits and temper of the place made this first introduction something difficult and hazardous: and cer-

University of Edinburgh.

F. Jeffrey, Esq., Advocate.

17 November 1826.

tainly no person of practical sense or judgment can fail to perceive that their success must depend in a great degree on their being administered to willing and prepared subjects; and on the actual existence of that sort of general spirit in the body which must be counted on in making regulations to give it scope and activity.

Is it so in the Philosophy classes generally at Glasgow?—I think it is: certainly it was in my time. I ought also to mention that another danger would be, that many clever young men, especially those of good condition and situation in life, who, with their quickness and the assistance of domestic tutors, were pretty independent of mere drudgery for themselves, would very probably, from the mere levity of spirit incident to youth, endeavour to throw ridicule upon those more humble and dutiful youths who were more under parental awe, and who, trusting to their obscure diligence, are aware that they had no chance but by plodding, would probably give the longest and most elaborate answers, and seek opportunities, perhaps not very judiciously, to distinguish themselves in the examinations. If, on this account, they came to be occupied with dull and formal responses, there would be great fear that the thing itself would become ridiculous and despised; and, in a popular body made up of very young persons, full of levity and presumption, and always ready to laugh at serious things, if such an opinion once took root, instead of being a good, I have no doubt that the practice of examining would turn out an evil; though, if it escaped these hazards, very many, even of the most frivolous, would derive substantial benefit from it. It would, therefore, be greatly to be lamented, if, by want of care in its introduction, or by any accident, it should fall out as I have imagined; and for this reason it certainly should be introduced gradually, and with great caution. The art of examination is not an easy art; and I think it ought to be confined, in the first part of the courses, to such examinations as tested the understanding and attention of the pupils, and should scarcely go farther than to ascertain that they knew and had listened to the lectures of the preceding days. All the Professors probably would not be fit to come at once into that unprepared conversational contact with their pupils, though capable, it may be, of delivering most eloquent discourses *ex cathedrâ*. The talent certainly is not possessed, and could not perhaps be attained, by every body; and according to the degree in which it exists, will the utility of the scheme be advanced or abated; and, in certain awkward though able hands, it might fail altogether, particularly in the larger classes, where the result would be watched with more anxiety than in the smaller bodies. I dare say, some who are here still remember what Mr. Miller's examinations were. He, undoubtedly, had the singular advantage of possessing, in an unrivalled degree, that intrepidity of intellect and facility of manner, with great tact and promptitude, which very few persons of his learning ever possessed, and also of having an extremely small class, with all of whom, therefore, he was personally acquainted, and in the habit of conversing; so that he could accommodate his questions to what he knew of the capacity of each individual respondent. Such a felicitous combination of circumstances is scarcely to be expected again; but I am quite sure that that kind of examination which goes to test the attention of the youth upon the lectures, and to help their apprehension by familiar explanations of what they may have misunderstood, would be of infinite use to the great proportion of students. The great danger at first will be either from overdoing it, or from a system of putting silly and frivolous questions, which can be answered by yes or no—or from any awkwardness or notable miscarriage, to give the least hold for that ridicule, which is so soon excited in an assemblage of youths, impatient of serious attention, and delighted with every opportunity of repaying to their teacher some of the grievances which they suppose he inflicts upon them. This last has always appeared to me one of the greatest hazards the system will have to encounter on its first introduction: but in itself I think it most important and feasible enough.

In order to make such a method effectual for particular purposes, do you think that in any University where it has not been practised, the introduction of it should be enjoined by authority, or left, on a general recommendation, to the discretion of the teachers?—As to authority I do not know what to say. But I rather think it should be required, to a certain extent, unless strong reasons could be given, in any particular case against it. The want of such examinations has been supplied in part, and might be supplied to a greater degree by the voluntary and meritorious associations of the students themselves, who form little societies for discussing questions which are suggested by the course of their studies. If these could be a little more confined, it would be better; but the spirit of youth is ambitious, and young men in the Humanity class will insist on discussing all the debateable points in History, in Politics, Physics, Metaphysics, and every thing. If they were to confine themselves to topics arising out of the lectures they attend,—though they should aspire at being eloquent and original, and at refuting the Professor if they could,—such associations would be a great auxiliary to him. Even as they are, they are an advantage; and I think they ought to be encouraged both by the Professors and by those too who have authority over the Professors. The debates exercise and quicken the mind; and the spirit of emulation is excited by those mutual exhibitions and conflicts, and this practical display of the effects of talent and industry. The same spirit, however, ought to be encouraged by other rewards and exhibitions; and this leads me to the question originally proposed about degrees, from which, I fear, I have wandered too far already. The way in which I think the restoration of the popularity and general use of these Academical honours would principally operate, would be by affording a more effective opportunity for ardour, competition, and the display of attainments, as well as for the detection of deficiencies, than any of the common exercises, enjoined weekly or daily, or even at the end of the session. In all these, when a young man thinks he may be idle, and yet redeem his time, they are not final, and attract no great share of notice. But if, before leaving the University, and after finishing his education, he has the option of going out with the stamp of academical glory or dishonour upon him, he can hardly feel indifferent about the result, and

4.35

University of Edinburgh.

F. Jeffrey, Esq., Advocate.

17 November 1826.

will probably be excited to these exertions, and by which alone it can be made favourable. In England, from its being so useful in all the professions, it has been long considered as the natural termination of every properly-educated young man's course of study, that he took the degree of Bachelor or Master of Arts before leaving the University. And if, in going into a profession or into society, it is asked, "Who is this?" it is to this day the most common and decisive answer, "I don't know, but he took a very good degree at Cambridge; or, he had the first honours at Oxford;"—or, on the other hand, "He was very idle at College—he tried for honours, but he was dull, and made nothing of it." For several years after a young man comes into society, either professional or fashionable, this is the most important thing that can be said of him, and goes farther than any thing else to fix the estimation of his talents. It was, accordingly, by catching at this critical point, that the great reformation which every one knows has taken place in the English Universities during the last twenty-five years, has been mainly effected. It was done chiefly by making a scale of honours, according to the extent of learning and accomplishment by which the degrees are obtained; and by this simple expedient they have excited a spirit of emulation, and diffused, even among the idle, and careless, and opulent, and independent of the youth that attend there, a habit of study, and a thirst for distinction, which could not have been anticipated by those who framed the regulations. That remarkable example furnishes a very strong motive for wishing to put ourselves in the same condition. But here again, though we can point out the defect, and see what is desirable, we find infinite difficulty in suggesting a practical remedy for the evil.

Would you approve of prolonging the duration of the regular course of study?—I certainly would say, that I think, for the preparation and instruction of a young person for a respectable situation in life, the time to make it complete ought not to be grudged. The two difficulties are, that you ought not to discourage persons from entering on their career, by making the course very long, as they may not have the means of following it out, and might not think of engaging in it, if they could not; and the longer you make it, the more you must discourage such persons. I admit, on the whole, the justice of the reproach which has been levelled against our general national instruction, namely, that though we have a greater number of all ranks, who possess considerable information, there are fewer who are completely learned—that our knowledge, in short, though more general, is more superficial than with our neighbours in England. That is quite true, and our system of education leads to it; but I think it is a great good upon the whole; for many of those who leave College very imperfectly instructed, supply the defects by their own study afterwards, in a manner they could not have done, but for that superficial training and initiation by their teachers. The possession of knowledge is a pleasure to every individual, however slight his smattering of it may be; it is a means of liberalizing his mind, and elevating his condition beyond what it would otherwise have been; I should be sorry, therefore, to have any thing so rigorous in any prescribed scheme of instruction, as at all to deter people from getting—not indeed profound learning, for that is not to be spoken of—but that knowledge which tends to liberalize and make intelligent the mass of our population, more than any thing else. With that view I would prefer increasing the quantity of attendance every year, to adding a longer period of years to the course of study; both, however, may perhaps be necessary; I have not considered the details. As to the means of rendering degrees desirable, it is also difficult to do this, without infringing on that principle of free competition, which is of still more value than good academical regulations. If these were all in all, it would be easy to enact that no man shall come to the bar, or practise Medicine, or have a presentation to a Church, who had not taken his Master's degree; or even that no person should be a Member of Parliament, or a Justice of Peace, who is not so qualified: if you merely want regulations, you may easily make and enforce them; but you may thus touch something still more vital than academic education—the freedom of industry and ambition. A man may want some of those branches of learning that are necessary for obtaining a degree; and yet he may have others which enable him to rise to the very top of a liberal profession, from which, by such regulations, he would be excluded, and the country deprived of the benefits of his genius and fame. There are many such instances of persons self-taught, late-taught, home-taught, who, in their youth, had neither the means of getting a degree, nor the learning to entitle them to it. It is a public evil to narrow the practical competitions of talent and industry, by requiring antecedent distinctions; and I should be shy, therefore, of introducing any measure that would have that effect. There is another thing, however, which may certainly be tried with good hope of success—I mean investing the Academical degree with a little more splendour and solemnity, talking of it more reverently, and having it bestowed with more pomp, and earned by a more public competition. I think a good deal may be fairly expected from such competitions, always taking into view that the youth have been previously prepared for them, by the habit of these examinations, to which I have already alluded. If the whole mass of the University could be made to feel the importance of them, clever young men would look to the end of their course with more interest than they can do at present—to the grand result of their studies in the great *arena*, before the whole convocation, when the degree was given with or without honours. I am for allowing degrees to be got by ordinary acquirements and attendance, reserving the honorary distinctions for those who have gone beyond this, and deserved them by remarkable diligence or talent. I think that every thing should be done which can give publicity and honour to that competition, by the attendance of persons of note and eminence, and by a general attempt to excite interest in the community, and also by considerable vigour in the examinations themselves, especially of those who were competitors for the honorary accompaniments of the degree.

Supposing a distinction to be made between an ordinary degree, and a degree taken with more honour and publicity, do you think that the hardship of enforcing a degree, in some

University of Edinburgh.

F. Jeffrey, Esq., Advocate.

17 November 1826.

cases, would be so great as you seem to have considered, in some of your observations?—Where there is already an established usage, I would make a distinction. For instance, in the Medical Profession, where we know there are now very strict examinations before the degree of Doctor is given, I do not think it would be felt as a grievance, if a previous Graduation as Master of Arts were required. I do not know much of the practice, but I believe the Medical student is now obliged to pass through an Academical course, besides his professional studies; and those who take the higher degree should not complain of passing to it by gradations, and taking the Master's degree first. Again, in the Church, for instance, the same observation might apply. The students in that department must pass examinations, both in the Divinity Hall, before they get their certificate, and also before the Presbytery, before they enter upon the exercise of their profession; and must then produce certificates of academical attendance; and, therefore, I do not see any objection to require proof, in the shape of a Master's degree, that theirs had been profitable attendance; for mere bodily presence at the lectures, if they went with wax in their ears, and lead in their hearts, should be no title to admission into the Church, or anywhere else; but their having got a previous degree, on examinations, would imply that they had profited by their attendance.

As one great advantage, attached to the degree in England, arises from people entering more advantageously into professions, would it not be well, if some such advantage could be given to it in this country?—I think it would be more difficult, than may at first sight appear. The advantage would be confined to those who were to follow professions; and, from the smaller extent of society, and the greater poverty of our nation, professions are not, on the whole, quite so honourable in this country, as in England. The Church, for example, ought to rank very high, and, from the merit of its members, it does so; but it is not a profession which raises one so high in society as in England, where persons of great birth and fortune enter into it in great numbers. The danger, therefore, would be, if you raised the qualifications for taking degrees too much, that the more opulent, aspiring, and independent part of the youth, who naturally give the *ton* to the rest, might come to look on those who took their degrees, as persons of an inferior caste, and who were compelled to that measure, merely to better their means of future subsistence, and that the thing itself might thus be considered as ignoble, so that few would be excited to seek the distinction voluntarily, or out of a generous emulation. I think it most important, that there should be such a spirit of emulation kept up, which I look upon as the vital spring of improvement; and you should therefore be particularly cautious that no aristocratical idea should counterwork your plans for exciting it—and that those who were complying with your regulations should not figure, in the eyes of their associates, as in any way inferior to the more daring transgressors of their duty.

With reference to the Bar in this country, is it not the fact, that the Faculty of Advocates require no previous education, and not even a certificate of attendance on the Law Classes in the University, and that all that is required, is the ability to go through an examination?—Which examination is a farce. I really forget what the present law is. At one time, certainly, certificates of attendance at the University were required; but there have been late changes, and, I believe, some disagreement between the views of the Court and of the Faculty, as to the extent of the requisite attendance, so that the matter now stands without any definitive or fixed regulation. I think it reasonable enough that something should be required; at the same time, if I were to legislate, or even give an opinion upon it, I should be a little averse to say, that a degree should be indispensable, especially as we do not yet know what may be required to obtain it,—I mean what *Curriculum*, or course of study, should be absolutely required. I am unwilling to impose new trammels upon the freedom of professional competition, and especially for the mere benefit of their reaction in improving Academic instruction. I think such a test is not wanted to maintain the dignity of our profession. Where there is such an *esprit de corps*, as exists in such a body of gentlemen and well instructed persons, the intrusion of uneducated and unqualified persons can only terminate in their own disgrace, and cannot contaminate the general body; and this indeed is the case, I take it, in all liberal professions. I should hardly think it necessary, therefore, and perhaps not quite safe.

Is there not a risk, if something be not done to settle the point, which appears now to be in abeyance, that the *esprit de corps*, to which you have adverted, must degenerate a little, and the standard of literary and scientific attainments become lower than you would wish to see it in so learned a body?—I scarcely think that a probable consequence at present; at the same time, I wish it certainly to be understood, that I conceive it to be no hardship, but very right, that such attainments in literature, generally, should be required from all persons entering that profession, as the ordinary attendance upon a course of Academical education would bestow; but, in the present state of freedom, I am not sure that I should insist upon having the test of its being possessed exclusively in the shape of a degree, and, perhaps, not entirely by requiring a full series of Academical certificates. I think there is a doubt about that. At the same time, if the degree could be obtained without any very extraordinary attainments, or very long course of study, perhaps it might not be unreasonable that it should be required.

Without absolutely rendering a degree imperative, would it not be a great encouragement to literature, if it were understood that no man could pretend to enter the Faculty of Advocates, who had not had such previous education as, upon mature deliberation, that body thought ought to be necessary to entitle a person to enter?—Undoubtedly. I do not know that I should object to requiring considerable proof, by certificates, of Academical attendance. The only evil is, that by a course of private education and study, the same learning might be obtained; and by refusing the privilege to those who got the same thing in another way, a disadvantage would be imposed, perhaps without an equivalent benefit. I do not believe the Faculty, or any proportion of them, ever hesitated about the propriety of requiring some Academical education in those who are candidates for admission into their body.

F. Jeffrey, Esq., Advocate.

17 November 1826.

Have you any suggestions to offer, as to privileges within the University, to be given to Graduates, which might tend to encourage the taking of degrees, and to raise their value?—I certainly think, that all the privileges which can be conferred, should be given for that purpose; but at the same time, except so far as they resolve into elective franchises, or the capacity of holding certain offices of honour and dignity, it is difficult to see what sort of privileges they can obtain, their course of education being finished in a great degree before they graduate. Certainly, if access to the Library and the Collections in the University is held of value, it ought to be given. At the same time, with the exception of those who mean to follow out a further course of study, a large portion of those who take degrees, no longer reside at the University; and privileges would therefore be of little use, except upon the occasion of an election. For Medical and Theological students, I think all those facilities and encouragements ought to be given in the amplest terms.

With respect to the office of Chancellor and of Rector, if the Degrees were to be taken in the way which you have suggested, do you see any objection to vesting the right of electing those officers in the Graduates of the University, instead of being nominated by the Crown, though subject to the royal approbation, or not, as may be thought best?—That is a point of some importance, with a view to what has been already stated. I am rather for making the election of *Rector* more popular; and I doubt if it should be confined to Graduates. The other office, of *Chancellor*, being higher, and more permanent, should be trusted to a body, though popular, yet smaller and more mature in its judgment.

Would you suggest any alteration as to the time for which the Rector should be chosen?—It did occur to me that the time might be prolonged with some advantage. The election, I understand, is now annual in almost all the Universities; and they cannot hold the office for more than two years together. I think it would be of advantage, especially if it is to be conducted on a very popular footing, that it should not be so frequent. I think, perhaps, three or four years would be a good term.

Looking also with the same view to Graduation, has anything occurred to you with regard to the course of study, or the order in which the classes should be taken?—Really, not much. I formerly considered that a little, but I cannot say that I have thought about it lately. Thus much, however, I would say, generally, from recollection of my former speculations: I should rather think, that the Speculative Sciences ought to be more uniformly postponed to the Practical Sciences than they now are. I should rather think the classes of Mathematical and Physical knowledge should be attended earlier, and perhaps in schools, preparatory to the University, as giving simple elementary knowledge, the application of which to the Speculative Sciences, and in their general bearings, might be reserved for the Colleges. I know there is a difficulty, from the natural growth and expansion of all great subjects, in the progressive improvement of learning over the world, and from the ambition of particular persons, leading them to trench a good deal upon each other's boundaries—which I, for one, do not consider as an evil. I think it is rather an advantage that a part of the same subject, for instance, should be discussed by the Professors of Chemistry, Natural History, and Natural Philosophy. I think it is an advantage, from the very causes which led to that mutual invasion of each other's territories. Every one is not equally learned, or equally zealous, on all the branches of a great subject, and he dilates upon those on which he feels strongest. It is likely the subject will be more completely elucidated by having a number of its general topics looked at under different aspects; and by some being mutually left to the known superior intelligence of a particular Professor, who, on account of his greater knowledge of certain branches, is allowed, in a good degree, to appropriate them to himself. The same may be said with regard, perhaps, to the Ethic and Logic classes, in which I do not think there is any harm in having a good deal of undivided territory common to both, and which, from its barren nature, requires more cultivation and labour than a single master would be able to bestow upon it.

Which of those two latter classes would you put first?—That is one of the nice points, and certainly there is nothing more absurd than, in modern times, to follow the old notion of Logic being the key to all the other sciences; and therefore, as teaching you the use of your faculties, to be studied in the beginning of education. It is true the persons who *regulate* the course of study should be acquainted with Logic before they prescribe any order of teaching; but as to the student, it is quite useless for him to know the recondite process by which his own mind is to be exercised or developed; he is a mere patient, and is to be acted upon. As to him, the old scholastic method was absurd enough at any time; but it is still more absurd now, when all the sciences are taught by persons of competent skill, to say you must have a thorough knowledge of the rules of reasoning and of logical induction before you can be safely intrusted to study anything else. It is not as if a young man were turned, without guidance or control, into a great library, or to an Encyclopædia, and left to pick up all kinds of knowledge at random. There, to be sure, a logical preparation would be necessary, to enable him to digest that chaos. But his intellectual food is now all dressed and cooked, and served up in orderly courses, and there are dishes and sauces of all kinds carefully prepared, with the preparation or arrangement of which he is not trusted, or encumbered. The old notion, therefore, of *beginning* with Aristotle and syllogisms was quite absurd; and I think there is no very good reason even to take Logic before Ethics. Indeed, if it were a purely Ethical course, or if a material part of it were occupied with practical Ethics, I should be for preferring Logic; but as it practically embraces the elementary principles of Law, of Jurisprudence, and of Politics, as well as a great deal of abstract Metaphysics, perhaps it is better that the established order should be continued, and the science that teaches not only the principles, but their chief applications, reserved till after that which deals only with principles.

University of Edinburgh.

F. Jeffrey, Esq., Advocate.

17 November 1826.

Do you see any material practical evil likely to result from preserving the order of these two classes as it stands?—On the contrary, I rather think it is right.

Do you think that Natural Philosophy should follow rather than precede them?—I rather think it should precede: I think all sciences conversant with matter are chiefly valuable, as supplying the furniture of the mind; and though some of them are higher in degree, they are in this respect akin to Natural History, in which facts and phenomena are simply recorded, and little reasoning employed, or intellectual activity excited.

Might Natural History precede them?—I would say, certainly; I think Natural History might be learned without anything at all beforehand.

Do you see any other subject for which you would think it expedient to institute a separate Professorship in Arts or Philosophy?—Why, it is not very easy to answer that question. If a man's life could be spent in making himself as learned as possible, or even if education could be continued to 25 or 30 years of age, it would probably be advantageous to have a multiplication of classes, and that to a very great extent—if the object was to make all the people, as in *Laputa*, philosophers together. But in a country where *work* must be done, perhaps, on the whole, the classes are numerous enough, if ably taught, by persons capable of meeting the growing demand for knowledge in the world. I think, that from the existing Chairs in this University, such Professors might teach almost all that is to be learned. There is, however, one exception, I mean the establishment of a Professorship of Political Economy. I have been long of opinion that this is a very fit, and, now-a-day's, almost necessary branch in a complete education. Its doctrines are at once so complicated, and in many points so nice and delicate, as not to be easily mastered by an ordinary youth by merely reading the common books on the subject without some help from a teacher; and, at the same time, so truly scientific in their principles, and connected with so large a range of important topics, both practical and speculative, as plainly to furnish materials ample and dignified enough for an Academical Chair. In comparing it with some which have been actually established at Edinburgh, I think it impossible to doubt that it has higher pretensions every way than Agriculture, for instance, or Medical Jurisprudence.

If there were a Degree in Arts, would you think it proper to make attendance upon such a class imperative. or would the *Curriculum*, as it now stands, be sufficient?—I confess I should hesitate about adding it; for persons who are to follow the learned professions, and for whom Academical honours are chiefly intended, it certainly is not necessary. It is not requisite for a person following the Medical, or the Theological, or the Legal profession, though, in the latter, it may be occasionally useful. But it is not the less necessary for gentlemen, legislators, merchants, magistrates, and generally for all those whom it most concerns the public to have well educated.

Was it not the practice of Professor Stewart to teach a class of Political Economy?—I can hardly call it a *practice;* he taught it, but not regularly. I forget whether he delivered more than two courses. It was not more than two or three, I am pretty sure. Certainly it was not a regular part of his academical course, and was not introduced at all till a very great portion of his incumbency had elapsed.

Does it not fall within the province of the Professor of Moral Philosophy to give instruction in the science of Political Economy?—It is not easy to say what is absolutely out of his province. In all practical applications of general reasoning there is a certain contingency, undoubtedly, with the doctrines and fundamental principles which it is his business to develope; and I suppose it is from its affinity to those subjects that it has been occasionally taught from that Chair. It is so taught at Glasgow, and, I believe, somewhere else; at the same time, it is taught separately at the East India Company's College, and a Chair has been lately erected for it at Oxford. I should be very unwilling to see any disputes raised about any alleged encroachment by new Professors upon the provinces of others. That has never been held a reason for not establishing new Professorships here, where, indeed, they have almost all germinated and expanded from a few radical ones, originally embracing all the matters that are now exhibited in separate Chairs. Wherever a scion of this kind, though visibly reared from its parent stem, has acquired such vigour as to encumber that stem, rather than derive nourishment from it, if it appear worth cultivating by itself, I think the practice has been (and it is a laudable one) to detach and plant it out in a separate Chair. The only question, I think, would be, whether the Professor of Ethics could say that such a measure would leave him with an insufficient province of his own. Even if it encroached upon a *part* of what he had formerly occupied, I should think that no good ground of objection. The Professors of Chemistry, Botany, and Natural History, all encroach upon each other's provinces, and in my opinion to their mutual advantage.

Supposing the Professor of Moral Philosophy were to think it his duty, as belonging to the general subject of study committed to him, to give separate lectures upon Political Economy, do you then think it necessary to establish a new Professorship in the University, seeing that there are so many already?—A good deal would depend upon the qualifications of the individual Professor, and the success of the experiment. I conceive there are men, probably at this moment, certainly I think there have been persons in the Ethical Chairs in the Universities of Scotland, quite competent to do that, and even more. I do not believe, if the hours of attendance had not interfered, that Mr. Stewart was not competent to have taught at once the Mathematical, the Ethical, the Logical, and the Political Economy classes, supposing them to have been all separate classes. I have no doubt of his competency. I have no doubt Dr. Adam Smith was competent to teach Political Economy as well as Ethics, of which he was the regular Professor, when he laid the foundations, in a manner, of the other new science in his immortal work. But I am afraid the principle which so justly condemns pluralities in these

439

University of Edinburgh.

F. Jeffrey, Esq., Advocate.

17 November 1826.

departments, would be conclusive against the encouragement of experiments that could only succeed under extraordinary circumstances. You ought not to make it the duty of a Professor of Ethics also to give a separate course of Political Economy, both because you would task too hardly the average talents and abilities of persons fit enough to be promoted to that particular Chair, and expose the greater proportion of those who actually filled it, to the risk of starving both classes of pupils in the attempt to serve both. I think it must appear to all who are competent to judge, that the subjects are each of them of magnitude enough to require to be taught in separate classes, and by separate courses. But if that be the case, I see no more safety, and certainly no more advantage, in having them delivered by one Professor than in having any other two branches taught by one individual. You may teach Chemistry by the same person who teaches Greek. If the individual is eminently skilled in both, there would be no practical objection to it; but certainly it ought not to be enjoined, nor, I think, upon general principles, permitted; and if it be once conceded, that there is magnitude and importance enough in the subjects to require two separate courses of lectures, I cannot say that the mere accident of the recency of the one science, or its having been grafted upon, or arisen out of the other, is any reason for continuing the identity of the teacher.

Is there not considerable affinity between the science of Moral Philosophy and the science of Political Economy, and have they not been generally taught from the same Chair?—There *is* an affinity, though, I think, a very remote one; but then there are so many separate details peculiar to Political Economy, as to render the general philosophical preparation of the mind taught in the Ethical Chair really of no practical avail for the advancement of that course. I do not think the Professor of Political Economy will have occasion, in the fullest course he could give, once to refer back to, much less to repeat any part of the peculiar doctrines which are now delivered from the Chair of Ethics; and certainly the Ethical Professor does not now enter at all into the reasonings and details that make up the science of Political Economy.

The Commissioners are desirous of knowing what you have thought with respect to the Greek class as taught in this University?—Certainly it would be an improvement in the course of education, that the students should carry away more Greek with them when they leave College; and I do not see how that can well be done, without requiring that they should bring some to it. I do not think it is a fit thing that a very large proportion of the lads matriculated here in a regular University should be learning the alphabet of a particular language. I do not see that that is a proper employment of an Academical course, so long as there is a distinction between schools and Universities. The mere initiation into the elementary knowledge of a tongue, disconnected from all study of philosophy, antiquities, or criticism, can scarcely be regarded as a part of those more advanced studies to which Universities are understood to be dedicated. That is the proper business of preparatory schools; and I have always been of opinion that it ought to be required, in all great towns at least, as a qualification in the teachers of such establishments. I think such a proportion of Greek should be required from students entering an University as is now required of Latin. Perhaps not absolutely so much, as the language is more difficult; and therefore, even at College, there should be more reading in the Greek class. But to turn a great room in an ancient University into a mere school, in which children are set to spell their Alphabeta, seems quite an abuse of the nature of the institution. The disadvantage of the present practice is not so much that it exhibits a great number of young boys employed in a kind of work unsuitable to the place where it is carried on, but that unless you prolong the term of Greek study for two or three years, it necessarily ends too soon, and they ultimately leave their Greek teachers just at the part where they ought to have begun. With all due respect to the teachers, it is impossible, in so short a time, and with such numerous classes, to give anything but a smattering to the far greater number. At Glasgow there are 400 in the Greek class; nothing, certainly, can be better taught than that class now is by Mr. Sandford; and nobody was more distinguished for his zeal and talents than his predecessor Mr. Young; yet I am afraid it must be admitted, that out of these 300 or 400, there are not above 50 who can read the Gospels in Greek at the end of the course. Some few may be able to read difficult books, and even to write themes and verbs in that language; but these are a few ambitious and clever lads, who have probably been helped at home, and have made extraordinary progress. A single hour a-day, or even two hours bestowed in teaching the very elements, and in so large a class, is quite inadequate to give a proper knowledge of that matchless language, which ought to be taught in such a place, not merely as the Greek tongue, but as a part of the literature and polite learning of Greece.

Would it then be advisable, in your opinion, to require an increased knowledge of Greek, before coming to the University?—That is the only remedy.

Has it occurred to you to consider how the difficulties that might arise if that class, where it is the practice to learn the elements of Greek, were put an end to, might be remedied?—I do not think the difficulty would be great. In great towns, and indeed I have no doubt in every considerable town, the established schools might be easily provided (with very little additional charge to parents) with the means of teaching as much Greek as is necessary for entering the University. No doubt one feels, that to some classes of students, and to families who are less prosperous in worldly circumstances, this might be a burden. But I suspect the greater part of the pupils, even in the humbler ranks of society, who have generally a long career before them, will be found to live within a reasonably short distance of some considerable town, where a school of some magnitude is established; and it would be an encouragement for the increase of such schools, even in the smaller towns, if there was poured into them that degree of patronage which is now absorbed by the first Greek classes in the Universities. It would be an encouragement to persons to apply for the office of teachers. On the whole, my opinion has always been, that longer attendance on this branch of study, in some seminary or other, is

University of Edinburgh.

F. Jeffrey, Esq., Advocate.

17 November 1826.

indispensably necessary. I am also of opinion that it is of no use to teach Greek by a *Latin* Grammar; the languages should be taught simultaneously.

You think, then, that the system of teaching Greek by Latin is not a good system, and that it would be better to teach Greek by English?—From what I have stated it must appear that I think so. I see no advantage whatever in tempting a boy to parrot one language, in order that he may escape being detected to know nothing of another. I know it often happens that a boy pretends to translate a Greek word by a Latin one, when he has not the least idea of the meaning of either: but this could not happen if he were obliged to translate it into English. If a boy really happens to know Latin well, before he begins Greek, there can be no harm in his keeping up his knowledge of Latin, by rendering the Greek he acquires into that tongue; and the constant comparison of the genius of the two languages may lay the foundation for a philosophical taste. But, in the common case, this very erudite way of proceeding is far worse than useless.

Do you conceive that the instruction which ought to be conveyed in the Greek and Latin classes is a good foundation for a liberal education?—Yes, I think so; I should be averse to enter into any question now as to the real utility of classical learning, upon the whole. From the habits of learned Europe for several centuries, it has been advanced into a state of importance, beyond what its intrinsic merit and real utility, perhaps, entitled it to. From the habits of society, however, as well as of the learned of Europe, and especially with the additions that have been lately engrafted on that kind of learning, in all good seminaries, I cannot say I feel very anxious to disturb the place that classical scholarship now holds, as the token of a good education. It has its advantages; though there may be disadvantages also. But, undoubtedly, it is drivelled on with too long, and might be got over much faster.

Do you not think that the language is made too difficult of attainment, by the manner in which it is taught?—It is taught too slow, I am quite satisfied; I think the manner of teaching languages in the elementary schools is generally much too tedious; they need not occupy half the time they do.

Have you any peculiar views in regard to such a class as that of Civil History, or the Law of Nature and of Nations?—My views are so far peculiar, that I think the fate of those classes in this University constitutes a very valuable monition to any presumptuous anticipations one might form of the necessity of new classes, or of the likelihood of great success from experiments of that kind. Certainly, but for the experience we have had, one would have been apt to say that both of these classes, and more especially that of Civil History, would have been among the most pleasing and attractive, as well as the most useful of those that belong to general information; yet these have both absolutely failed; and certainly I may say, without the idea of flattering any body, failed in the hands of eminent and accomplished persons. The class of Public Law was at one time thought the most important, perhaps, of all branches of liberal instruction; and every body knows, that for a century after the time of Grotius, it attracted more notice than any other part of philosophy. It was taught, too, by a succession of able persons in this University,—among others, by the late Lord Meadowbank, than whom no man was more full of discursive knowledge and originality; yet in his hands, as well as those of his successors, it proved, in practice, a complete failure; so that they could hardly get through the course with a larger attendance than is now around the table of the Commissioners. I had the benefit of attending Civil History when it was in the hands of the late Lord Woodhouselee; and though not so profound or philosophical a course as the other, it was one of great information, very gracefully composed, and delivered in a singularly attractive manner. I attended it in one of its best years, and yet we had not more than thirty on the list; and on a snowy day at the end of the session not above a dozen. I can only say that these are wholesome admonitions to the vanity and presumption with which inexperienced and theoretical persons often venture to predict the wonderful advantages to be derived from untried institutions. I ought, however, to add, that I still think, that in the hands of a person of singular talent, and of some celebrity, (for, after the sort of lethargy into which it has fallen, that would be requisite,) who felt a disposition to consult the taste of the times in the selection of the topics which a class of Civil History would afford to a man properly qualified, in spite of what we have seen, it might be raised into a class of great attraction and popularity; and I think I could name two or three individual men, at least, who, if their other avocations admitted, could still invest that Chair with very great attractions, and make it extremely popular and useful.

In reference to the practice of Lecturing, by which the Academical education of Scotland is chiefly distinguished, does it appear to you, on the whole, that it would be better that a Professor should confine himself to the delivery of prelections carefully prepared, or that he should endeavour to form the habit of extempore speaking, that he might better accommodate himself to the attainments as well as the defects of his hearers?—I would almost answer with the common reply of children, that I think *both* are best. A great deal, no doubt, must depend on the ability of the individual Professor; but I must say, upon the whole, if there were other meetings for the purpose of examinations, and that kind of interspersed instruction that would arise out of them, it would be safer to require the more elaborate preparation of written lectures, in which the Professor would be forced to be more condensed in his observations, and would have the opportunity of seeing any errors into which he fell, or avoid any imperfection which he discovered on revisal; though there are persons of exact thinking, prompt eloquence, and good memory, who might be trusted with *vivâ voce* speaking; but I am sure, (as the Commissioners must have felt very powerfully to-day,) that *vivâ voce* speaking is exceedingly apt to run into greater length, and to be more diffuse and tautologous than writing, by the same person, would ever be. If you want the *optimum maximum* of the *beau ideal* of a Professor,

I would say, that they should write their lectures with a presentiment that they were to be spoken, and speak them, so that they may appear rather like extemporary and animated discourses. If the Professor had these intermediate examinations and occasions of colloquy with his class, which I have suggested, he would very soon get sufficiently into the habit of extemporary explanation. Mr. Miller, I believe, wrote his lectures, or had the heads of them, at least, in his book; but he seldom looked at it, and in fact he spoke them all.

University of Edinburgh.

F. Jeffrey, Esq., Advocate.

17 November 1826.

Edinburgh, Monday, 20th November 1826.

The Right Honourable LORD BINNING in the Chair.

Thomas Thomson, Esq., Advocate, called in and examined.

T. Thomson, Esq., Advocate.

20 November 1826.

Having, at your own desire, heard the statement which was made by Mr. Jeffrey on Friday last, do you concur generally in the opinions which he stated?—I think in a great proportion of his opinions I feel myself disposed to concur, without much qualification. I do not know that I should say I concur in all of them literally, or to the full extent. Generally, I should say I felt very much disposed to concur in the greater part of what he stated, with some modifications.

The Commissioners are desirous of hearing any suggestions which you may have to offer, taking them either in the order in which Mr. Jeffrey made his observations, or in any other that may be more agreeable to yourself.—I think the examination of Mr. Jeffrey began by some questions as to the constitution of the Scottish Universities, and particularly in reference to that of Edinburgh, which is certainly in many respects peculiar. At present, in this University, there is the want of a fixed, or, at least, a very intelligible constitution. I think the great misfortune of the University of Edinburgh in that respect has been, that while it was created a University, with privileges similar to those of other Universities in Scotland, its powers as a Corporation were never so clearly defined. They flowed immediately from those persons who were the donees of the Crown, and who became the Patrons and Founders of the University; and it does not appear that there ever was a disposition on the part of the Founders, nor, perhaps, was it considered a matter of expediency, that they, or any others, should define what the powers of the Corporation, and its privileges and franchises, were to be. Upon that subject it is highly desirable something more explicit should be established, than has hitherto been understood. I confess I think that what may be called the primary regulation of the University, in the first instance, would be tolerably well vested in the Senatus Academicus; but certainly not without some control in some other quarter. The question will remain, if that control ought to be vested in those persons in whom the principal patronage of the University is vested, and who have truly assumed the title of the Founders of the University; or, whether it ought to be vested in a portion of them, combined with some other class of persons, who may be supposed qualified to control any misdirection of the Senatus Academicus, in matters connected with scientific regulation. Upon that subject a question was put to Mr. Jeffrey as to the propriety of having an officer put at the head of the University, to be called a Chancellor. I confess I concur in thinking with Mr. Jeffrey, that an officer of considerable rank under some such title might be highly useful. He might be considered as the centre, in some measure, of the chief Academical Court, to which points of doubt, either in matters of discipline, or in questions arising among the Professors themselves, or between the Professors and students,—to which matters of that kind might ultimately be referred, supposing the original directions of the Senatus Academicus were not acquiesced in.

Do you concur in thinking that this office of Chancellor, if it were to be created, ought to have Assessors?—I do, certainly; but I differ from Mr. Jeffrey in one respect. He seemed to think the persons whom we have called the Patrons of the University ought not to form any part of that Court. I cannot concur exactly in that. I think the Town of Edinburgh have a feeling of interest in the University, which would make it highly fit that a certain portion of the Magistracy should form a part of the Chancellor's Visitatorial Court; and it would be an improvement in the system, if these Assessors were appointed, perhaps, in two or three different ways; that a certain portion should be official persons of rank, and perhaps that a certain proportion should be appointed by the Chancellor himself. It has been a matter of consideration with me, whether somewhat like an Academical election of a certain portion might not infuse into the whole University a degree of spirit, and a feeling of confidence, which would be desirable in the constitution of a Court of this kind.

When you propose that part of that Court should be elected by some body besides the Chancellor, do you mean that it should be by the Senatus Academicus, for instance?—I should wish to make it more extensive than that. I think that the more advanced class of students in the University, and graduates, might perhaps, without any impropriety, be permittted to concur in an election of that sort; not so much with a view to secure the best possible selection, as to give importance to Academical degrees in Arts, which is much wanted, so as to have consequence, and importance, and splendour attached to literary degrees in the department of the Arts. That is the crude and general view that occurred to me. I do not differ materially from Mr. Jeffrey, except in thinking that the Patrons of the University—some portion of them—should make an essential ingredient of that Visitatorial Court, if it ever were to be constituted.

When you speak of the election of a part of that Court by graduates, or advanced students of some order or other, would you include in that right of election, the privilege of voting for the appointment of the Chancellor?—I think it would be highly expedient, I confess; but I am aware serious objections might be started to the measure. I think it is of great importance that the Chancellor should be a person of considerable rank and high respectability in

University of Edinburgh.

T. Thomson, Esq., Advocate.

20 November 1826.

the country. He should not merely be a person of political or personal celebrity, but a person whose general station and influence in the country would secure a pretty fair chance of cool, and what I would call responsible deliberation on the part of his Assessors.

Would you propose that he should be elected for life, or for a fixed number of years?—In that I rather think Mr. Jeffrey is right. I think a certain number of years, five or seven, or any moderate number, would probably secure against a person holding that office in extreme old age. It is one of those situations in which a man ought to be very much a member of the world generally, to discharge the duties of it with effect and advantage: and certainly, in the way he suggested of making the election of the Chancellor, and some portion of his Assessors, connected with Academical honours, it would be very inexpedient to prolong that election beyond a moderate period. I do not say every person who came here should, during his attendance in College, have an opportunity of voting for a Chancellor; but, according to my view of it, both in the election of a Chancellor and his Assessors, and that of Rector, I should say, that not only persons who have advanced to a certain point towards graduation, and who were in attendance at the University at the time, should be entitled to vote, but that those who had ceased to attend, and who had completed their graduation, should retain that privilege during life. I would suggest that they should continue to hold the privilege after quitting the University, but with honourable degrees, in order to meet the difficulty there might be of individuals having attended the University, without having had the opportunity of exercising their elective franchise.

Supposing the office should be held for a fixed term of years only, and not for life, would you make the same person eligible a second time?—I confess I see no objection to that; he certainly is not likely to be elected a second time, unless he has discharged that duty with a considerable degree of public approbation; and if he has, I think his continuance in his situation would, upon the whole, be rather a desirable than an inexpedient measure. But that of course would be merely a power of re-election, and not, as in the case of a Rector, a regular matter of routine that a re-election should take place.

Taking into your consideration the existing state of the degree in Arts in this University, and also that it might take some time before a respectable constituent body of that description could be found, should you not think it better that, in the first instance, the Chancellor should be nominated by the Crown, or by some authority unconnected with the University?—In the present state of the University, it cannot be said to be in a fit condition to proceed to an election of that sort; therefore some measure of the kind that is now suggested would be almost indispensable. There does not exist in this University anybody in the class of graduates, except Medical students, who appear to me to have the slightest pretensions, on that score at least, to any elective franchise, or any distinguished privilege.

Would it be obviously inexpedient to leave the election of that officer in the hands of the Medical graduates?—Of all things it would be very inexpedient to commit that office to the election of any one class of professional men; not that medical students, for instance, are more objectionable than any other particular class, if acting entirely by themselves, might be held to be.

With reference to what you have stated as to the propriety of allowing the Patrons of the University to have some share of influence in this Court of Review, have you taken into consideration the possibility of acts and deeds, and pretensions of theirs coming before that Court?—Certainly.

Should you not think that would form an objection to their having any thing to do with it?—Not a very strong one. If you were to give them a predominancy in the body, it would be an insuperable one; but the circumstance of forming a part of that body only, would tend to mitigate and qualify their pretensions as a class of persons, and would avoid a great deal of what I may call a natural degree of exasperation on the part of the Patrons, who, according to this plan, are to be ousted of what they have regarded as their exclusive rights.

With regard to the effect to be given to the deliberations of the proposed Court of Assessors, with such an officer as the Chancellor of the University, would you propose that he should be bound to act according to the opinions of the Assessors, or that they should be considered merely as tendering advice, leaving it to the control of public opinion to induce him to act upon that advice, as circumstances might appear to him to dictate?—The opinion I have given implied, that he should act according to the advice of his Assessors, by a majority, I suppose, as in most other cases of that sort. At the same time, I perfectly agree in thinking, that there is a great deal of delicacy in that question; and I should be very presumptuous in saying I had considered the matter so deliberately or maturely, as to dare to give a positive answer, that such an arrangement might not be proper. To give effect to this Court, and to give it respectability, my opinion is, the Chancellor should be bound to act by the majority of opinions.

Would it be expedient that he should have a double vote, and be Chairman?—Very likely; and he would besides have that influence which his rank and station ought to procure for him.

Considering that the Court might consist of a considerable number of persons, and, if chosen from different quarters, there might be conflictiug interests, would not the right of the Chancellor, to decide upon the deliberations of that Court, perhaps tend in many instances to secure a better result than if he were compelled to act merely according to the opinions of the majority?—I cannot say that I am prepared to acquiesce in that. I am quite aware of the great delicacy of placing such power in a single individual. I think a feeling of confidence on the part of the public, particularly of the members of the University, is very much to be aimed at in making so important a change. I am not aware that the control of the Chancellor over the majority of the opinions in his Court would have that happy effect. In stating all this, of course I shall be understood not at all to touch the question of legal right, which belongs to a different subject of investigation.

University of Edinburgh.

T. Thomson, Esq., Advocate.

20 November 1826.

Should you think it advisable, according to the view you have of the powers and functions of this Court, that persons high in station in the different learned Professions or Faculties, ought to be members of this Court?—I should think it in the highest degree desirable, that the persons who are to be called upon to perform these functions should be of that description. At the same time, if you are to leave it in any degree to election, or to official appointment, all that is a matter of some hazard and uncertainty. It might perhaps be expedient, in so far as these Assessors are to be elective, that they should be persons who have a certain Academical stamp upon themselves.

Exclusive of those who are to be elective, would you think it an improper arrangement, that one of the Judges, or perhaps the Dean of the Faculty, a member of the Presbytery of Edinburgh, and the President of the College of Physicians, should be members of this Court?—What is now suggested is conformable to what I have considered upon the subject. I think it highly expedient that there should be a class of official persons introduced into this Court, holding offices as magistrates in this city, such as the Lord Provost and the higher class of magistrates, and persons belonging to the College of Justice, or at the head of some other learned bodies, whose feelings and interests are of a kind to qualify them for the discharge of such a duty.

Do you think any member of the Senatus Academicus itself should be a member of this Court?—For the same reason that I have suggested the propriety of introducing a certain number of the Patrons of the University into the Court, I think there would be a propriety in introducing one or two of the heads of the higher classes of the University—the Principal, for example; but really these are details upon which it would be presumptuous for me to say I had formed any thing like a deliberate and complete opinion.

With respect to the office of Rector, do you concur in the opinions stated by Mr. Jeffrey as to that, or have you any difference from, or any qualifications of those opinions to mention?—I concur with Mr. Jeffrey in thinking that the office of Rector is one of more common detail, and that he is a judicial and executive officer. In the University of Glasgow, where I was educated, he had the double functions of being the extraordinary judge in cases of offence committed by the members of the University, where Academical punishments were competent to be inflicted; and he had, on the other hand, to control the financial concerns of the University.

Has it not, however, in practice, been generally considered as a compliment paid to a gentleman of celebrity, rather than the election of an officer substantially useful in superintending the details of College business?—During my residence at Glasgow for ten years, I do not recollect that the Rector was ever called upon to discharge any judicial function. I know that Rectors, within the memory of persons alive, have been called upon to discharge such duties, in consequence of outrageous acts on the part of certain members of the University, where expulsion was one of the consequences, or perhaps even personal coercion. During my own time there never has occurred any instance of the Rector being called upon to exercise that function; at the same time it was perfectly understood that it was competent for him to hold courts with powers of considerable magnitude. I believe, on the records of that University, there will appear to have been cases of capital trial by the Rector before the constitution of the present Court of Justiciary.

As from your statement, and indeed from all the statements which have been made to the Commissioners, it is supposed that it would be thought advisable this Rector should be an efficient officer, might it not be necessary to provide that he should be resident at the seat of the University, or within its immediate neighbourhood?—The occasions of interference are so very rare, that I believe the inconvenience of the non-residence of the Rector has never been felt in Glasgow. Talking theoretically upon such a subject, one cannot shut one's eyes to the inconvenience of having an officer of that description, who is not within reach, or whose attendance could not be demanded on a tolerably moderate notice.

Do you concur in the opinions stated by Mr. Jeffrey, with respect to the election of that officer?—I concur with Mr. Jeffrey in thinking that the election of that officer by the members of the University is highly expedient. What would be expedient in a University like that of Edinburgh, where no Rector has ever been appointed in that way, or, if there has been such an officer at all, he has been appointed by the Patrons solely, I do not pretend to say. At Glasgow, by the constitution of the University, and by usage, the election of Rector is vested in every individual who is entered on the books of matriculation for the year in which the election takes place, or who has been previously matriculated, and has attended a certain description of classes. How far it would be expedient to modify such a system, I do not pretend to say, considering how very likely it would be to excite violent feelings and irritations on the part of the students. Theoretically speaking, I certainly do think that there seems to be an absurdity in giving that power to boys who have entered the University the day before the election, which is the case at Glasgow. The election takes place early in the session, and if a young man is matriculated into the lowest Humanity class of the University, he has a vote as efficient as that of a graduate or a Professor. That, theoretically speaking, seems very absurd; and if one were going to introduce an analogous system into this University, I should think that ought to be modified, and it ought to be given to those who have attended a certain number of years, or who have commenced a system of Graduation, or had taken the first step towards a degree with approbation. In the case of Glasgow, during my long residence there, I never observed any thing which I could call mischievous in the popular system established there. In general I think the feelings of the younger students on that subject are of a kind that are not discreditable to them. At the time I entered that University, I believe it had been very rare for the students not to concur with the suggestions of the Professors, as to the election of the Rector; but in that year there was another person

University of Edinburgh.

T. Thomson, Esq., Advocate.

20 November 1826.

suggested by the students, and whom they were very anxious to elect—I mean Mr. Burke. Upon that occasion the Professors—particularly some of the more popular Professors of the University—were anxious that his election should not take place that year, and they had influence with the students, by temper and good management, to prevent it that year; but they concurred with the feelings of the students so far as to elect Mr. Burke next year. He was, I think, the first person at whose election I happened to be present. Since that time, I believe there has been a greater want of unanimity between the Professors and the students upon that particular point, than I had occasion to observe during my residence there; but I have not been an inattentive observer of the proceedings in that University to which I have always felt much attached; and I must say I think that, if any inconvenience has arisen, the Professors themselves have a great deal more to answer for than the boys, who are considered to have an unquestionable title to an equal vote with the advanced graduates and the Professors. I think any inconvenience or insubordination upon that subject has arisen from an injudicious attempt to control the right of the boys in their choice, which was enough to provoke a certain degree of resistance that might have been avoided, if more good humour had been shown on the part of the masters. At the same time, talking of the matter theoretically, I do not think the system which is pursued at Glasgow ought to be literally adopted in other Universities, where a beginning is to be given to a similiar constitution.

On principle, do you think any system a good one, which, in order to work well, seems in your opinion to require that sort of management and communication between the Professors, who ought to have authority, and the Students, who ought to obey?—I think, in that matter, the Professors are not called upon, nor are they entitled to command; and they have erred in attempting to do so.

But without commanding, do you think it inexpedient that they should attempt to manage the Students in any way, with regard to their votes upon the election of a Rector?—I think the less of that management there is, the better. If the Rector is to be an elective officer at all, the less management attempted on the part of the masters, the more it will redound to their own consequence and credit, and give more influence to their opinions.

Do you think there would be any practical utility in instituting the office of Lord Rector in any University where there was a Chancellor and a Court of Assessors, such as you now propose?—The only cases in which I think its utility might become apparent, are in those of discipline, where members of the University, Students for example, have committed academical offences, which, as at present, have been considered the subject of inquiry and determination by the Senatus Academicus itself. The only point for me to consider would be, if a Rector ought not to be introduced as a member of that Court, to give weight and importance, and a feeling of control, to the proceedings of the Academical Senatus.

You have mentioned that there have been instances in which the Rector has exercised considerable jurisdiction in Glasgow; do you remember any instance which you can mention to the Commissioners?—I believe several instances have occurred, of which I cannot give the details, where expulsion became the punishment, and which arose, I believe, from certain acts of indiscretion on the part of the students, and the expression of certain opinions that were not considered very orthodox or very correct. One person, who afterwards made himself a distinguished man, was expelled from that University by a Rectorial Court, in consequence of having said something in a sort of debating society, which came to the ears of his masters, and which they, with no very signal prudence, chose to make the subject of public discussion and inquiry. He was a stubborn proud person, and would not yield to the admonitions of his masters, which were not very mildly or very temperately given; and it resulted in his expulsion.

Should you see any objection, were this office created in the University for the first time, to consolidate it with that of the Principal?—I think it would add to the efficiency of academical punishments, if a person not strictly academical were the President of the Court; and in that point of view the Rectorial Court of Glasgow, which is composed of the Senatus Academicus, with the Lord Rector at the head of it, is perhaps a better model than any other. In practice, where the Rector is not present, he always appoints a Vice-rector, who is one of that body; and therefore, in the ordinary routine of business, the Principal or one of the Professors is President of that Court.

You have mentioned that at Glasgow, besides his interference in College discipline, the Rector may control the University accounts; does he actually do so, or is that control merely nominal?—I am not sufficiently informed to be able to say that it is very efficient. I think a Rector does not discharge his duty, if he does not look at the accounts, to a certain extent. I have reason to think that some of the Rectors appointed in my time were very conscientious in looking into the state of the University accounts. I do not think, that, according to our understanding, the control went further than observing the accuracy of them; it did not extend to a control over the expenditure of money; but, of course, he would not have acknowledged an account to be good, where money was spent in a way not acknowledged to be regular according to the rules of the University. In general I think his power is understood to be that of seeing that the expenditure is of a proper sort, and the accounts fairly made out.

Do you conceive or not that the Principal has full power to punish all offences against the discipline of the College?—In the University where I was educated, I am not aware that, singly, the Principal had any power whatever; but the Academical Court was certainly understood to be so constituted, that the Principal and the Senatus Academicus had a power of judging in all ordinary cases, and that power was exercised daily—not a week occurred in which there was not some exercise of it for small offences. I presume it was only in cases of a more atrocious kind, that the Rectorial power was called in. Indeed, I do not think it would be possible to administer the affairs of College discipline at all, unless you vested that power in some court within the College.

University of Edinburgh.

T. Thomson, Esq., Advocate.

20 November 1826.

Have you any suggestion to make with reference to the general discipline of the University, or as to the classes, or any other matters connected with it?—Indeed, my opinion is, that very little regulation upon that subject is required. When the Professor has been competent to his duty, by his character and talents, I have observed the students were never behind hand in attending to his instructions. Of that I had the satisfaction of seeing signal examples in the University where I was educated, and where there was nothing of a regular system of control further than that which the particular Professor chose to exercise by means of admonitions, trifling fines, and other little expedients of that sort; certainly without calling in any extraneous power to aid him in the discharge of his duty. I am aware that there must have been cases in that University where a little assistance from without would not have been amiss, where, in consequence of the habits and character of the individual, he had entirely lost his power of control; but I am not aware that this was ever actually done.

Would you suggest any regulations for the purpose of ascertaining or enforcing the regular and constant attendance of the students?—With us at Glasgow there was no other control but that of the imposition of a fine for every act of absence. Catalogues were regularly called over in the class every day. When the class is extremely numerous, some other expedient may be adopted, to avoid the waste of time. It may be done by a censor. The fines were increased, if the magnitude of the negligence became very gross; and at last, if the offence became incorrigible, or apparently so, it was a fit subject of complaint to the University Court, and it might result in actual expulsion; but such cases were so rare as really not to have come more than once or twice under my own observation.

Would you not consider proof of regular attendance, in some way or other, necessary, with a view to graduation at the Universities?—Certainly; and in addition to the natural attractiveness of the Professor's Course, which I believe is the main spring of all regularity of attendance, graduation might be fitly employed as an engine for enforcing more regular attendance. Without saying to what extent attendance ought to be required in each particular course, a certain quantum of attendance should be made necessary, to entitle a person to proceed in his graduation.

In the event of a system of graduation being adopted, would you think it advisable that a form of certificate of proper attendance should be devised, which it should be incumbent upon a student who aspired to graduation, to show, to entitle him to it?—I think it absolutely indispensable, and I believe all the Professors are in the habit of giving certificates, modified according to the quantum of attendance.

With regard to a greater extent of Examination in the classes, do you concur with what Mr. Jeffrey said, or have you any additional observations to suggest?—I am not clear that my opinions go quite the length of Mr. Jeffrey's upon that subject. I think that in the lower classes, of course, Examination is absolutely essential—I mean in the Greek and Latin classes, where the languages are to be acquired. I also think that, with the view of acquiring certain practical habits, a good deal more than mere lecturing is desirable, and indeed necessary; a certain mixture of examination, with a still larger quantity of individual exercises by the boys, would be highly expedient, and I have certainly seen it practised with very great effect. I am not of opinion that the best mode of examination is that of setting apart a particular hour, of which the students are all aware when it is to take place. I think, in the first place, the art of examination is one of the most rare I have had occasion to observe to be possessed by public teachers, and a regular and solemn examination generally results in something extremely jejune and unedifying. I think an examination which is to go over the whole subject of lectures, in the more advanced classes, is inexpedient and useless. It has occurred to me, when the Professor feels himself qualified, and when he comes to a certain part of the subject where there is complexity in the detail, or perhaps a little obscurity, that to stop suddenly, and ask certain questions which will elicit answers, indicating how far he has been understood and followed by his students, would be exceedingly expedient, both as a check upon the inattention of the students, and also for enabling him to do—what I think is the great use of examination—to give additional illustrations of his own meaning. I cannot now speak from my own knowledge, but this I know, from what I reckon very good information; that one of the most instructive parts of Mr. Smith's academical labours was by examinations of that kind. It was done at a separate hour, I admit, but it was chiefly done by asking questions here and there upon the subject—not going through a catechism of the lectures, but starting off at a particular point, and asking a particular question; and, upon finding it well or ill answered, then launching out himself into additional illustrations and expansions; and I have heard from those who had the benefit of attending his lectures, that these examinations, so far from being shunned, were regularly attended, and were rendered exceedingly attractive. I do not imagine that in the higher classes of Philosophy—and there I differ materially from Mr. Jeffrey—these examinations will be attended with very great advantage. I think certain exercises ought to be prescribed, to give a habit of composition, and to test the advancement of different boys. But I think, among that class of students, the great desideratum is, the excellence of the lectures; and where these are really of a kind to deserve or to attract the attention of diligent students, very little compulsion will be necessary to enforce attendance or attention.

Although you do not recommend a system of very minute examination upon the lectures, would it, in your opinion, be advisable to institute examinations upon works recommended to be read by the Professor, in order to ascertain if private study was carried on, and proficiency made?—I have had no experience of that sort of examination certainly, but it occurred to me, that the fittest sort of examinations were those upon particular details in the lectures, which could be reduced conveniently into a system of questions and answers, in order to ascertain whether the Professor had been understood, and at the same time to fix his meaning in the minds of his hearers, and to afford opportunity of further illustration. I believe the other

University of Edinburgh.

T. Thomson, Esq., Advocate.

20 November 1826.

system, according to my recollection (I mean that of reading or ascertaining what books had been read), was generally accomplished by means of written exercises, and short abridgments of books that were suggested.

Supposing a good text-book were chosen, upon any subject, say that of Political Economy, and that the method of conveying instruction were wholly by examinations and illustrations, given at the same time upon such points as might appear to require additional explanation, and without any lectures at all, does that plan appear to you to afford sufficient means of conveying information?—There cannot be a doubt that it must be the means of conveying a great deal of information. I doubt if it would be attractive to students, unless it were made a compulsory part of their attendance. I think that without lectures, and those too of a pretty high class in point of originality and talent, there would be little chance of obtaining the attendance of voluntary students.

With regard to the subject of graduation in this University, have you any suggestions to offer, as to the manner in which you think the degree in Arts might be rendered of more value, and be made subservient to the promotion of literature and science?—The system of having compulsory degrees has been long established in all Universities, with the exception of a very few instances. In Glasgow, the system of compelling persons to take degrees in Arts, has almost entirely ceased, except as to certain persons who hold bursaries, or situations where a control can be established. In place of degrees, or the old annual Laureations of the students, the system of Premiums has been resorted to as a sort of succedaneum, to stimulate industry and to reward merit; and the effect of that has been very great. I have no doubt that, without abating the practice of giving premiums, a great additional stimulus might ultimately be created, by establishing a system of honourable degrees in the University; not that I think those degrees ought, more than at present, to be essential to the entry of students into any professional situations afterwards. It ought not to be matter of necessity, that a person entering into a profession as a lawyer, or even perhaps as a physician, should have taken that degree; but if it could be so managed, it should be stamped with a certain degree of éclat and credit. It would be courted and valued, and a man would enter into life with great advantage, who carried off this honourable distinction. I think the system (which was that under which I myself took a degree) of carrying on all the examination at once in a single day, is extremely bad. At the University of Glasgow, though it cost the candidate a great deal of previous reading and study, the whole business of examination was performed in one day, in the course, perhaps, of five or six hours. Though even this must appear very formidable to a young man, I do not think it, in its own nature, very efficient for the purpose. I think what is chiefly to be aimed at, with regard to a person who is desirous of ultimately taking the degree in Arts, would be, that there should be an annual examination as he advances; and the ultimate examination should relate, either to the subjects which had been last treated of, or to some general review of what he had previously done. In this way, there should be a preparatory step to the degree annually made by the person who was aiming at the acquisition of these Academical honours.

When you state that six hours were occupied in examination at the University of Glasgow, you do not mean that such a time was employed in the examination of yourself alone?—Yes, in the examination of myself alone.

Is there anything in the circumstances of the Scottish Universities, or in the circumstances of any of the students attending them, which tends to throw any insurmountable difficulty in the way of establishing a system of Honorary Graduation, such as that to which you have adverted?—I see nothing in the way of establishing that system, to the extent to which I think it is desirable to adopt it;—I mean merely as an incitement to diligence and activity in the students, and as a very fit mark to be placed upon those who are meritorious and entitled to it, when they quit the University; by which, without giving them a title to enter into any other profession, it would give them the advantage of approaching such situations, and entering the world with more notoriety, and with an authentic stamp of proficiency; with more than the acquisition of a premium, or of a certificate from the individual Professor, which is all they have to boast of at present.

Although the institutions of Scotland do not admit, perhaps, of the same encouragement being given to graduation as those of England, do you not think that there are various means by which young men might be encouraged to graduate, such as conferring Academical privileges upon them, for example?—I think that is one of the instruments which may be fitly employed in inducing them to aim at Academical degrees. I imagine at the first it would do a great deal, if well gone about, and if there were sufficient importance and solemnity accompanying the ultimate assignation of those honours. I have no doubt it would also very much conduce to the importance and value of them in the eyes of young men, if certain privileges were connected with them; and, perhaps, if they had the right of electing the public officers to whom I formerly alluded, it might be highly expedient. Something might be gained in giving them the use of the public Library. I consider the Library is itself a very important engine, if well managed, both for the advantage of the students, and in giving a value to the privileges of degrees, if connected with it. I think if the persons who have fairly entered upon the Curriculum of Arts, were to be entitled to some advantages in the use of the Library, and if these were continued, after quitting the University, to those who had obtained these honourable degrees, and who at the same time were resident here, a very valuable additional motive might be afforded for attempting to achieve those honours.

Although you might object to making the taking of a degree an indispensable preliminary to a person becoming a member of the Faculty of Advocates, yet, if a certificate of a good and sound previous education were required by that body, might not that be a considerable encouragement, indirectly, to graduation?—I am of opinion the former system of the Faculty of

447

University of Edinburgh.

T. Thomson, Esq., Advocate.

20 November 1826.

Advocates was in that respect nearly perfect. According to my understanding, when I came to the Bar, it was essential to produce evidence of attendance upon the Philosophy classes. I produced the Principal's general certificate of that attendance, and of having taken the degree of Master of Arts, and separate certificates of attendance upon the Civil and Scotch Law; and I was not permitted to stand trial as an Advocate, until these had been lodged with the Clericus Intrantium of the Faculty. In consequence of an attempt to render the rule still more rigid, or to introduce some new modifications, things have, for the last three or four years, remained without regulation at all. There has been no necessity for producing evidence of any sort of attendance upon Law or Arts, for the last few years. I do not know that the slightest practical inconvenience has resulted from that system of misrule; but one cannot state that persons should be entitled to approach that profession, without some evidence of education and of competent knowledge; more especially as the examinations which precede admission into the Faculty are, I conceive, too slight to afford anything like a test of actual advancement.

Is it in your opinion desirable that some settlement should be come to upon that subject?—Yes; and I have always understood, that in general the body was disposed to adopt a system of regulation; and the only question seemed to be, whether it should be more or less severe. The cause of the present state of disorder seems to have been the desire of imposing more rigid restraints than formerly existed. I think evidence of attendance to a certain extent at the University, not only upon the classes of Law, but of the Arts, ought to be required.

What is your opinion as to the present Curriculum—first, generally as a system of academical instruction, and then with reference to the existing state of the Universities in Scotland?—I think the classes that are at present actually required, in those Universities where graduation is practised in Arts, are just those which I should be disposed to continue as the preliminaries to that honour. Some question may arise as to the order in which these ought to be taken, and a good deal of speculation may be started as to the subjects of these different classes, and as to the arrangement or order in which they are to be taken by the students. It is pretty well known that the present system is a sort of fragmented state of what was originally the Academical Constitution of the whole of the Scotch Universities. Whether it has now got into a better shape is certainly to be questioned. The great division of the courses is into Physical, and what we may here call Metaphysical Science, in the most extended sense. Of course, every one is aware that, in the old system, they began with the Aristotelian Dialectics, and advanced to Pneumatics, or the Science of Mind, and then to Ontology, or the general qualities of matter and mind. Originally, the subject both of the human mind and the Divine mind followed Physics upon the old system, and was therefore called Metaphysics. Now, I do think that there is a great deal may be said in favour of a modification of the present arrangement, by which Physical Science ought to take precedence of the Science of the Mind. There is, however, one very great objection to the change: the subject of Physics indispensably requires a knowledge of Mathematics. If you commence the study of Physics at the early age at which boys leave the Language classes, I am afraid you will seldom find them prepared with a sufficient knowledge of what is absolutely indispensable to the study of Physics. Upon that score alone, I think the present arrangement has its recommendations; for, during the course of attendance upon what is called the Logic and Ethical classes, the students are commonly employed in bringing up their knowledge of Mathematics to qualify them for attendance upon the class of Physics; and without which, no attendance on that class can be of the least value. But for that objection, I certainly think it desirable that the science of mind should be postponed, as being in itself certainly of more difficult comprehension, and requiring a more advanced state of intelligence than the other.

Supposing it to become a more general practice to get the elements of Mathematics in schools, as it is partly done already, and that boys were to bring up their Mathematics, as you say, during the years of their attendance upon the Latin and Greek classes, would you think it expedient to change the present order of study?—I should, if I could see boys arrive at the termination of their Language classes with a competent knowledge of Mathematics, which might be further improved concurrently with their attendance upon Physics. I think an advantage would be gained in this way; but without that I hold the thing to be hopeless.

Are you of opinion that the Natural Philosophy class cannot be studied or attended with much benefit, by those who have but little knowledge of Mathematics?—In my opinion, it would be attended with no benefit at all. I hold the part of that course, which is really and truly academical and valuable, to be what is essentially connected with the Mathematical sciences; and that, even as things now are, though a proportion of the young men, after three or four years' attendance at College, go to that class, the number of them who are really qualified to take the full advantage of that course, is, I am afraid, extremely small.

Do you consider any mode of teaching that class, by which it is to be rendered more popular, and adapted to the greater proportion of those who, in your opinion, are not qualified, to be a departure from the proper character of the class, viewed as a part of academical instruction?—Decidedly, I think no man can teach that class well without intermingling in it a great deal of popular matter, that may be perfectly intelligible to persons of ordinary understanding, without the aid of Mathematics; but the Mathematical departments of it are by far the most important, and the most fit for academical institution; and, with respect to the more popular parts of it, I believe they are to be got out of the University with as much effect and *éclat* as within. Certainly, without an arrangement to secure a preparatory knowledge of Mathematical science, I think the commencement of any course of Physics must be inefficient. I have sometimes thought the matter ought to be left to the choice of individuals, and it should not be compulsory to take the classes in that particular order; but that those who felt themselves

University of Edinburgh.

T. Thomson, Esq., Advocate.

20 November 1826.

qualified to commence a course of Physics, without having gone through a previous course of Logic and Ethics, might be permitted to do so; yet, at the same time, arrangements should be so made as, if possible, to secure a sufficient quantity of Mathematical knowledge, to enable the ordinary class of boys to begin with their Physical courses.

According to the proposal you formerly mentioned, of having additional Examinations for those who are in the progress of graduating, would you take measures to ascertain their attainments in Mathematics, before they were allowed to enter the class of Natural Philosophy?—Mathematics should always be an essential part of the examination for Arts, and perhaps should be the most important and most formidable of any. Certainly there ought to be progressive examinations in Mathematical Science, as well as in other branches of Philosophy. How that is to be arranged I do not pretend to say; I see no reason why those, who choose to begin with Physical Science, should not undergo an examination in Physical Science, immediately after their attendance, and, *vice versâ*, those who begin with other branches of Philosophy, should pass an examination upon their other studies.

Before the students attend the class of Natural Philosophy, or any other class that properly belongs to the Science of Physics, would you propose that a previous examination as to their attainments in Mathematics should be required, with a view to the taking of a degree?—Of this one may be quite certain, that examinations in Physics must be a failure, if the students have not acquired that previous knowledge. It might be a facility and an advantage to boys, to make a previous Mathematical examination essential to those entering these classes, with a view to taking degrees.

As the present Curriculum does not require Mathematics, would you make attendance upon the Mathematical class in the University essential; or an examination, in it, wherever got, sufficient?—An examination in Mathematics, wherever got, would be more essential; for I think, with great submission, that Mathematics can be better taught in small extra-academical classes than in any other way.

By whom would you propose that that examination should be conducted?—Unquestionably by a Committee of the Professors in the University, who should be employed, or set aside from time to time, by order of the Senatus Academicus, to perform that duty.

Should it not be conducted by the Professor of Mathematics?—By him among others, and more especially with a view to those students who have not passed through his class, I think a little of his vigilance would be very well employed in taking that examination. The only other part of the subject to which the original question related, was as to the order of teaching other parts of Philosophy, as to which a good deal of observation may be made. Upon that point I have had different feelings at different times. At one time I rather thought the old system of carrying on the same students through a succession of classes had advantages, and that there was some degree of expediency in the same teacher carrying them through the two ordinary courses of what are called Logic and Ethics. There are advantages in the same Professor carrying on the same students through both; for there is a want of precision in the departments of those two classes at present, and a certain degree of jarring, and confusion, and collision, which might be avoided. Another advantage is, that the Professor becomes acquainted with the character and abilities of his hearers, and can adapt his instructions more exactly to their respective degrees of advancement. I may be partly influenced in having that notion, from having had it expressed to me by a Professor, with whom I had the advantage of living in great intimacy;—I mean Dr. Reid, who was originally Professor of Philosophy at Aberdeen, and who retained strong prepossessions in favour of that system. Upon the whole, however, I think the present system will be found more advantageous, and the occasional interference or collision, if it can be called such, between the two courses, is not an evil of very serious magnitude. Whether Logic ought to be the first thing to be taught, has been a favourite question among teachers in Universities, and upon that subject, certainly, it is impossible to deny that there is a great deal to be said in favour of the system of postponing what is called Logic, to a late part of the course. The general doctrines of mind, and some other parts of the subject, generally taught in those two classes, ought to precede what has been called Logic. But the Logic formerly taught in Universities is a thing which I hope, by this time, is almost discarded, as the only useful information on that subject forms a chapter in the history of error, or in that of the progress of Science generally. Perhaps there is nothing in the present system of teaching Philosophy in the more enlightened parts of Europe, that can be called Logic, separated from the other branches. It naturally blends itself with almost every part of the subject, and as to the great leading doctrines upon the subject of philosophical inquiry and evidence, and the limitations of the human mind, and its means of making advances on the unknown parts of Science,—these things are better taught in the more advanced stages of the course than at the beginning. In that respect, I think that, without affecting any nicety, the eelings of the Professors should guide them very well in the adoption of what is most useful. In the class which I had the advantage of attending, there was rather more time bestowed upon the Aristotelian Logic than I should have thought of the least advantage to students. In that respect I think a certain part of that course might have been more advantageously employed upon other branches of the subject.

Was that part of the course in later years abridged?—I have no doubt it was the tendency of the person I allude to, to discourage it, as far as he could do so. His predecessor, I believe, had employed the greater part of a six months' course in explaining the system of Aristotelian Logic, and even then it was reckoned a sort of disgrace not to be acquainted with the technical parts of Dialectics.

You have mentioned the opinion of Dr. Reid; did not that eminent man approve of the practice of having the education of youth in all branches of liberal study, with the exception of Grecian and Roman Literature, carried on under the direction of a single Regent?—That

had been the mode at Aberdeen, which he himself had practised, and he certainly was a person eminently qualified to discharge the duty of Professor, in all the departments of that Curriculum. He rested a good deal upon that sort of personal acquaintance that was formed between the Professor and his students, which he thought enabled him to adapt his prelections to their different capacities more accurately than when they were passing from hand to hand under the system in this University, and at Glasgow. At the same time, I believe, looking to the different attainments that are required, in order to do these duties effectually, I am inclined to think, a subdivision of the Curriculum has been a great practical advantage.

Do you think it tends more to the advancement of Science?—Yes; and I dare say indirectly to the advancement of the students.

Supposing the Curriculum to stand as it does for the degree in Arts, is there any defect that occurs to you with regard to the lectures; or, having heard Mr. Jeffrey's opinion as to a Professorship of Political Economy, do you think that any additional lectures are required?—It does not occur to me that the addition of a class of that description, as a compulsory part of the system, would be at all proper or expedient. Upon the propriety of its being taught as a separate branch from Ethics, my opinion certainly is, that in the present state of both sciences, a separation is indispensable. It is perfectly well known how there came to be established between them a sort of apparent connexion. Originally, it was an essential part of the course of Ethics, to teach the duties of man as a member of a Political Society. Under that branch, the Professors formerly taught a number of the general doctrines connected with the political rights of man, and some of the doctrines of jurisprudence as well as of politics; and to that extent it cannot be denied, that if you call this Political Economy, it forms a constituent part of what has been held to be a system of Moral Philosophy. But, as I understand the matter, the present science of Political Economy is far remote from that of Moral Philosophy; and if it has any connexion with other existing classes, it is more connected with that of the Law of Nature and Nations than anything else. It is not a system of duties that is to be taught, but a great Political Science;—what you may almost call the science of legislation, where all matters relating to national resources, and power, and wealth, are to be considered, and really forming no part of what I consider as genuine Moral Philosophy at all. Mr. Jeffrey was asked a question, whether, if the subject were well taught by the Professor of Moral Philosophy, any other lecturer would be required? I should say, certainly not. If it is taught well by anybody in the University, there is no occasion for another Professor. But it does not appear to me that that is the question to be solved; the question is, if it should be made compulsory on the same person to teach both sciences. You have selected a person to teach Moral Philosophy, who is a good metaphysician, and a good lecturer upon the higher branches of that highest of all sciences; and it is a question whether the same person ought to be imperatively required to give lectures upon the particular science of Political Economy, which I think is far remote from the other, and requires a degree of constant attention and vigilance, as to the progress of things in the country, which would impose a task sufficient to exhaust the talents and industry of any one individual. I have been one of those who have undisguisedly expressed an opinion, that I hoped at some time or other a separate institution of that sort would take place in some of the Scotch Universities. How far some of the Universities would afford encouragement to it I cannot say; I believe at Glasgow it has been taught by the Professor of Moral Philosophy as a separate class. It was not so taught in my time; Dr. Reid never attempted the subject, I believe; but Mr. Smith did introduce into his course a much larger proportion of discussion upon topics bordering on Political Economy, than had been the practice of Mr. Hutcheson, or those who preceded him. Under the name of Natural Jurisprudence, and the Rights of Man in a Political State, he did contrive to introduce a great deal of discussion on that subject.

Would you propose to recommend the institution of that class in the College of Glasgow, as well as in Edinburgh?—That really depends upon what appears to be the demand for it. I think that in this metropolis, where the education of the higher classes of individuals—at least the greater proportion of them—is conducted, and where education for the profession of the Law and for the Bar is chiefly conducted, there is, and has been a manifest demand for it; and upon that score alone is the thing to be recommended. I do not think the Professor of Political Economy ought to be endowed with an income sufficient to remunerate him, independently of the success of his own labours. The only thing is, whether, instead of being left to the occasional industry of a Professor of Logic or of Morals, or any other Professor, such as that of the Law of Nature and Nations, it ought to have that distinction put upon it, which is put upon other sciences, so as to induce individuals to bestow their activity and diligence in preparation for it.

Do you consider that there is a less demand for a separate class of Political Economy at Glasgow than in this University?—In my time there was a great taste for the subject in Glasgow; it was taught by Mr. Miller, in his classes of Law, and to a certain extent with eminent success certainly; but in a way which fell short of what I should call a complete system. It was not attempted at all by the Professor of Ethics, but it made part of those voluntary courses of law which Mr. Miller was in the habit of giving annually. It made indeed a part of two different courses; he taught some portions of it in his class of Civil Law, and other parts of it in what he called the Class of Government, but in the two together, a great number of what may be held to be leading subjects and doctrines in the science of Political Economy was admirably taught.

Looking to the situation of Glasgow as a great commercial town, and considering the number of persons of very considerable attainments, who at the same time are engaged in mercantile pursuits there, would not the same observations apply to the College of Glasgow as apply to Edinburgh?—To Glasgow, as I knew it formerly, they would apply completely; there was a

University of Edinburgh.

T. Thomson, Esq., Advocate.

20 November 1826.

great ardour among persons in that city, which was originally inspired by Mr. Smith's Lectures, and continued by Mr. Miller, for acquiring a knowledge of that science. It was a subject of conversation and reading among the more enlightened persons engaged in commerce; and though now it has become more a manufacturing than a commercial city, it seems to me probable that a sufficient number of students might be found there to maintain and support a class of that sort.

In the practice of the Scotch Universities, has not the Chair of Moral Philosophy generally been held to include the Science of Political Economy?—In the way in which I have explained it, I think it has; but the Political Economy that may be considered as making a part of the Science of Morals, is chiefly the doctrine of political duties, and not that extensive science which has grown up in modern times, and which has greater affinity to the science of legislation than to that of morals.

You have stated that you consider the Library might be made a considerable engine for increasing the value of degrees, by communicating the benefit of it in after-life to graduates, and also in some other respects;—the Commissioners would be glad to hear your views as to that Library in particular, and also any suggestions you would wish to offer as to the regulation of an Academical Library generally?—The subject is one of great and serious importance, but it is one upon which I cannot pretend to suggest anything valuable. I think, if I am not mistaken, that the public Libraries of all Universities have been less effectively employed, either for the purposes of instruction or excitement, than they are capable of. I believe one great misfortune has been the want of funds; and another consideration has been the difficulty of giving admission to students of an inferior age and degree in the University. I think it would be extremely important to have the inferior students and the younger classes supplied with books from libraries of their own—I mean libraries appropriated to their different classes; and that the great Public Library should not be laid open to students, until after they had advanced to a certain point in their attendance, or in their graduation; but that that point should commence early—as early as is apparently compatible with the safety of such an establishment. When they do come to that point, I think the facilities ought to be rendered as liberal as possible, in giving the students the use of the books contained in the Library. According to its original constitution, the Library at Glasgow was open to every matriculated student, who paid an insignificant sum of, I believe, 2*s*. 6*d*. for his admission into it; but in my time this had ceased to be the case. It had been shut up, and was inaccessible to all, excepting the Professors—it was inaccessible as a matter of right; but the Professors were reasonably indulgent to advanced students, in permitting them to borrow books. I recollect very well that I had the benefit of that Library, while a student in the University, being one of more advanced standing than almost any one who had the profession of the law for his object. I think a great deal might be done in the way of regulation, in order to enhance the value of libraries practically, both as a means of instruction, and as a means of excitement. Whether the resources for maintaining those libraries ought to be drawn entirely from the contributions of the students is, I think, very questionable. I rather think that, except by a little support from without, you cannot possibly maintain these libraries at the point of completeness which ought to be aimed at. The privileges that are possessed by the Scotch Universities are certainly very valuable—I mean, by having a title to all British published books; but, even with the aid of that privilege, I doubt if the resources of the existing libraries here, or at Glasgow, are such as to keep them up at that point which is indispensable to their respectability and usefulness. If that object could be attained, either out of the public resources, or by the larger contributions of the students, I think they might be made a most useful engine, particularly as an excitement to the acquisition of Academical honours.

Supposing, however, the use of the Library were given as a matter of right, would you propose that the use of it should be restricted to such graduates as, after taking their degree, continued to pay annually a certain sum to the Library?—I think it would be expedient as well as reasonable, that they should continue to pay for the privilege of the Library, and that would be an additional resource. The amount of such payments ought to be very moderate.

Do you think the Professors ought to pay for the privilege of having access to the Library?—Perhaps there is no very strong reason why they should not; I should think all who take advantage of that Library ought to feel that there is a sort of propriety in subjecting themselves to a certain tax for that purpose.

From your observation while a student, and from the opportunity of observation which you have had subsequently, do you think that the benefits that might be derived from the Library, either as a means of general instruction, or to the students, have been restricted, by its being entirely under the control of the Senatus Academicus in different Universities?—I do not think, if I may venture to say it, that either here or at Glasgow, the Senatus Academicus have been quite alive to the advantage which the Library put into their own hands; and they have been more timid in communicating the privileges of the Library to the students than has been expedient or desirable. I think the difficulties which are thrown in the way of students going to the Library here, arise from the want of a sufficient establishment of Librarians and keepers to assist in the examination of books on their return, and to control the students in the fair, honest, and proper use of them. This has been one great obstacle in their way; and for that no other apology has been usually given, but their want of means to remunerate a sufficient number of keepers to meet the great demands of the students.

How many Librarians are there in the Library of the College of Edinburgh?—Not having been a member of this University, and never having made use of the Library, I cannot be acquainted with the details. I have reason to know from information that there is a tardiness in the administration of the Library, which is extremely discouraging and inconvenient.

University of Edinburgh.

T. Thomson, Esq., Advocate.

20 November 1826.

At Glasgow there are various Libraries besides the Public Library, and some of these are administered by the students themselves, or rather by those whom they select for keepers or managers; and I am convinced that one of the great objects of our ambition was to become one of those who had such administration or management as keepers or under-keepers of these Libraries. It has occurred to me that in the University of Edinburgh, as they cannot afford to pay a great number of assistants in the Library, without whom it is impossible to be carried on with the facility and dispatch that is necessary, it would be in the power of the Professors to select some of the most meritorious students, who, without any remuneration, would consider themselves not only honoured, but benefited, by being permitted for a year or two to act in that capacity.

Your view being that they would receive benefit from the advantage they would have of consulting books?—Yes; from the advantage of coming into contact with the public Library; even though they would be restricted in their own use in borrowing books within the same limits as other students, there would be an advantage, which a young man of literary ambition would be desirous of obtaining. I am perfectly convinced that there would be found among the most meritorious students an anxiety to be employed in that capacity.

Do you think that it is necessary to the safety of the Library that a deposit should be required when a person takes out a book?—The deposit of a small sum has been required in this University. It was not required at Glasgow of those who occasionally were admitted to the benefit of the Library, but I confess I see no very serious objection to it. The sum ought not to be very large; nor do I suppose it can operate as a very great check in regard to the fair use of the Library. Unquestionably, in the use of a Library like that, one must expect a little negligence and carelessness at times, which ought as much as possible to be checked. In this University, and in some of the other Libraries that I have seen, from the want of a sufficient establishment, the check has not been made to operate; and in that way, things being done in a hurried and rapid manner, books have been returned in a mutilated state, and no one knew who was the author of the mischief, and the deposits came to be of no avail. As to depositing anything equivalent to the value of the books delivered out, I do not think that ought to be considered as the principle and object of the measure, supposing the law is strong enough to enforce the restitution of the books, or a remuneration for any occasional loss or mischief that is committed from the indiscreet use of them. If you expect a deposit equal to the value of the books, the thing is utterly impracticable. I have known in this University a book which might have been sold for £300, lent out upon a deposit of half-a-guinea, or a guinea.

The Commissioners understand that, besides the Library here, there is an extensive one belonging to the Faculty of Advocates, which also possesses, under act of Parliament, the privilege of getting all British published books; have you had occasion to know that either or both of these Libraries have been of great use to literary persons, who were not connected with either body, in the prosecution of literary works?—Since I have had occasion to know anything of the Advocates' Library, it has become gradually more and more the aim of the Curators to make it available to literary men. It was originally a sort of private property of the Faculty of Advocates, but from the time they acquired the privilege of having books from Stationers' Hall, I think they ought to have felt that it ceased to be merely a private Library, and became one on which the public had considerable claims, so far as the fair and discreet use of the books was concerned. I have been many years a Curator of that Library; and in that situation I have given every reasonable facility to literary men in the use of the books of the Library, not merely in reading, but in borrowing them; and I may say, as far as I have had experience, I am not aware that there has been the slightest abuse or indiscreet exercise of that privilege.

Have many persons availed themselves of the opportunities afforded by that liberal permission of the use of books belonging to that extensive collection?—I should think a great many in the occasional use of books, and a considerable number in the more extended way of borrowing them. A good many persons, who deserve the character of literary men, have refrained from making a direct application to the managers of the Library, and have attained their object through the means of friends who were members of the Faculty, and who have permitted them to borrow books in their names; and at this moment there are a good many instances of that kind. This, however, I do not consider as an expedient so proper or advisable as a direct application to the Curators.

Have you had occasion to observe frequent acknowledgments made in literary publications for the benefit which has been derived from the use of volumes from the Advocates' Library?—They are extremely frequent. I do not think that any work of consequence has appeared upon any subject connected, properly speaking, with Scotland, historically, politically, or statistically, in which the author has not had occasion to acknowledge his obligations to the Library of the Faculty of Advocates. It has been the object of those who have administered that Library for many years past, to consult the wants of literary men, when made known to them. In many instances we have solicited the suggestions of men who were employed in literary pursuits, as to what books would be wanting and desirable, that the Library might be supplied with them for their use.

Then, has the result of the judicious and liberal administration of a Library of that character, been to afford to literary people, engaged in the prosecution of literary works, the means of extensively consulting books which were not within their own private reach, and not to be found in private libraries?—Certainly, that has been the result in these instances, and the same advantage might be communicated by the University Libraries if they were placed under due regulation, and with better resources.

Then, in that view, do you consider that those upon whom the necessity is imposed of

University of Edinburgh.

T. Thomson, Esq., Advocate.

20 November 1826.

furnishing copies of such works as are entered at Stationers' Hall to the Libraries, derive, in a great many instances, essential benefits from those Public Libraries, or may, if properly managed?—I have no doubt that the resources which are drawn from these contributions at Stationers' Hall, do flow back again in various ways in the creation of new works. That I think very probable. As to the justice or propriety of assessing the authors of books in that sort of way, I do not pretend to offer an opinion, because I believe that in some instances it has been felt as a considerable grievance. At the same time I have not the least doubt that the grievance falls far short of the amount commonly stated by dealers in such commodities; and, looking to the liberal use which has been made of these Libraries, it may be truly said that the authors and publishers of books derive considerable benefit from that.

Have you any observations to suggest upon the subject of the patronage of the Professorships in the Universities? —There can be no subject, generally, more difficult than that of finding a mode of appointing the best qualified persons for such situations, where opinions and feeilngs may vary so much. With respect to the University of Edinburgh, I confess I am rather inclined to think that the present Patrons are, upon the whole, a body not ill qualified or indisposed to decide agreeably to the general opinion and understanding of the public; and they are likely to do so, if they could be left uninfluenced by extraneous causes. I think that, though avowedly not a learned body, yet there are men of influence and education among them, who are very nearly connected with the means of information, as to who are likely to do credit to their own establishment; and if they were left alone, uninfluenced by political or other considerations, I am confident their appointments would not generally deviate very far from what would be thought good and right. Of course nothing of the sort can be expected always to work with perfect certainty. There may be accidental circumstances which will divert them from that best possible choice, which might be made, independent of personal or political considerations. Altogether, I do not know that the choice is not as safe in their hands as it could be in any other. I do not think it would be more safe in a body of Academical Patrons, of whom we have an example at Glasgow, and who, though certainly more competent to judge, are fully more liable to influence from connexion than perhaps the persons who have the patronage in Edinburgh. Judging at least from my own observation, I must say that, among persons who are candidates for offices, all of whom are reasonably qualified for discharging the duties, but amongst whom there is a diversity of actual merit in genius and talent, I think that, in a body of Academical Patrons, the circumstance of previous personal connexion is much more likely to divert them from the best possible choice, than in the other case of which I have been speaking.

Whatever theoretical objections there may be to the existing system, in your opinion, does experience show that the Town-council is not an unfit body to be entrusted with that patronage?—I think I am bound to say so; and in those cases where I think they have not made the best possible use of their power, it might be traced to the influence of external considerations and motives, more than to the want of judgment or of right feeling in them.

Although you think it would be fit the Town-council should continue to enjoy the patronage of filling up existing Chairs, do you also think that they should have an unlimited right to establish as many new Professorships as to them shall seem fit?—Where those new Professorships are not made compulsory upon the students, I can hardly think that the risk of exceeding the number unnecessarily is likely to be very great. If they establish Professorships that are not wanting, they become decided failures, and the only evil is the addition of useless members of the Senatus Academicus; which, no doubt, may be an evil. If it is made compulsory on them, if they establish new Professorships, to do it by considerable endowments out of their own means, a check is furnished in that way; for those endowments can never be sufficient to remunerate any literary person assuming the character and place of a Professor. At the same time, there may be other checks upon the gratuitous folly of the Patrons in establishing useless Chairs.

Do you think it would be a wise measure to declare that the Town-council should not be entitled to institute a new Professorship, without the consent and concurrence of the Crown? —If any check be at all necessary, I think a still better one might be obtained by means of that Visitatorial Court which has been proposed. Unquestionably, Royal Appointments have some great advantages attending them. It is presumed, in theory at least, that those who advise the Crown, are more beyond the reach of local prejudices and partialities than persons upon the spot, who may be in contact with the individuals who are likely to be benefited. At the same time there are, unquestionably, difficulties incident to either mode. We have seen both sorts of appointment extremely well administered in particular cases; in others, the appointments have been failures; and among the various modes of appointment, I am bound to confess that that which prevails in part, in this University, of appointing certain Professors from leets predetermined by another body, by the Faculty of Advocates, does not exclude the risk of very unsuccessful appointments. Therefore, it is impossible to say that any one mode of appointment will rid you of all possible inconveniences. And certainly, the sort of patronage that is most likely to be efficient, is where the patronizing body is composed of persons most under the influence of general or public opinion, which, upon the whole, is really about the best check that can exist, it being a sort of appointment in which the public is naturally called upon to take a warm interest, and probably to express pretty strong and firm opinions.

Does not the mode of nomination to which you last adverted, by a leet formed by another body, in practice and in fact vest the appointment wholly in the other body?—It does; I do not know how far it would be possible ultimately to counteract that mode of election; but in practice it certainly vests the election in the body that forms the leet.

Has that always been done?—Within the period of my own experience it has been so. The matter is so managed as to send up a leet, of which only one individual would probably accept the office.

Are there any suggestions you would wish to offer upon the subject of Junior Classes in this University?—There are a few observations which I may venture to suggest. In the first place, I think that the introduction of Greek literature into the Universities (which was some time soon after our Reformation) was done in a way to give Universities an impression that they had an exclusive right of teaching it—exclusive of other public seminaries in the country. Under that impression they appear to have acted until a recent period; and the elements of the Greek language have been taught exclusively in the Universities. I think one certain consequence of this has been, that in this country Greek literature has never been well or effectually taught at any period, even under the management of persons of the most undoubted talents and accomplishments; and it is entirely, in my opinion, in consequence of the habit which has been kept up, of employing one of the two years that are usually devoted to Greek literature, in teaching the elementary parts of that language. If it were to become more common (and in order to make it more common, it would be proper to put a check on the present system), if it became more common to acquire the elementary knowledge of Greek in other schools, and if the class of Greek were placed on the same footing as the Humanity class now is, I think the system would be vastly improved, and lead to a more perfect acquisition of the language. There can be no doubt, as it is now, that the two years supposed to be given to it are inadequate for the purpose.

Do you think, if it were found necessary, with reference to the circumstances of certain of the students who attend this University, that the elements of Greek should be still taught under the authority of the University, that it would be advantageous to devise some other means of teaching it, rather than having it taught in a regular professional class?—I have not the least objection to the elements being taught within the walls of the University in any way; but it is objectionable that any part of the Curriculum of Arts should be employed in the more elementary parts of the ancient languages. I not only do not think it a very fit mode, by which that can be well taught, in a great Academical class, but it consumes a quantity of time, and precludes the acquisition of the language in the only way that can serve to lay a good foundation for the permanent knowledge of it.

Do you think it would be a good thing, if it could be accomplished, that certain small classes under Tutors (the whole under the inspection and control of the Professor of Greek) should be established for the benefit of such students?—I do not think the control of the Professor at all requisite. I think if it were understood that the students must acquire a knowledge of the elements of Greek before they entered the University, in the same manner as they must acquire a knowledge of the Latin language before they came here, the means would be found naturally and spontaneously, without effort or control; and I believe it would be more effectually done in that form, than by any system of academical institution.

Is it possible, in the existing state of the Greek class at this University, that any man, excepting a student of extraordinary diligence—such a one as would make himself a scholar without attending the class at all—can become a good Greek scholar from mere attendance upon the class?—I think I can venture to state, with the most perfect confidence, that I hold it to be utterly impossible. I acquired the elements of Greek at a parochial school. I went to Glasgow, and entered into the elementary class, which I believe was exceedingly well taught by a most able and learned person; and I attended that class longer, perhaps, than any one else ever did; and yet I am certain that that period was quite inadequate to a thorough and permanent acquisition of the language.

Should you think it desirable, supposing the alteration you have adverted to, were to take place, and the elements were to be acquired elsewhere than at the Professor's class, that the carrying on of the study of Greek should be ensured during the whole course of the Curriculum, not by continued attendance on a class, but by an annual examination, to see that the proficiency already acquired was kept up?—I think something of that sort might be effectually and advantageously done, and that in certain parts of the examination for degrees, exercises upon some of the philosophical authors in that language might properly make a part of it. I believe, though I speak from imperfect information, that, according to the present system in the University of Oxford, it is common to require expositions of some of the more difficult Greek authors in philosophy, Aristotle and others, as a part of the exhibition of candidates for their degrees. My desire is not so much to secure a continuance of the knowledge of the language afterwards, as to give the student the means of acquiring it in the first instance. One year is employed in acquiring a knowledge of the grammar and a few books, which is all forgotten in the course of the first long vacation; and then, on returning to College, all he has to do, is to go over the more difficult authors, in a more or less hurried way, leaving him in possession of but very little knowledge.

Has any thing occurred to you upon the subject of bursaries, or the expediency of keeping up such a provision for young men of good talents, but of slender resources?—If bursaries could be so administered as to form a little additional incentive to the diligence of students of slender means, I think they might become extremely beneficial. As usually administered, they are too often the result of individual solicitation or of patronage, without much reference to the qualifications or attainments of the boys; with few exceptions, no doubt, arising from accidental circumstances. As to the principle of the thing, I believe that in Glasgow, formerly at least, there were certain bursaries which were only given after a comparative trial, and were assigned to those only who subjected themselves to such trial. There are certain observations of Mr. Jeffrey's, in which I entirely concur, as to the length of the Academical course. Looking back to my own experience, I should say that the system of a College course of five or six months, with a vacation of six or seven months, is, in the earlier stages of study, attended with very great mischief, and that, but for what may be called the financial difficulties of the case, I should have thought it extremely desirable that the system

University of Edinburgh.

T. Thomson, Esq., Advocate.

20 November 1826.

of one long term, and an enormously long vacation, should be considerably modified and altered. I am sure, as to the younger class of students, it is a system under which their minds may be said to go into complete abeyance. The only thing that has been attempted, in order to keep the students at work, has been the prescription of certain exercises to be written during the vacation; but, as far as my own observation goes, it is a most inadequate expedient for securing that object. I think that the general hindrance to Academical education is greatly increased by these disproportionate vacations; a much shorter period might suffice to complete certain branches of education than at present is taken, if it were not for these intervals of cessation from study. Therefore, whether a set of additional lectures or courses should not remain, as at present, a matter of voluntary arrangement among the Professors, or should become a more regular and permanent part of the establishment, I think is very well deserving of consideration. I am quite aware of the great difficulty there might be in making such an arrangement. The only thing like compensation I can see for it, would be to shorten the actual periods of attendance in certain departments.

Is Mr. Thomson of opinion that the class of the Law of Nature and of Nations is one that ought to remain upon its present footing, or would it not be one of considerable utility to the students at Law?—I think it might be made a class of the very highest attraction, and of great utility. It is one of those classes which it is impossible to ensure the success of, but by the good fortune of appointing a man of pre-eminent talent and learning. At one time, when it was an essential part of the Curriculum of almost all the Universities of Europe, compulsory attendance was enforced; but as it has ceased to be so, and has become merely one of the voluntary classes, I hink nothing but genius and talent on the part of the Professor can give it the least chance of success, or the least attraction. In such hands, I conceive that even now it is capable of being made a class of extreme value.

Looking to the immense extent of the course of the Professor of Scotch Law, even if made a course of two years, might not a great deal of important International Law, strictly separated from Municipal Law, be introduced into the class of the Law of Nature and of Nations?—In so far as that could be considered professional education, and as teaching the actual Practice of the Law, I do not know that I should consider that as the most advantageous mode of employing that Chair. I think there are larger discussions and higher topics very much connected with International Law, some of them essentially so, but not touching the actual administration of justice in this country, or making it a part of the education of a Scotch lawyer, that would fall to be discussed, and which would be the only proper topics of discussion in that class. In that respect, I think both the class of Civil History and of the Law of Nature and of Nations might be made extremely advantageous. I certainly should not say, at the present moment, that the class of the Law of Nature and of Nations was one of great desideratum. In the University where I was educated, the establishment of such a class did not exist. But there being a well-endowed Professorship, I think it might, under fortunate circumstances, be rendered extremely valuable.

The Rev. *Andrew Thomson*, D.D., called in and further examined.

Rev. Dr. A. Thomson.

Have you any observations to make with regard to the arrangement of the Classes of Divinity, in addition to what you stated upon your last examination?—I drew out a Table of what I thought would be an advisable course—[*Dr. Thomson gave in the Table relative to the Courses of Divinity, to which he referred.**] The principal alteration of the existing system that I would suggest is, the having a junior class of Theology, in which it is proposed that the Professor shall give the students an outline of the whole subject, prescribing to them Exercises, and subjecting them to Examinations as he goes along. Then, having got such an outline, they will be better prepared for following and understanding the Professor, at whatever stage of his course he may happen to be when they attend him the second session, than they could have been if they had not got that outline, and, without preparation, began to hear the Professor's lectures at an advanced period of his course. When a student comes to the Divinity Hall, perhaps the Professor is just concluding his course; so that the student is beginning at the end of the subject, and without any previous knowledge. If the plan now proposed were adopted, then at whatever part of his course the Professor might be when the students entered the class, they would be prepared for it, by having got an outline of the whole subject, which falls to be discussed more in detail afterwards. During the first session they attend Systematic Theology, Church History, and Hebrew. I believe I suggested before, that the Hebrew

should be attended as a preparatory class, before coming to the Divinity Hall, as it is absurd to set students to hear lectures upon Theology, when they are ignorant of the language in which the greater part of the Scriptures are written. The Professor of Church History, besides lecturing, prescribing exercises, and examining, reads Theological Latin with his pupils one hour, and Greek another hour, weekly; and, altogether, the junior class will attend four hours a-day. The students go on with the classes of Systematic Theology and Church History until they complete their Theological course; they begin to attend the Professor of Biblical Criticism the second session, and continue with him to the end. I would suggest that the Biblical Professor should read Greek and Hebrew with his pupils, giving to each an hour in the week, not merely as coming peculiarly within his province, but with a view to keep up their knowledge of the languages in which the Scriptures were originally written. During the three last sessions it is understood that the students shall attend five hours a-day, and the hours of attendance are made consecutive, both in the case of the Professors and in the case of the students, that their time may not be broken in upon, and that there may not be hours left open, which must in a great measure be lost to them. The Professor of Biblical Criticism would teach two hours a-day; the Professors of Systematic Theology and of Church History, three hours a-day. The Professor of Hebrew is to teach the junior classes one hour; his other two hours are supposed to be devoted to Hebrew, before the students enter the Theological class, and these two hours must depend upon the arrangements which are adopted in the Philosophy classes. I have mentioned the particular hours of teaching in the Divinity classes, but they may be changed. I have merely put the hours in the table, to show that an arrangement is practicable without the classes interfering.

In the scheme for the course of Theology which you have proposed, do you desire that the class of Biblical Criticism shall be taught for two years?—Supposing the course to be for four years, the students will attend the Biblical Criticism for the three last years. One advantage is, that the Hebrew Professor will have taught them the year before they come to the Theological course, and then, by teaching them the first year of their Theological course, there is no loss when he ceases; for the Professor of Biblical Criticism comes in his place, but applies himself to higher objects than that of teaching the mere language.

It will be one advantage attending the scheme you have proposed, (by which a preparatory course of Systematic Theology, embracing the whole subject, would be given,) to secure that the outline of a more extended course should be given the first year?—Yes.

Would not that be attended also with the advantage of securing that the subsequent course would be a more complete and regular one than in some instances it has been?—Certainly; I would have the teacher of the junior class to give a complete outline, so that during one year they will have got some general view of the subject; and when they come to his class next year, at whatever part of his systematic course he is, they will enter it with a previous general knowledge of the whole. At present they attend the first year of the lectures, when he may be in the very last part of his systematic course, which must necessarily be a great disadvantage.

Have you attended to the manner in which it was recommended, in the Act of Parliament of 1579, for the reformation of the University of St. Andrew's, those several branches should be taught?—Yes, there are so many particulars, that I could not trust my memory altogether, and therefore I have made some notes. I have to observe, in order to show the ideas they had at that period of the necessity of a complete course, that in the Divinity College at St. Andrew's there were five Professors. The course was four years. It was not four *sessions*, but four *years*. They attended the whole year, with the exception of September, which was the month for vacation; and the classes were so arranged that the Theological students were obliged to attend three Professors every day during the whole four years. And none were allowed to enter the Church until they had completed the Theological course, or were found worthy to take out their degrees, after what is called a "rigorous examination" by the Faculty.

Have you attended to the mode of instruction recommended in the first Book of Discipline?—Yes; I have read it more than once, and that certainly shows also the high ideas they had, in those days, of the importance and necessity of a complete course.

Do you think that, under those enactments, it was contemplated that such a thing as what is now called partial attendance should be tolerated?—Never. The system prescribed was as remote from anything of that kind as it could possibly be. The course of Divinity occupied five years, by the regulation of the first Book of Discipline. There is another thing of importance: none were to be admitted to the first College,—I speak of St. Andrew's,—or to be what are called *Supposts* or *Supposiți* of the University, unless they produced testimonials from the master of the school and the minister of the town where they were instructed, and had likewise taken trials by Examinators appointed by the Rectors and Principals of the College. The trials were to be as to their proficiency in the grammar school education, so that those might not be admitted to study at the University, who were not hopeful scholars. I may remark also, that the Hebrew was taught previously to their entering the Divinity classes. The Hebrew indeed was itself, in one sense, a Divinity class; but before they were admitted to what are strictly called the Divinity classes, they had to attend the Hebrew and to get a knowledge of that language.

Under that arrangement do you remember at what age it was expected that young men might be licensed to preach?—I do not distinctly recollect that; but I know that they were required to be much older than they are now.

Were they required to be of a more advanced age than twenty-one?—Yes.

Do you recollect whether there is any act of the General Assembly, enjoining that in the case of young men who could not afford to attend the University, some persons, being members

University of Edinburgh.

Rev. Dr. A. Thomson.

20 November 1826.

of the Presbytery, should be appointed to superintend their studies in Theology?—Yes, there is an act to that effect; but I do not recollect it very distinctly.

Do you disapprove entirely of partial attendance?—Yes; I think it is the grossest absurdity that can be imagined.

Do you happen to recollect what opinion was expressed concerning partial attendance, by Dr. Campbell, of Aberdeen?—He said the young men might just as well send their discourses by post, as come up to deliver them.

Have you any further explanation to give of the table to which you have referred the Commissioners?—No; I have read all the observations I had to offer upon that subject. If the Commissioners will allow me, I will state the reasons for requiring such an extensive course of study. They are as follow:—1. Because the subject is extensive, and such an acquaintance with it as is necessary to constitute a truly learned body of Clergymen, cannot be acquired except by education that is long continued, and that ensures constant and diligent application while it lasts. 2. Because the more learned and intelligent the Clergy are, of course the more beneficial will their influence be upon the community; and it is difficult to estimate the extent of this, considering the nature of their connexion with the various classes of the people,—the charge which is committed to them respecting teachers and schools, the estimation in which they are generally held on account of their office, and the localities which they statedly occupy as Ministers of particular parishes, in which it is their duty to reside and to labour: and 3. Because, if they do not become learned at College, it can seldom happen that they will become learned at any future period; for, while in England, a person can hold a living in the country, and yet prosecute his studies by residing at the University, or at some other place favourable to literary and scientific pursuits, a Clergyman in Scotland, whenever he gets a living, must reside permanently in the midst of his flock, and perform, in his own person, all the multiplied duties which that flock requires of him; and in this way he neither has time nor means for carrying on intellectual pursuits with vigour and advantage; so that, if he is not well stored with erudition before he gets a Church, it is not likely he should advance afterwards in the path of liberal, or even professional, knowledge.

With regard to the accomplishment of the object you have in view, of more regular attendance, and an extensive and well-digested course of Theology being pursued by the students, are you of opinion that, as the concurrence of the Church is necessary, the matter would be accelerated by any regulations issuing from this Commission, in so far as it is a matter of Academical regulation; or are you of opinion that it would rather weaken the disposition of the Church to adopt such proposals as those which you have now submitted?—I think it would strengthen that disposition. Certainly I think the Church would be a good deal influenced by the wish expressed on the part of the Commissioners.

Are you at all afraid of any jealousy being introduced by a Report, or by any regulations from the Commissioners, stating the paramount necessity for such a course of Theology as you have recommended, and the necessity of constant and regular attendance during the period for which that course is to be pursued?—No, I am not afraid of such jealousy. I have not the least doubt that individuals would still have objections; but I think that such a Report as is alluded to would be a means of getting the better of these, instead of confirming them.

Then would you rather suggest to the Commissioners, that, in the present state of opinion in the Church, something should originate with the Commission, in order to accelerate the attainment of what you consider a desirable change?—Undoubtedly. I have great confidence in the real merit of the case itself; and I am quite sure, if it were fairly presented to the Church, and presented time after time, that they would come to see the importance and necessity of it. I think the recommendation of such a body of men as the Commissioners would be listened to with much respect and deference. It could not be expected, all at once, that the Church should go into such an enlarged system; but they have already begun to go back to the old system. They have now required one year's attendance, at least, as in every case absolutely necessary; and by degrees I have no doubt they will be brought to see the propriety of having a complete course of attendance.

Do any suggestions occur to you, in regard to any particular mode of carrying it into effect, in which this Commission could be of use?—I am much afraid that anything like an authoritative interference would awaken jealousy; but I am quite sure that, coming as a strong recommendation, after such a thorough investigation of the subject as the Commissioners may be supposed to have made, it would have a great effect upon the Church.

You would not wish to see any regulations prescribing the attendance at the Divinity Hall?—No; I would rather wish that this should be avoided if possible. It would do harm.

Would it be an expedient measure to introduce an inferior degree, such as that of a Bachelor?—Yes, I would rather think it expedient to have a degree of that kind,—the getting of that degree presupposing a very strict examination. Anything that will secure a strict examination has a tendency to increase the diligence of the students, and to secure greater attainments.

Do you think that it would give students of Divinity the opportunity of distiuguishing themselves?—Yes.

Do you think it would be proper to exact a small fee from students of Divinity, for their attendance upon the Divinity class?—Yes, most proper.

Will you have the goodness to state your reasons?—I think Divinity students should pay fees, whether they attend regularly or not. I am not supposing that the plan of regular attendance can, all at once, be accomplished. The study is so important, as to make remuneration from those who benefit by it proper. Gratuitous teaching tends to depreciate that which is taught, in the estimation of the pupils and their friends. Such as are irregular students

457

University of Edinburgh.

Rev. Dr. A. Thomson.

20 November 1826.

are allowed to absent themselves, to teach in schools or private families, and by this means to earn what is necessary for the expense of their education. The regular students are more able to pay the Divinity fees than the Language or Philosophy fees. In the previous part of their course they were obliged to attend various classes, and to pay perhaps high fees, when they could do nothing to support themselves; but now they can get private teaching, and in this way do something for their own support,—therefore they are better able than before to pay for their education. It seems odd that they should just cease paying at the period when they can not only most easily afford it, but when they begin to get that part of their education which is strictly professional, and absolutely necessary for their plans of future life. The payment of fees would assist materially in furnishing a suitable emolument for the Divinity Professors, which they have not at present in Edinburgh, and in this manner enable them to devote themselves exclusively to their academical duties, the faithful and efficient performance of which requires so much time and labour during the session at College, and so much private study during the rest of the year. I would propose that the fees should be two guineas to each Professor, and that such fees should be paid for two years,—which, I think, would be fair and just. In that way the whole course of Divinity would cost the student sixteen guineas, or four guineas per annum. If the first year of Hebrew were taken away, and put into the previous course of study, this would subtract two guineas from the Divinity course, and add that sum to the previous course.

Do you not think that, by imposing such a burden, you would endanger the sufficient supply of useful clergymen?—No. The fees for their course of previous study at College amount, at the present rate, to £27. 6*s.*; and if the second class of Mathematics were included, as it ought to be, they would amount to £30. 9*s.*

Are the Commissioners to understand that you would recommend the payment of fees to be required by all students indiscriminately, whether they were regular or partial attendants?—Undoubtedly; I think the partial or irregular students should more particularly pay, for they are employed in lucrative occupations, which keep them away from College.

Would you not allow the Professors to dispense with payment, in case they thought it right to do so?—Yes; and they would do it always in the case of deserving young men, who were in poor circumstances. It is done now to a great extent in the previous classes here.

Are there any other suggestions with regard to the study of Divinity in this University, which you are inclined to make?—No, none occur to me at present.

Have you any suggestions to offer to the Commission as to the management or use of the Divinity Library in this University, founded on your experience when a student, or on your subsequent means of observation?—From the general view I have given of the mode of conducting the classes, I think there should be more copies of particular works than there are; for if the Professor gives the students a view of a particular subject, or an outline of it, and directs them to certain sources of information, there would be a rush upon the Library, with a view to works on that particular subject; and to have one copy of a work would appear a mockery to the students. I know that plan is adopted to a certain degree, but it is necessary to adopt it to a much larger extent.

Did it fall within your knowledge while a student, or has it subsequently, that there was any detriment which arose from the management of the Library being solely under the control of the Senatus?—I cannot say that I experienced any disadvantage from that.

Do you understand that there are any complaints among the students upon the subject of the Library?—O yes; there are great complaints by the Divinity students.

Will you state what you understand to be the hardship of which they complain?—They make a claim, (I do not know if it be a good one,) and say the Library is theirs, and insist that they should have the management of it, and that the Professor should merely have a *veto* in the choice of books. I do not know the grounds of this claim, but they speak very confidently about it. In Glasgow the Divinity Library is on that footing, and I understand it is very well managed there. The Professor attends their meetings; he has always a *veto* on every book that is proposed; and they manage the Library very regularly, as I understand from those attending the Divinity classes there. There are great complaints made here that they do not get the books.

Is that from the imperfect state of the collection, or from inadequate attendance?—They complain and say the books may be purchased, but that they are not brought into the Library. Lately they made a request that there should be an exhibition of the books which had been purchased; and they say they found, from the booksellers' accounts, that 700 or 800 volumes which had been bought, had never been introduced into the Library.

Did they state what had become of them?—Some years ago the Senatus Academicus interfered, and appointed some regulations, by which the Library was in some measure put under the Theological Faculty. But the Professor of Divinity still took the sole management, and he and others had many of the books in their possession, between the time of purchasing them and the time of depositing them in the Library. I believe the students have got in about half of the 700 or 800 that were awanting, but still the other half of them have never been seen. The students complain that there is not a regular exhibition of the accounts, so that they do not know if the books are paid for, and are not sure whether there may not afterwards turn out to be debts standing against the Library fund. When I was at College, the Professor did take the management; but every year there was an exhibition of the receipted accounts, which were put in a box or drawer in the Library; and every student could satisfy himself, by inspecting them, that all the money was expended properly, and all the books paid for. But the students say that this has been neglected.

Do you understand that the students rest their claim merely on the circumstance that they contribute towards it, and that it is so supported, or that there is any peculiarity in it different

University of Edinburgh.

Rev. Dr. A. Thomson.

20 November 1826.

from the general Library of the College?—There is this peculiarity:—I believe that the books were originally left to the students of Divinity for their use by Dr. Campbell. The students complain also that some of the books which are brought in there, really do not serve any good purpose, while others which would be useful are kept out. For instance, there is a copy of Hutchinson's Justice of the Peace. They say that booksellers just send in books which, from their not being very saleable, are ironically called *shopkeepers*, whether they are fit for Divinity students or not.

The students have not any control with regard to the purchase of books for the Divinity Hall Library?—No, I believe not.

It is understood that the Library has been left, in part, by a written will or instrument; do you know if the terms of the original bequest could be ascertained?—I do not know.

Are there any other complaints which you have understood to be made on the subject of the Library?—No, I am not aware of any others; but I have little doubt that there should be more copies of some books in that Library, and more attention should be paid in getting standard Divinity works. I am not sure that it would be right to exclude merely literary works; at the same time, considering the nature and purposes of the Library, these should be very sparingly introduced.

Have the Divinity students the privilege of the general Library of the College?—No, I rather think not, unless they matriculate. I believe they might be obliged to matriculate, but it is never done. I do not think it would be a bad thing that students should have something to say in the choice of books. I think it would be a good exercise for them if they could be put under proper control.

Is there not a book kept in which they can inscribe the title of any book they wish for?—I do not know: I have no doubt the Professor would receive a suggestion from any of them. If it were to be made a regulation that they should have something to say in the choice of books, reserving a negative power on the part of the Professor, it would exercise their minds upon a subject of importance.

Is there a separate Librarian for the Divinity Library?—Yes.

Is there any complaint made as to the mode in which the books are given out?—I have heard them complain that they could not get the books they wanted. But that I suppose is the consequence of so many applying for the same book at one time.

Are they required to leave a deposit for the books which they take from the Library?—There was not any in my time.

Have you heard any complaints upon that subject?—No, I have not.

At a Meeting of Commissioners at Edinburgh, on Monday, 27th November 1826,

The SOLICITOR-GENERAL in the Chair.

[There not being a Quorum of Commissioners, those present resolved to examine the Rev. Dr. Muir (as he had attended the Commission on two previous days without the Commissioners having been able to overtake his examination), and to report his evidence to the Commission. The evidence was reported to a meeting of the Commissioners on the 4th of December 1826, and was received by them, and ordered to be printed.]

The Reverend Dr. *William Muir*, one of the Ministers of the City of Edinburgh, called in and examined.

Rev. Dr. W. Muir.

27 November 1826.

The Commissioners are desirous of hearing any observations which have occurred to you in regard to the discipline or plan of Education pursued at this University, or any suggestions you may have to offer which you think likely to tend to the improvement of the Universities generally in Scotland?—Really the subject is so very general, one scarcely knows at what point to begin.

Is there anything that occurs to you in regard to the constitution of this University?—No, there is nothing. I do not consider myself as competent to judge upon that point. I have formed my opinion with regard to the manner in which the business and discipline of the classes ought to be conducted; but any observations I have to make may be brought within a very narrow compass indeed. In one sentence—the business and discipline of the classes ought in every thing to be directed for leading the student to exert—to think for himself. As the means of accomplishing so important an end, the system of lecturing, in the way in which it is generally conducted, is far from being useful. To make lectures beneficial, methods ought to be employed to ascertain whether the student be following them with intelligence. Lectures *are* indispensable; but to render them of real service, a plan of impressing the subjects of them by catechetical instructions ought to be practised as essential.

With a view to the accomplishment of this object, do you think that it would be necessary that such examinations should be pursued at a separate hour?—Decidedly so.

Would you make them daily examinations in all or any of the classes?—It has always occurred to me that there ought to be two hours every day employed in teaching in all the classes; I do not think the business can be well done except that time at least be devoted to it. One hour, or a portion of it, should be employed in lecturing; the other in conducting the examinations spoken of, and in receiving exercises in writing, both on the subjects of the lectures, and on such other subjects as may be prescribed by the Professor. Some of these exercises should be voluntary, but the greater number compulsory.

Are you of opinion that attendance upon these examinations is necessary, and should be made imperative on all the students?—It should be imperative for all useful purposes.

Do you apply that observation to all classes in every University, as well as to those in the University of Edinburgh in particular?—Most assuredly; I have no hesitation in applying it to all.

459

University of Edinburgh.

Rev. Dr. W. Muir.

27 November 1826.

Do you apply it to the Philosophical as well as to the Literary classes?—Certainly; and to the Theological not less than the others.

Have you had occasion, in the course of your own experience, to observe the good effects of that system of examination?—I had, in the University of Glasgow. At the time I was there, the system of examination was regularly followed. Two hours at least were employed every day in the business of the class,—one portion of the time in lecturing or in prescribing work, and another in examination, and also in the Professor's reading the Essays of the students, and commenting on them, or the students themselves reading their own productions, and receiving the observations of the Professor. Indeed, without the concomitant of regular examinations, the system of prescribing exercises to be done in writing is imperfect. On that supposition the Professor is left without the means of determining the reasonableness of the claim which his students make to the authorship of the essays they present. And I remember that we used to consider, in regard to the great Prize essays, on the merits of which the Senatus of the Glasgow University annually decided, that the honour awarded was valuable to the individual receiving it, only when the credibility of his pretensions was corroborated by the character he had established for himself through the course of the daily examinations. In truth, these regular examinations are necessary to give the student his standing.

Were any part of the exercises in the University of Glasgow composed or written, by the students in the different classes, in the presence of the Professors?—No, not in the presence of the Professors.

Were they composed in the class-room?—Not in the class-room; but I think the object to be gained by their having been composed there, was got at in the other way now spoken of; for while the system of stated examinations enabled the Professor to see what difficulties the student felt in apprehending the subjects of discourse, and gave the opportunity of explaining these, it likewise afforded that insight into the mind and acquisitions of the pupil, by which the false pretensions to literary production were checked. The character of the student rose out of numberless instances of diligence or neglect occurring in the course of daily work; and the opinion founded on these was almost infallible.

Was the number of Essays very numerous?—Very numerous. In the Logic class, for example, they were at first almost daily. No doubt at first they were both simple in the subject and short in the details; and perhaps little more than a transcript of the Professor's Lecture. But they enlarged by degrees, and, of course, as they enlarged in size, their numbers lessened. In regard to all, however, the scrutiny of the worthy and able Professor was diligently applied; the blunders were pointed out with fidelity, and the rules of composition illustrated and impressed by examples taken from the productions of the students. Indeed, such were the advantages of the Logic class, as then taught in Glasgow, that there is no one who had the privilege of passing through it, who does not trace to its honoured Professor the success he had in his initiatory studies, and does so with affection and gratitude.

Was the same system of examination pursued in the Philosophy classes?—The same system was pursued in the Philosophy classes. In the Natural Philosophy, there were, additional to the two hours of daily work in the public class, three hours a week employed in conducting experiments.

In the Moral Philosophy class did the students read any Latin?—They did through the whole year, at least a greater part of the year. And the books read were *Bacon's Novum Organum*, and *Cicero De Officiis*, and *De Finibus*.

Were the students very strictly examined in Latin?—Very strictly.

Did the Professor examine the exercises at home?—Regularly.

Does not this occupy a great deal of his time?—No doubt it does, but it is most profitably employed; and the result of it tells in carrying on the business of the class.

You do not conceive that it interferes with the progress of the Professor's own studies?—I do not see that; by a little management of time, it need not materially interfere with that: and yet, however great were the occupation in this way, it must be repeated that the result, for the advantage of the student, is most beneficial.

Did you observe any reluctance upon the part of the students to submit themselves to examination?—No.

Neither in the junior, nor in the advanced classes?—Neither in the one nor the other.

Was the Natural Philosophy class well attended?—Yes, very well.

Have you had an opportunity of comparing the progress of students who have been attending classes in the University of Edinburgh, corresponding with those of Glasgow, so as to judge of the effects of the system of instruction pursued here, compared with those of the system adopted there?—I have never entered into such a comparison with the view of ascertaining the merits of the system of instruction practised here and elsewhere. But I have had opportunities of observing not a few who have studied at the University of Edinburgh, and the progress made by them has disappointed my expectations. And though my opinion may, perhaps, be ascribed to partiality for the system of my own Alma Mater, yet I must say that I feel disposed to attribute the result to the want of that plan of regular examinations and other exercises which, as I have understood, are not so thoroughly introduced here.

Do you refer chiefly to their knowledge of languages?—I have observed instances in the department of composition, including in that, both the art of method and reasoning, and the style of English writing; and some striking instances in the department of the languages.

Have you had very frequent opportunities of examining young men who have attended the language classes in this University?—I have not had very frequent opportunities; but, in my official capacity, I have been called to examine young men who have been two, or three, or four years in the Language classes. What has puzzled me in these cases, has been a contra-

University of Edinburgh.

Rev. Dr. W. Muir.

27 November 1826.

riety between the attainments of the students, and the certificates they have brought. There has been such a difference as I could not at all account for.

Do you happen to know at what schools those persons were educated previous to going to College?—Yes; I knew those who were educated at Heriot's Hospital.

Did you know if some of the others were Bursars who had been educated at the High School, Edinburgh?—I was not aware at what school the others were educated. But as to those who passed through Heriot's Hospital, they did return to undergo examination by us, in a most lamentable state of deficiency. At the same time, I ought to say, I was not a member of the Committee who passed these boys when they left Heriot's Hospital to enter College, so that I do not know the extent of their acquisitions there. But, speaking in general, I have this to say, that if I were a member of the Committee, no boy applying for admission from Heriot's Hospital into the College, should be allowed to pass with my consent, having such puny acquisitions (as those youths had), after having been one, two, or three years attending at this school.

You did not conceive them to be fit to enter the College, even after having been three years there?—No, I did not.

Do you not think boys have greater opportunities of getting better instruction in Heriot's Hospital than in the generality of country schools?—Far better than in the *generality* of country schools.

Do you not consider the system of teaching Latin in Heriot's Hospital as quite superior?—Yes, I would say it is quite superior to the instruction that is to be got in many country schools, as far as I have had an opportunity of judging, though I do not think the system of classical study in Heriot's Hospital is conducted according to the very best principles.

Are there any further suggestions you have to offer as to the plan of Education or Discipline in this University, founded upon your observation of the practice at Glasgow?—On that important feature of the practice in the University of Glasgow already noticed, viz. the plan of Examination, I would state, that though the two first classes there, as taught when I attended them, were both distinguished by that beneficial discipline, yet, in the one class, it was maintained to a greater degree than in the other; and, if I remember distinctly, with a proportional advantage to the youth of that class, in which it was more carefully followed. The Humanity and Greek classes now referred to, were in that comparative state as to the plan in view. The Professor of Humanity called up for examination, twice, and generally thrice a-week, every student, without exception. The Professor of Greek, again, pursued (I shall not say altogether, but in a great measure) the plan of calling up the students, who would execute their tasks well, thus carrying on the business of the hour with fewer interruptions; and no doubt, as might be intended, with the hope of instructing and exciting those who had fallen behind in preparation, by the example of those who were farther advanced. But this latter plan, to the extent to which it was pursued, was hurtful. Fewer, of course, distinguished themselves in the Greek class than in the Latin, where every boy was required to read twice or thrice a-week. Besides, no student knew the precise time when he might be called on; and that also was a capital feature in the plan.

Do you think that it had the effect of securing greater attention?—Yes, it led, in a great majority of cases, to regular preparation.

Do you know if it is the practice in the Private Greek class at Glasgow to examine at all?—No, not in the Private Greek class, which is a different class altogether from what it is in this University. One circumstance ought to be mentioned with regard to it. The students from what is called the old side of the public class, attend it, who, at the usual hour of examination, are tried on the books read in it. Besides, the Private Greek class is open to students of every description, for whose improvement lectures on Philology, General Grammar, &c. are given at stated times.

How long is it the practice to attend the Public Greek Class at Glasgow?—I think three years, generally.

How many hours a-day are employed during those three years?—Two hours a-day, at least.

Every successive year?—Every successive year. The young side of the Greek Class was made up of those who, in the Humanity, ranked on the old side of the Latin, and were called *Ex Classe Latina;* then, of those who were properly *In Classe Græca;* and lastly, of those who took the Logic along with the Greek, and were named *Ex Classe Logica.* Many of us were wont to rank ourselves in these three orders, spending one year in each.

Is a fee paid every successive year?—Yes.

Is the fee for the second and third years of the same amount as for the first year?—Yes, but the private class is free.

Do you recollect the amount of fees for Logic?—I think the *minimum* was two guineas; it was so when I was there.

Does the instruction in Greek at Glasgow commence with the very elements of the language?—At that time it did, for there was no Rector's Class attached to the High School. Now, there is, and the elements of Greek are taught there, and the boys are able to read a little of the language before they pass into College, so that the drudgery of elementary tuition is got over in regard to those who have attended the High School. But still, there is a great influx of boys from country schools, who do not come provided with the elements of Greek, so that the Professor must devote a portion of his time, the first year, to drudgery in the elementary class.

Is it your opinion, that the teaching of the elements of Greek could be safely dispensed with in the Universities of Scotland, looking to the proportion of students who come from country schools?—It would be desirable that some provision should be made in the Parochial Schools,

4/01

University of Edinburgh.

Rev. Dr. W. Muir.

27 November 1826.

as well as in the Grammar Schools of our large towns, by which the teaching of the elements of Greek might be dispensed with. Still, even though that provision has not yet been made, there can be little doubt that, on the whole, the interests of Literature would be promoted by making it imperative, that the elements of the language be known before entering College.

Supposing such an arrangement were made, is it your opinion that a very considerable improvement would take place, probably, at no great length of time, in the Parochial and Grammar Schools?—Most assuredly; and, considering the great number of persons who are aspiring to the Church, without the least prospect of being provided for in it, there would be little difficulty in supplying the schools with teachers, who might be able to give the elements of Greek. On this subject it may be observed further, that owing to the want of such an arrangement as is referred to, and the shortness of the session, the Greek Class has been far from being so useful as it ought to be. The student, after being brought the length of reading a simple book in Greek, has arrived at the close of his first session in the study of the language, and is sent away to pursue it for himself during six months. When he returns to College, the Professor must go over the whole ground by way of revisal; and nearly six weeks or two months of the new session may escape without his advancing; and the short remainder be all the time given for leading him, during that year, to the higher acquisitions.

From such opportunities of observation as you have had, of the *circumstances* of the greater proportion of students at the University, when you attended, is it your opinion that the session might be considerably prolonged without very great inconvenience or hardship?—I do not know what particular amount of inconvenience or hardship might arise thence to the greater proportion of students. But if asked as to one evident means of promoting the interests of Literature, it is answered without hesitation, that the session ought to be prolonged. To boys, and even to students advanced in life, an absence from class-business and discipline, for the greater part of the year, is productive, in the majority of cases, of positive and incalculable mischief; attention is alienated from the object of pursuit, and habits of exertion and diligence are relaxed.

Do you believe that such an alteration would bear very hard upon the circumstances of many students, or do you think that the apprehension of such hardship is not a sufficient excuse for the shortness of the session?—I believe it would bear hard on the circumstances of many. But still, as already said, looking to the means of advancing the interests of Literature, the adoption of it can scarcely be withstood.

Have you any further observations to state to the Commissioners, in regard to the Language classes?—It is desirable, I think, that something of the discipline of the High School should be introduced to the Language classes at College. Little good, it is to be feared, can be done with the greater number of boys upon any other plan. In going from the High School, they go from a seminary in which they have been regularly and strictly drilled to the business of the class during nine or ten months in the year, and for four or five hours in the day; and under the powerful excitements to activity arising from the hope of rewards and the fear of punishments. And they enter a seminary in which the time of attendance is shortened; the check maintained over them is very slight; the examinations into their progress few; and where, in too many cases, the temptation is strong to assume prematurely the habits of young gentlemen, raised above all control. The inducements to indolence are rendered powerful by opportunity, and in the experience of vast numbers are irresistible.

Has any thing occurred to you as to the means of ensuring and ascertaining attendance upon the part of the students?—I do not think there is any plan better adapted to ensure and ascertain attendance than the one already spoken of, which supposes the regular calling of the catalogue. Frequent, unceasing examinations of a class will expose the absentees.

Did you find any inconvenience at Glasgow from calling a catalogue every day?—No inconvenience. It was regularly called every hour; six minutes did it.

What year was it when that was done?—The year 1801, and upwards till I left College, is the time to which I refer.

How many might the Greek class consist of in your time, or the Latin class?—I think about 130 in the Humanity, and about 150 in the Greek. The private Greek class might be attended, if I recollect right, by more than 200.

How many might there be at examination hours, for instance?—As stated above, I may mention as a curious fact, showing the rapid increase of students at the Glasgow University, that during the fifteen years after 1803, the students at the Humanity class had increased from about 140 to 400.

From your own knowledge, what might the numbers be at the time you were there, and when you say no inconvenience arose from calling the catalogue?—I have said there were about 150 in the Greek class when I attended it.

You say the catalogue of that class was called without inconvenience in the course of a few minutes?—It was called every hour regularly, without inconvenience.

Have you reason to think that the examinations are less frequent in the Language classes in the University of Edinburgh than in that of Glasgow?—I have always understood so. I have nothing but the report of some of those who have attended these classes. And whenever it came to be a question, with regard to them, why they were not called up more frequently, they have usually answered the question by speaking of being neglected. But caution is requisite in receiving their reports. Perhaps, in some cases, there may be non-attendance on the part of the reporters.

Are there any further observations you have to offer upon the subject of the Philosophical classes, in addition to those you have already stated?—I have often demurred a good deal about the utility of the arrangement of these classes.

University of Edinburgh.

Rev. Dr. W. Muir.

27 November 1826.

Do you mean the order in which they are attended, or the distribution of subjects?—The order in which they are attended.

Will you have the goodness to favour the Commissioners with your remarks upon that subject?—There is reason, I think, to doubt the utility of the arrangement which prescribes Logic and Moral Philosophy, in immediate succession to Classical studies. According to the method in which Logic and Moral Philosophy are commonly taught, the first thing done is to lead the student into the discussions on Mind, which, in the one class, are introductory to rules of Composition and Reasoning—and in the other, to the Rules of Moral Duty. The mind is thus turned to the subtle speculations on its own powers, before it has been trained to habits of close attention and careful induction. In turning the student at once, without any such training, to such a subject, the risk is great of inducing on him the habit of inaccurate thinking. It is true, the excellent method of conducting the Logic class at Glasgow, which obtained under its venerable Professor, made it an useful class even with that drawback. But by a postponing of the time of entering it, I think it would have been more useful still. The study of Mathematics might be more profitably entered on, immediately after the classes of Language.

To what length would you propose to carry the study of Mathematics, before the student went to the Logic or Moral Philosophy class?—As far as might enable him to begin with profit the study of Natural Philosophy.

Would you make the study of Natural Philosophy precede Logic?—Yes; still I suggest that with very great diffidence; I shall not say positively it would be a beneficial thing; I have often thought it would, and for the reasons mentioned.

Do you not think Natural History would be a very proper study at an early part of the Academical course?—Natural History is an interesting study, and may well be combined, to a certain extent, with the others. The desirable object, however, is, to propose and follow out the course of study in which the powers of the mind, as they are opening into strength, shall be called to exert themselves with vigour and diligence. Habits of masculine thought are by all means to be formed. A *premature* introduction to what is merely entertaining, especially into the flowery path of literature, ought to be avoided. Many a mind has had to bewail that premature introduction.

Do you conceive that there is any great use in teaching Logic, before a store of facts is laid up in the mind?—No, I do not think there is; and that is one reason why Logic should be postponed.

You do not consider Mathematics alone as being sufficient to store their minds for that purpose?—Natural Philosophy should be combined with it, and Mathematics should be made introductory to the study of Natural Philosophy, and accompany it.

Do any observations occur to you, in regard to the manner in which degrees in Arts are taken in the Scotch Universities, with a view to improve the manner in which they are granted, so as to render them greater objects of value and estimation?—In referring to the manner in which class-business and discipline were, on the whole, conducted in the Glasgow University, when I was there, I would say, that upon that plan there is little need for a change of procedure. By strictly following out the plan which was there sanctioned and professedly acted on, the degree of Master of Arts is to be conferred, not only in consequence of a formal examination to which the candidate for the honour is subjected at the time of applying for it, but in consequence also of an appreciation of his character as a student, which has all along been made by the examinations and exercises which composed the ordinary business and discipline of his classes; and not by these merely, but by a trial of his abilities and acquisitions, to which he has regularly been subjected in passing from one class to another. This last circumstance is a very important feature in the system at the Glasgow University.

Is that what is called the Black-stone examination?—Yes.

Do you consider that as a useful check upon students?—In every respect it is most beneficial. Though the examination be not a long one, and perhaps not a very minute one, yet it has the effect of exciting the students, and of inducing them to remember what they have got; and though I am not aware of any instance in which a student has been turned back, yet still the Professors have the power of turning him back, and the knowledge of that is a strong inducement to diligence.

Does that examination take place before, or after the student has entered the class which he has proposed to join?—After he has entered the class, which would make the disgrace greater if he were turned back.

Is it not your conviction that some of them ought to have been turned back?—I have no recollection of any particular case, in which a student ought to have been turned back.

May not the circumstance, that the fee is already paid to the Professor by the student, operate considerably in rendering that examination more lenient than it ought to be?—The institution is a beneficial one in practice, whatever doubts may be entertained of it on such grounds. If one Professor lost a fee by turning a student back, another would gain it; and the Professor whose class has been left is the Examinator, as well as he whose class has been entered.

In regard to the distribution of the subjects of the Philosophical classes, have any observations occurred to you?—No; there is nothing that occurs to me on that point, except that there might be advantage gained from a subdivision of subjects. In the University of Glasgow, for example, there is no separate Professor of Rhetoric. This branch is given to the Professor of Logic.

Do you consider the separation of those two subjects into two distinct classes, to be of any utility?—I think it is desirable to have a subdivision of these subjects, as one instance.

463

University of, Edinburgh.

Rev. Dr. W. Muir.

27 November 1826.

Would you propose that Rhetoric should precede Logic, in any University where there is a subdivision?—No, I would not have it precede Logic; I think it should follow.

Do any of the Professors at Glasgow profess to lecture in a great measure extemporaneously?—No. The Professor of Logic, to whose plans reference has already been made, did not lecture extemporaneously; but the manner in which he used his written lectures, gave them all the beneficial effects which, in the way of rendering a subject plainer and more familiar, usually arise from an extemporaneous lecture, as delivered by a man of ability and ample resources. He went back on the longer paragraphs; he broke them down into small portions; he altered the arrangement of their clauses; he cast them into easy modes of expression; and, in short, took great pains to impress the subject of them on the mind of his students.

Do you think that practice would, in most hands, be favourable to the attainment of precision, and perspicuity, and elegance?—I am supposing that the Professor uses lectures composed with as much regard to elegance and precision as the perspicuity in treating his subject will allow. In having such lectures, and both reading them and using them as a guide in the new illustrations and enlargement, I do not see how any bad effects on the ground mentioned should follow. Every method, surely, ought to be employed by the Professor to make his students comprehend what he is doing; and this is often best to be accomplished by throwing in occasionally such additional views and illustrations, as the state of the class may be found to require, by going back to the points which may not have been so fully brought out—by interspersing, in easy colloquy, an abundance of synonymous terms, a free use of which is often very beneficial for expounding truth to inquirers.

In any of the classes at Glasgow, were the Professors in the habit of directing the students to read particular works, and afterwards examining them upon the subject of such works?—No, I am sorry to say, that plan was not adopted; at least, to any great extent.

Do you think that that system of instruction might be advantageously combined with the system of conveying instruction by lectures?—Not only do I think that there is advantage in combining it with the system of lecturing, but I do not see that the system of lecturing upon any subject can be useful without it. Looking to the higher classes, such as Moral Philosophy and Divinity and Church History, I do not see how it is possible, by the mere reading of lectures, without directing the students to the sources from which the subjects are drawn, and without regularly examining them upon the lectures, and those books to which reference has been made, that much benefit can be derived.

While you were at the University of Glasgow, did you consider that the students had the full use they might have had of the Library of the University?—At the early part of my course they had; but there was unfortunately some dilapidation went on in the University Library, which induced the Professors to be a little more careful in giving out books. The rate of admission was made somewhat higher, and the students were called upon to make a deposit as a guarantee for the return of the book. But I believe that did not operate to any extent in the way of hardship, or produce any obstacle to any student disposed to carry on his inquiries; that is, with regard to the University Library. A small library is attached to each class in the College, and the books are selected chiefly by the Professor; he takes such books as he thinks his students may be the better for in prosecuting the particular studies of that class. Then with regard to the Divinity Hall in Glasgow, there is an excellent library attached to it, which is wholly under the management of a Committee of the students, who conduct it with great propriety, and great facility is given in the use of that library to those who are engaged in the prosecution of their Theological studies.

Is there a considerable number of copies of the most useful books?—I cannot say that there is a considerable number of copies, but there are several copies of those books which are most frequently consulted by the students. I recollect well when I was at the Hall, I thought that was a department in it which admiited of some amendment,—the multiplying copies of books that were frequently consulted. I understand since that time they have gone on increasing the number of those books which are most consulted.

Are there any further observations which occur to you relative to the Literary or Philosophical classes, or upon the system of education or discipline of the Universities of Scotland, before proceeding to the consideration of the Theological Faculty?—In addition to the observations made, I beg leave particularly to suggest the absolute necessity of prolonging the time of study.

Do you mean lengthening the term of the session?—Yes, lengthening the term of the session; I think that is quite necessary.

Would you conceive four years' attendance upon the Literary and Philosophical classes by those who propose to enter the Church, sufficient, if the session were lengthened?—Yes. I should think if the session were lengthened, and some progress in Greek made before entering College, that five years at the very utmost were sufficient. In that case even four might be enough.

Is it your opinion that it would be an advantage to add another session for the previous education of students intended for the Church, in order to secure some attainment in the knowledge of the Hebrew language before they enter Divinity Hall; during which additional year they might also prosecute some of the Physical Sciences further?—Yes, I think it would be a desirable thing for the intended student of Divinity to have some knowledge of Hebrew in that way; but I do not think that one year of studying that language as a preliminary to his entering the Hall, should finish his course of attendance on the Hebrew class, as essential to the study of Divinity.

Would you propose he should attend it the first year after attending Divinity Hall?—One year,—I would not say the first year,—but one year during the time he is at the Hall.

University of Edinburgh.

Rev. Dr. W. Muir.

27 November 1826.

Do you consider that the addition of a fifth year of attendance at the University for students intended for the Church would be a material hardship upon the greater proportion of students?—I believe, with regard to the greater portion of students who are pressing forward to the Church, it is a very desirable thing to have the course of attendance upon College curtailed as much as possible; but still, if the great object of promoting Theological Literature is to be accomplished, I think that is an item which should be thrown out of calculation.

Is the number of young men at present pressing forward to the Church, such as to render it, in your opinion, unlikely that the interests of the Church would suffer from such an alteration, even though a few should thereby be impeded or discouraged?—So far from the interests of the Church suffering, I have always been of opinion that the substantial interests of the Church would be promoted by lessening the numbers of those who are pressing into it; and for this, among other reasons, that as it is altogether impossible they can be provided for, there will be multiplied over the country the numbers of those who, as preachers, bear a clerical character—and they, being under the necessity, for the purpose of procuring subsistence, to betake themselves to pursuits that may not be professional—the same bad effect may ensue as often takes place in the south, from the manner in which many of the poorer clergy are compelled to support themselves. An unfavourable impression, weakening to the useful influence of the clergy, is thereby produced.

Is it your impression that the generality of preachers are generally capable of teaching Greek, and that they might be beneficially employed in teaching a better order of schools than are now established in the parishes throughout Scotland?—Certainly, if the previous plan of instruction in the Greek language in our Universities were improved, you might expect to have the favourable result by which so desirable an object would be gained.

Which at present you hardly look for?—I think not, generally.

Do you think at present, that it would be easy to get a sufficient number of men to fill the parish schools of Scotland in such a manner as to supersede the necessity of teaching the first Greek classes in the Scotch Universities?—I fear not; I should be very much afraid not.

Will you proceed to state any suggestions that occur to you in regard to the study of Divinity in the Universities of Scotland?—The opinion I have formed on that important subject does not coincide with the plan that has usually been followed in teaching Theology; the usual plan being such as leads me to doubt whether the interests of Theological Literature can extensively flourish under it. Referring to the manner in which the Theological class was taught when I attended it, I am obliged to confess that, under the tuition even of a most learned, and laborious, and pious divine, whom every one venerated, and justly so, the Hall was a place of little profit. To the greater number who attended it could scarcely be otherwise. A lecture, no doubt, displaying extensive research, was given. But no examination on the subject of it ever was held. References were made to a multiplicity of books on Theology. But no selection of such as might be easily got was pointed out, and no inquiry instituted as to what the students were reading. The usual number of discourses were called for. But the composing of one during the first year of the student's attendance was discouraged; and with the exception of these discourses no method remained to the Professor for ascertaining what his charge were about. It occurs to me that a similar plan to what was proposed for other classes ought to obtain in the Hall. There ought to be two hours of meeting every day; and the time divided between lecturing, examinations on the subjects of the lectures, reading portions of the sacred classics, both out of the Old and New Testaments, besides other exercises, prescribed and voluntary, which may be given out. In order to accomplish these things well, there might be a profitable distribution of subjects among the Professors of what is called the Theological Faculty. I will not take it on me to suggest the manner in which that may be best done. But certainly a new division of labour in this department is extremely desirable. There is, for example, one branch of Theological Literature, of which the students of Divinity in our Church are, for the most part, very ignorant; I mean the writings of the ancient Fathers. The clergy of the Roman Catholic Church usually attend to these with diligence, and are well versed in them. They are not so well versed in the Sacred Scriptures as Protestant divines are. In that they are much to be blamed. But there seems to be no good reason why we should not have the opportunity and the excitement to add the other to our Biblical knowledge. I have often thought that the Professor of Church History, instead of spending the time so much in giving in his lectures a detail of facts, (which might be gained from books in private,) might, along with abridged views of facts, and disquisitions on their causes, be usefully employed in reading with his students the works of the Latin and Greek Fathers, making selections from them, and introducing with these readings sketches of the periods to which they belong. This last, it occurs to me, might be an exceedingly interesting and very useful way of giving instruction in Church History.

Do you understand that the Professors of Church History have generally in their lectures confined themselves to the dry detail of facts?—I refer only to my own experience.

Is Dr. Muir of opinion that the system of irregular or partial attendance at the Divinity Hall is detrimental to the interests of learning and religion, and to the character of the Church of Scotland?—I am of opinion, and always have been, that it is utterly detrimental to them to the extent to which it prevails. In itself it is a perfect anomaly, and the origin of it to be accounted for only by referring to a period when the applicants to the Church were few in number, and it was thought necessary to hold out a *bonus* to induce them to come forward. But now that circumstances are altered, the practice, for the interests of Theological Literature, ought to be abolished.

What period of attendance upon the Theological classes would you be inclined to recom-

4/65

University of Edinburgh.

Rev. Dr. W. Muir.

27 November 1826.

mend, supposing irregular attendance shall be entirely done away, and a proper and regular system established?—I do not see, with regular attendance, that there would be any necessity for extending the period beyond four years. The same remark that was made with regard to the other classes ought to be made here, that the Session should be prolonged.

Would it be no objection to that system, in your opinion, that the period at which young men would be able to enter the Church, would in that way be postponed?—I scarcely think it would be postponed. There are so many now who enter the Church after irregular attendance (six years' enrolment being required from the irregular students), that no loss of time would really ensue.

Supposing such a regular and proper system were established for conducting the study of Theology in the Universities of Scotland, is it your opinion that any additional class, such as that of Biblical Criticism, might be established with advantage?—It is of the greatest importance that the study of Biblical Criticism should be pursued with vigour. I am not aware, however, of any objection to its being conducted by the members of the Theological Faculty, as it is at present composed, without an additional Professor. I do not see why the Professor of Hebrew should not bear his share in it along with the Professor of Divinity. Conducting the department of Biblical Criticism, I think, would fall very much in his way.

Would you propose that the Professor of Hebrew should teach his class for three years?—It might be so with great advantage.

Do you think that in that way the subjects might be sufficiently overtaken by the different Professors?—I think so, supposing the students are attending regularly, and the session is prolonged, and the Professors of the Theological Faculty make the proper distribution and arrangement among the subjects of their departments. A greater attention to Biblical Criticism than has hitherto prevailed, appears to be necessary to promote Theological Literature, and to fit the Clergy for their great work, as expounders of the Divine Scriptures.

Supposing regular attendance at Divinity Hall for four years should be enjoined, in what way would you propose that the Divinity class, properly so called, should be taught,—would you propose that there should be, first an Elementary class for one year, and then a full course for three years; or in what other method would you recommend that the class should be taught?—It has occurred to me that great good might arise from (what may, perhaps, be deemed somewhat laborious and difficult) a strict examination of Intrants to Divinity Hall, for the purpose of ascertaining their acquisitions,—how far they have prosecuted their studies in General Literature, and with what success. While these Intrants formed an Elementary class in the Hall, they themselves might again be usefully divided into an old and young side, the Exercises prescribed to them taking a character from the standing of those to whom they are prescribed. In truth, in the Divinity Hall, there should be something conveyed of the discipline that takes place in the other classes.

Is that an opinion founded upon your observation of the different state of the acquirements of those whom you have seen entering the Hall?—The acquirements of students entering the Hall are, of course, extremely varied. But I found the suggestion on the absolute need there is for the careful superintendence which the arrangement proposed must require. The experience of an opposite mode of procedure, by which every student was left to pursue his inquiries *ad libitum*, impresses me deeply with the need and the value of a closer inspection and greater incitement in conducting Theological studies. When there is no such superintendence, and no direction to study given, on some knowledge of the acquirements of the persons directed, the student has often lasting cause to mourn over the time he lost in his ignorance how to turn himself, left to grope a way for himself, and not even told what books he should read. In the Interim Act of 1803, and repeated during successive years, the Church makes provision for following out the plan of superintendence. But then one part of that act renders another useless; for while the Professor is required to take a regular superintendence of his students, the act allows, to as many as please, to substitute enrolment for attendance.

Supposing such an examination were to take place, in regard to the acquirements of different students when they enter the Divinity Hall, as you have suggested, what is the system of instruction you would recommend in the Divinity class?—On the supposition now made, it will lie with the Professor to point out the books to be read and the exercises to be performed by his students, according to the divisions by which he has arranged them, and their standing in the Hall. There may come to be felt, no doubt, a difficulty with regard to the order of instruction in a class composed of these separate portions. That difficulty, however, is also experienced in the earlier classes, and the arrangements of the Professor have the overcoming it in view. In regard to the Hall, an arrangement among the divisions and the hours might, perhaps, be practicable. Even though there were an alternating of hours between a higher and lower division, the curtailment of the daily time of attendance might be endured without injury. At each hour the number attending would be smaller, and consequently more manageable. But it is not easy to enter into details on such a subject. A little practice will suggest many useful expedients.

Do you think that a full Course of Divinity may be embraced within three years, supposing the session is prolonged?—I would say four years.

Supposing the Professor of Systematic Divinity were to give a sort of outline of the whole heads of the course the first year, and then the extended course for the three subsequent years, do you consider that that would be sufficient?—Yes, quite sufficient.

Would you think that plan better than a course lasting for four years, when the student might, perhaps, enter the second or third year, without having had any general systematic view presented to him in the first instance?—I do most assuredly think so.

What number of exercises do you think ought to be performed by the Theological students?—There ought to be a great number; I could not take upon myself to say what number.

University of Edinburgh.

Rev. Dr. W. Muir.

27 November 1826.

Do you consider the present number of Discourses required of the students, by the act of the Assembly, sufficient to afford a specimen of their progress?—Not sufficient to afford a specimen of progress; nor by themselves are they so useful. Sermon-writing by itself is not in the first instance so profitable for students of Divinity. Along with attempts at Sermon-writing, the advantage would be great to exercise them in composing Essays on Theological subjects.

Would you require those exercises, to which you allude, very frequently?—Yes; and I would have at the same time voluntary exercises, so as to give materials for working to the more diligent students.

Would you not propose to abolish that particular description of task, which is called Exercise and Addition?—No; I would rather propose that more specimens of it were demanded. Such exercises would be well prescribed in connexion with a course of Biblical Criticism.

Would you have exercises both from the Old and New Testament?—Yes, certainly; that would be rendered quite practicable upon the previous plan of having a Hebrew class, as preliminary to entering upon the study of Theology.

Do you think these exercises ought to take place weekly?—Very frequently; the length of them is not what is of so much consequence,—it is rather the system of keeping the students at perpetual work that is so desirable.

What, in your opinion, ought to be the nature of a Homily?—It is very much the same as an Essay.

Do you think it is in the nature of a familiar Discourse, or is it one that requires particular research?—The specimens of a Homily, as we have them in the writings of the Fathers, are peculiar. There is no strict method proposed, or often even maintained in them. They exhibit little research.

As a great proportion of the time of the Professor of Divinity is consumed in hearing the Discourses which the Church prescribes before licensing students to preach, is it your opinion that the Professor of Divinity might be lightened of any part of that duty by any other Professor?—I think the evil complained of will in part be remedied, by declaring that there is to be no irregular attendance; because, on account of the irregularity of attendance, it is commonly at the end of the session, when the students crowd in from the country, that the occasions of hearing discourses are so multiplied as to become burdensome. If the Professor had all his students, and always near him, he might be able to make arrangements with them for spreading the discourses more equally over the session; and then, were the session itself prolonged, the necessity of hearing many discourses at one time would be diminished.

Is it not probable that, if such a regular system of study of Divinity were introduced into the different Colleges, as has now been contemplated, the Church might say, that by these exercises the object proposed was much more than gained, without the necessity of requiring so many *long formal discourses* to be delivered, which, with a number of 100 or 200 students, must occupy so much time?—I do not see how the number of discourses prescribed by the Church could rightly be diminished. I am supposing the other exercises, that are prescribed by the Professor, are more in the way of Essays. I do not think it a proper thing to diminish the number of discourses; but to accomplish the object in view, if it be determined to have regular attendance and the session prolonged, the necessity of hearing many discourses at one time would be diminished.

Might it not be expedient that the Principals of the different Colleges should take a part in hearing the discourses, and superintending the instruction of students of Divinity?—It certainly would be expedient, and a very desirable thing, so to lighten the duties of the Professor of Divinity, provided a judicious subdivision and arrangement of labour were effected.

Might there not be an advantage, if the Principal delivered lectures upon some parts of the subject, seeing that its extent renders it frequently difficult for the Professor of Divinity to get through a Systematic Course of Divinity?—That would depend upon the manner in which Systematic Divinity should be lectured upon. The manner in which it has been generally done, has always appeared to me, for any purpose of utility, to be exceedingly faulty. The common plan has been to introduce every thing that can be introduced into the lectures, and to enter so much into the details of the subject, as to extend the course through four, five, or even six sessions. Thus, not unfrequently has it happened, that students, even with regular attendance, have entered and left the Hall without hearing the beginning or end of the system, and gone away with mere fragments. Lectures were more useful, it is apprehended, did they consist of grouping views, grand outlines, and prominent points of the subject—with ample references to the sources from which materials have been drawn; while, on the books recommended to be read, there were stated examinations and writing of Essays. Without these, I doubt if much good is to be derived from the system of mere lecturing.

Have any part of the improvements you have alluded to been pursued in any of the Universities, unless in late years?—I am not aware.

Are there any further suggestions you have to offer, with a view to the assistance of the Professor of Divinity?—It is in the department of Biblical Criticism, that any lightening of the labour of the Professor of Divinity might be profitably given.

Might not many of the branches of Biblical Criticism, or subjects of that description, be very advantageously lectured upon by the Principal, so that it should not interfere much with the Theological Course?—Certainly they might.

Is it not understood that, until a recent period, the Principal of the College of Glasgow was in the habit of performing some duty of that description, or of delivering a course of lectures connected with the study of Theology?—Yes, Principal Leishman was in the habit of giving Theological lectures.

467

University of Edinburgh.

Rev. Dr. W. Muir.

27 November 1826.

Are you aware upon what subjects Principal Leishman delivered the lectures to which you allude, or in what way attendance upon his class was reconciled with the general plan of study required of the Theological students?—Why, if I am rightly informed of the manner in which the Principal conducted these lectures, they were delivered on stated evenings to students of Theology in the Common Hall; and, if I mistake not, they were lectures upon the Evidences of Christianity. But I cannot say that I am very minutely informed of that fact.

Are there any other observations which occur to you upon the subject of the Divinity class?—Nothing farther, except this, that much good may arise, both for the improvement of the students and the interests of the Church, by the Professor of Divinity having more intimate intercourse with those under his care, in the way of private counsel, in addition to what he does at the hours of teaching.

In regard to the class of Church History, are there any observations which you have to make as to the mode in which it is generally taught?—No; there is nothing further occurs to me, beyond what I have mentioned. I am decidedly of opinion, that the mere detail of facts to the students who attend that class is quite useless.

Is there any reason why the Professor of Church History should not lecture every day?—I see no reason.

Is it the case at Glasgow?—It is not; he lectures only three times a-week.

Would you introduce a system of examination into that class?—Clearly; not only upon the lectures, but upon the books to which reference may be made by the Professor.

In regard to the class of Hebrew and Oriental Languages, have you any observations to make which you think will be useful?—No, I have no observation to make upon that.

Do you consider that the study of Hebrew has been sufficiently cultivated by the Clergy of the Church of Scotland in general?—Unfortunately not; it has of late years revived, and happily revived.

Would not the increased length of the Session, and the reading of the Sacred Classics in the Divinity class, tend greatly to facilitate the study of Hebrew?—It is desirable, and it is what ought to be done for that end.

Would the mode of instruction in the class of Ecclesiastical History, to which you have alluded, combined with reading some portions of the Fathers in Latin and Greek, have a tendency to keep up the Classical Literature of students of Divinity, while attending the Hall?—Surely.

At present, are no Fees paid by the Divinity students?—None.

Is it your opinion that fees might be exacted from Divinity students, or do you consider that that would be a prejudicial change?—According to experience, I think those classes are better attended where fees are paid, and therefore it is fit to be considered whether the same thing should not be exacted in the Divinity Hall. At the same time, very few Professors of Divinity would like to be the instruments in introducing such a change, and many students might feel it as a hardship.

Do you think the change would operate as any material hardship upon the greater proportion of the students of Divinity?—Yes, I do; and, if all the other changes that are contemplated be introduced, particularly that of exacting regular attendance, and prolonging the session, so as materially to increase the expenditure of the students, it were far better to wave that proposal.

Do you think it would be a greater hardship for students to pay fees during the course of Theological studies, than during their attendance upon the Literary and Philosophical classes?—In this way it would, that their expenditure is, by the other arrangement suggested, to be much increased.

Are students of Divinity able, generally, in some measure, to support themselves by teaching, or by their literary labours?—Certainly; but, according to these previous plans, the means of the students would be curtailed considerably. There are not a few who are now irregular students of Theology, supporting themselves by teaching in the country. If the other plans were adopted for the promotion of Theological literature, it were far better, as I have said, to wave this proposal.

Do you consider that young men are fully as well prepared for the duty of tutors in gentlemen's families, at the conclusion of their Philosophical course, as they are after having studied Divinity for three or four years—are they as fully prepared to act as tutors at the age of eighteen, for instance?—I would say, in a greater number of cases they would enter with greater effect as tutors, after having spent other four years at an University in addition to their Philosophical course. But in regard to the particular effect produced by such a change upon many of the students, I am not aware, judging of the matter with a view to the great interests of literature in general, that that is an item that is to be taken into calculation.

Under the present system of irregular attendance at Divinity Hall, does not the progress of the students in Theological study seem to depend (with the exception of one year's attendance at the College) entirely upon their individual exertions?—Yes, wholly upon that, and in situations frequently where they are almost cut off from any inducement to make exertions; very often they are removed to distant parts of the country, where they have access to no library, and mix with any, rather than clerical society, or such as will keep up their habits of study.

Have you had opportunities of comparing the attainments of the regular and irregular students, either at the Presbyterian examinations or otherwise?—I cannot now charge my memory with any facts that induced me to draw that comparative estimate; but I can state generally, that I have seen and deplored, in more instances than one, the mischievous effects of students being banished away to distant parts of the country; and the deteriorating influence

University of Edinburgh.

Rev. Dr. W. Muir.

27 November 1826.

of such a system upon all their habits of study, upon all their modes of thinking and feeling with regard to professional objects. I can say, I have had many instances in which I have seen the bad effects of it illustrated.

You conceive, then, that during their attendance at the University, there are many other sources of improvement, besides listening to lectures?—Most assuredly; their very intercourse with other students, and the beneficial influence of literary society, and particularly of Presbyterial society. I think that is a very important thing—I may mention one instance that occurred in my own observation of the bad effects of being removed to a distance from the seat of the University,—and I could mention others,—the case of a student who had distinguished himself at the University, but who, in his banishment (for really it was nothing else than banishment), had access to no clerical society, and to no library. He returned deteriorated in every respect. The only books to which he had access were two odd volumes of Blair's Sermons. He had few books of his own. That is only one of many instances.

With regard to the accomplishment of changes and improvements, to which reference has been now made, in a system of Theological study, is it your opinion that advantage would be derived from this Commission making any recommendation on this subject, so as to leave the matter to the determination of the Church, after considering such recommendation; or do you think that regulations by this Commission should precede the adoption of those changes by the Church, leaving out of view any reference to the question of authority or power, and speaking solely with reference to the most expedient manner of accomplishing the change?—I am not Church-lawyer enough to decide upon that point. We are very tardy in making laws in our Church; still, if it could be accomplished, it would go down with greater power if it emanated from the Church.

Do you consider that any recommendation from the Commission would influence the opinions of the Church?—I have no doubt any recommendation from them, after their labours in this investigation, would be listened to with the utmost attention and respect.

Considering the jealousy some might entertain, and the objections others might have to the proposed plan; recollecting also, on the one hand, that the Church have it in their power to license those only who have followed that system of instruction which they themselves may think fit to require, and, on the other hand, that the Academic authorities can regulate the studies within the different Universities; would you wish to see the object in question carried into effect in the latter method, before the Church had introduced more material changes and improvements in the system which they consider necessary for the study of Divinity; or do you think, in the first instance, that the Church should be allowed to make those improvements which should be followed out afterwards by the regulations of Academical authority?—Any regulations the University might make, as to the attendance at the Divinity Hall, would, of course, be useless, if students applying to Presbyteries might still obtain licences from the Church upon the old plan.

Supposing regulations were passed by some Academical authority, by which attendance at Divinity Hall should be prescribed for the period to which you have alluded, for a certain number of sessions, (those sessions being prolonged, and the Professors not being allowed to give certificates to any who had not gone through that attendance,) is it your opinion that the Church would be at all inclined to license Preachers without regard to such regulations?—I think it would be a very unfortunate thing to bring the two authorities into collision; it would be better if any method could be fallen upon, by which improvements should be introduced by a mutual good understanding. But at the same time, the high importance of introducing these would induce me to think, that the attempt at such an understanding should be made without delay—and that, in the mean while, for the sake of Literature and Science, the Universities should endeavour to bring in as much of them as they can.

Is it your opinion, looking to the present state of opinions in the Church upon this subject, that by means of a recommendation from this Commission, the proposed changes would be much accelerated?—I have no opportunity of judging—I could not say. I know very little of what is going on in the Church; I am not able to state in what way such a proposition would be received. But I apprehend that the refusal of it is to keep back the improvement of our Theological Literature.

Supposing that the leading persons in the Church,—those who generally take the lead in the business of the General Assembly,—were to concur with the Commissioners in recommending such a measure, do you think it probable there would be much opposition to it throughout the Church generally?—From the effect that would be produced upon many who are now proposing to enter our Church, and perhaps from old recollections and habits on the part of many of the ministers of the Church, as well as from other causes, the opposition might be considerable.

For what period would you propose the session should be prolonged?—At all events it ought not to be less than eight or nine months. I would say eight months.

Do you mean for the Literary, Philosophical, and Theological classes?—Yes.

Do you apprehend that there would be any particular mischief or evil result from taking fees of the students of Divinity?—You would increase so much the more the expenditure of the student of Divinity by requiring him to attend regularly for eight months instead of six. I would rather wave this, which would be a considerable item to his burden, and it would render your changes less palatable, if along with them you were to propose this addition.

Are there any other suggestions you have to offer upon the subject of the Theological class and the study of Divinity?—No, nothing further occurs to me. There is, however, one general point with regard to the whole of the classes in the University which I use the freedom to touch on. I have always thought it would be a very desirable thing if some method were fallen upon in all the classes, by which there might be a recognition of the principles of

Christianity in our Universities. There might be put into the hands of the students in every class, some small manual containing an abridged but clear view of the evidences of Christianity, and its leading doctrines; and this they might be called upon to commit to memory; and at stated times be examined on it. Thus an excellent instrument were prepared for the Professor, by which, if disposed, he might impress deeply on the minds of young men, at the most dangerous period of life for receiving sceptical notions, the principles of religion, while a most acceptable office were done for parents at a distance.

Do you make that suggestion with a view to the general students?—Yes, to the whole classes. One thing is obvious, that in our Universities there is little recognition of the established religion. It is not so in the south.

Have you attended to the great difficulty there would be in the way of carrying that suggestion into effect, from the variety of persons who come from all quarters of the world to this University, and who belong to very different churches and sects?—That difficulty does not appear to have been attended to in the southern Universities. There I am aware the conformity is too great; there is an exaction made which excludes all conscientious dissenters, or which turns dissenters into hypocrites. I do not think there is any necessity to go that length. But still I do not see why such a manual as has been referred to, might not be introduced with advantage. The using of a well composed treatise, containing a view of the evidences and doctrines of Christianity, could scarcely be objected to on the part of the Professors, who have all either subscribed, or declared their willingness to subscribe, to the standards of the National Church.

Does it occur to your recollection that, in 1647, the General Assembly required the Masters and Professors in the University to examine their students weekly upon the principles of the Christian religion?—I cannot remember the year, but I have a distinct recollection of an act to that effect.

Would you propose that such a manual as that ought to be drawn up by the University, or should be one for which the University is responsible; or would you leave it entirely to the discretion of the individual Professors to adopt such a manual as they themselves would approve of?—It would be necessary to have a check somewhere; it would occur to me that each Professor might be allowed to follow his own plan, but subject to the revision of the Church.

Do you think such a manual could be drawn up, that could conscientiously state the leading principles of Christianity, without touching any of the disputed tenets of different persons?—No, it could not, after you had passed beyond a view of the evidences of Christianity.

Could you give the evidences from Prophecy, in a manual, without touching some of the leading tenets of different persons?—Why, if it be absolutely necessary to avoid touching the leading tenets, it might be possible to give a circumscribed view even of that evidence, without largely traversing any disputed point. But I do not see why the peculiar tenets of Christianity should be avoided. It would not occur to me that there was any objection to it, considering that the Universities are under the superintendence of a Church, whose tenets are of the description which it is well enough known they are. And in legislating for Universities, placed under the immediate superintendence of such a Church, there seems to be less necessity for too great a deference to those whose opinions are decidedly hostile to hers.

Would not such a system amount to a test of opinion, before admittance into the University as a seminary of education?—Suppose we look on the subjects referred to merely as a branch of knowledge, why should there not be means employed to keep up the student's acquaintance with the religion of his country? Indescribable pains are often taken to preserve his acquaintance with the mythology of Greece and Rome, and there does not seem to be any good reason why the true religion should be neglected.

If you make a manual, in which you ask a student certain questions, and require him to answer them in certain words, would not that, with an intelligent and conscientious student, amount to a test?—If, on the part of the students, the use of such a manual in public classes be objected to, on the ground of its applying to some among them in the way of a religious test, it is respectfully suggested, that already, in most of our Universities—at any rate in one—the business of each class is opened every day by the Professor with prayer. In performing that duty, a recognition of the peculiar principles of Christianity is unavoidable; and since the students are thus indiscriminately called on to join in so solemn an acknowledgment of those principles, it does not appear either as a great innovation, or, on the score of consistency, as objectionable, that the same be brought forward in another form, and become the topics of stated examinations, under the guidance of an authorized manual. If this proposal, however, be still objected to, may not the Sacred Scriptures, in the Latin and Greek versions, be statedly read, and to a certain extent be made the subject of examinations, both critically and historically?—or, should every thing *directly* bearing on the doctrines of Christianity be still excluded from the Literary and Philosophical classes, could any objection be started to the reading and expounding of such a book as Paley's Natural Theology?—While in the Physical class, for example, so much is usually heard of the phenomena of the universe, as little more than proofs of the capabilities of nature, a regular exercise on that book might serve to deepen very seasonably the impression of the existence and superintendence of a First Cause. But surely, in whatever way it is to be accomplished, it is most desirable that the whole course of education at the Scottish Universities should receive something more of a stamp from the National faith.

Supposing no other duty is thought fit to be performed by the Principals, do you think it would be any improvement if the Principals of Universities were to deliver a popular course of lectures upon the evidences of Christianity, not intended merely for students of Divinity, but open to the general students?—It would be a very excellent practice.

University of Edinburgh.

Rev. Dr. W. Muir.

27 November 1826.

Would you require attendance upon such a class from those who intended to take a degree in Arts?—I should see no possible objection to it.

Did you attend any part of your Theological studies in Edinburgh?—One session.

Are you acquainted with the state of the Theological Library in this University?—No, I am not with the present state of it.

Do you remember if, at the time of your attendance here, any dissatisfaction was expressed as to the state of the Library?—No; I have no distinct remembrance of any dissatisfaction expressed about it. We used to have frequent meetings and some discussions as to the Librarians; and the way, if I remember right, of introducing and arranging the books. That took place during the first year of the present Professor's course. But there were no such disputations then, as I have heard by report have arisen since.

What were the principal causes of dissatisfaction at the time?—I do not remember any particular causes of dissatisfaction. The meetings were chiefly with regard to the arrangement of the books.

Had the students experienced any inconvenience in getting books at the Library, or was there a want of a sufficient number of copies, or had there been a purchase of improper books?—No, I have not a distinct recollection of any grounds of dissatisfaction, such as I have heard have occasioned so much discussion since.

Did not the students wish to suggest the books that were to be purchased?—That I believe was afterwards. But I have a very indistinct recollection on the subject.

Have you any further observations to offer upon the subject of your examination?—I really have not any thing further to say. I have had no information to communicate to the Commissioners, nothing but mere *dicta*.

Edinburgh, Monday, 4th December 1826.

The Right Honourable The LORD PRESIDENT in the Chair.

James Pillans, Esq., Professor of Humanity in the University of Edinburgh, called in and examined.

Professor Pillans.

4 December 1826.

Are you Professor of Humanity in this University?—Yes.

Have you seen the questions that were put by this Commission to the Senatus Academicus, and the answers that were returned to them?—I have not yet had time to peruse them: a copy may have been sent to my house; but, having been absent till within two days of the commencement of the College Session, I have not yet seen them.

How many classes have you?—Two; the Junior and Senior, or First and Second.

How many hours do you teach?—The First or Junior Class meets from 11 to 1, five days in the week. It has been the custom, hitherto, for the First Class to meet one hour upon Saturdays, but not till after the 1st of January. I have begun, however, this year, and mean to continue to meet that class an hour every Saturday during the session. The Second or Senior Class meets from 9 to 10 every day, and on Tuesdays and Thursdays from 2 to 3. Saturday is a sort of disposable day, and every Professor makes what use of it he pleases. I devote an hour on Saturdays to meet those of the Senior Class who engage in private study, to examine on the results of that, and explain the difficulties they have met with. I may also mention that I have generally met the advanced class on Monday mornings, at half-past eight, (half an hour before the usual time,) for the purpose of exercising them in the recitation of select passages in Latin and English.

In the Return, the number of students who attended your class for the two years, 1819-20, and 1825-6, is not mentioned, but left blank; can you mention the reason for that?—I went abroad so immediately after the last course, that I have not had time to make it out.

What is the reason why the year 1820 is left blank in the Returns?—That was the last year of my predecessor, Mr. Christison.

At what age do the young gentlemen commonly come to your Junior Class?—About fourteen and a half is the average age of those who come into that class, and fifteen and a half, or perhaps sixteen, is the average of the Senior Class.

Do you consider the age of fourteen and a half to be rather too young for boys to come to your class, freed from all the discipline to which they have been subject previously?—If they were to be so freed, I should say certainly it was; but I think it quite possible, at that period of life, to subject them to a discipline which may, in fact, be as effectual, though without punishment, as any that can be used in a school. I am tempted to mention, as a proof of this, that the Junior Class, at the moment I am speaking, is at work, writing an exercise I prescribed, under the superintendence of a general censor, who will collect the results, and dismiss them without my appearing again. It is a new experiment, which I should not think of repeating but on an occasion like the present. It is one which I am quite sure will succeed.

Then you are not sensible of any want of attention or emulation among the students?—Not the least.

Do you conduct your classes entirely by Examinations?—Entirely by Examinations, with Prelections, as opportunity may occur. It occasionally happens, even in the Junior Class, that a large proportion of the hour is passed in Prelection; that is, in speaking *extempore* upon subjects connected with or suggested by the business in hand.

Have you any separate hour for Lecture?—The two-o'clock hour is generally supposed to be devoted to that purpose. This year I have announced that I shall not give any written lectures until after the Christmas recess, for reasons that I shall be happy to state if the Commission think it worth while to hear them.

Are you now speaking with reference to the second class?—Yes; in the first class I give no formal lectures, except the first day.

471

University of Edinburgh.

Professor Pillans.

4 December 1826.

Are those lectures voluntary and additional, on the part of the Professor, or are they prescribed by regulation?—They are entirely voluntary.

In examining the classes, do you proceed in any regular order, or do you take them indiscriminately, so that no student shall know when he is to be called upon?—I have avoided any order which the students could discover. I find that, if any exact order is followed, the students will detect it, and a motive for diligent preparation will be thus withdrawn.

Then no student can tell whether he is to be examined on any particular day?—He cannot.

You stated that you had announced you should not give any written lectures until after the holidays; will you have the goodness to state your reasons?—The hour of two o'clock is a gratuitous hour on my part; it does not properly form part of the time of the Senior Humanity Class. When I was pupil in that class, under the late Dr. Hill, there was no such hour of meeting. The hour from 11 to 12, five days a-week, was the time appropriated by the constitution of the College for that class. Mr. Dalzel introduced a third class of Greek, in which I believe he gave lectures, and examined five days in the week, at two o'clock. Mr. Dunbar, if I mistake not, (but I speak with no certain information upon the subject,) gave up two of those days; and it was arranged between him and Mr. Christison, that the latter should teach the other two days, namely, Tuesday and Thursday. Mr. Christison had taught these two additional hours for several years before I succeeded to the Humanity Chair, and I continued the practice, though I found some difficulty in removing the impression that attendance at that hour was a work of supererogation. This year I told the class, in an introductory lecture, that I should devote the two-o'clock hour, at least till Christmas, chiefly to examination upon what is known to them by the name of *private studies*, the nature of which it may be necessary to explain. In a class composed of young men, some of whom come from the High School, some from the Academy, and a large proportion from country schools, the stage of progress to which each has arrived is extremely different. Some of those trained in our great seminaries have made great proficiency; while others, their class-fellows, are very different; and, generally speaking, the young men from the country are very indifferent scholars: with great willingness to learn, they have not had good opportunities; and in most cases I have to regret their want of elementary knowledge. To a class thus composed, it is necessary to prescribe such daily lessons as shall suit the average talent and capacity of the pupils; that, on the one hand, there may not be too much to do for those who are willing to learn, but have not been well grounded, and on the other, that there may be some occupation at least for the good scholars. But, in order to turn to good purpose any spare time the latter may have, I made it a practice, both in the High School and in the University, to prescribe private readings in some classic, different from that used in the daily lessons, to those students who had time to spare from their other duties, and were willing to employ it in this way. Every fortnight or three weeks, a written record or journal of these readings is given in, containing an account of the quantity prepared, and a list of the words, clauses, or sentences, of which they are unable to make out the meaning. As soon as these difficulties shall be solved, they profess their readiness to be examined on any part of the chapters prepared. The classic generally prescribed for *private studies*, is Livy. To secure this business being done effectually, as well as to prevent any attempt at imposition, a considerable time is required to explain the difficulties and hear specimens of translation. A single hour on Saturday I found much too short for this purpose, and have accordingly begun this session to dedicate a great proportion of the two o'clock hours on Tuesday and Thursday to this purpose, including in it Examination, conducted by question and answer in Latin, on the events recorded in Livy's History. It is obvious that this examination must bring under review the most difficult passages of the author, and furnish matter for discussion of great utility, both to the private student and to the rest of the class, who are bound to attend at that hour. The attendance on Saturday, which is employed in the same way, is voluntary; and, already, considerably more than half the class have appeared, the number of private students being about one-third of the class. I do not conceive that a long series of written lectures is of much importance to boys at that period of life; and the instruction conveyed in such lectures is better communicated by occasional prelections, as they are suggested by the lessons of each day, when the minds of the students are already imbued with the subject, by preparation of their task, and consequently better fitted to comprehend what is said.

Do you prescribe any Essays on Roman Antiquities?—I examine, at stated times, on prescribed portions of Dr. Adams' Roman Antiquities. The system of written exercises in both classes requires some explanation. Where the pupils are so numerous, amounting, in those two classes, as has occasionally been the case, to more than four hundred, the labour to a Professor, of correcting and characterising each individual exercise, would be very great; and, after all, would not produce improvement to the writer of it, in the least adequate to that labour; for the youth, not venturing to challenge or dispute the marks and amendments of his teacher, is very apt to throw aside the corrected exercise, and think no more about it. To remedy this evil, as much as to relieve myself of part of the labour, I established, soon after the commencement of the session, (as I did in the High School,) a system of Monitors, or Inspectors of Exercises, taking care to select them from among the best scholars in the class. Who these are, is ascertained by making all write an exercise in the class-room, under my own eye. This is generally done the first week of the session. That it may be a test of the different stages of proficiency, the exercise prescribed consists of different parts, beginning with the more easy, such as a sentence from Mair's Introduction, and advancing to the more difficult translation from English into Latin, &c. This first exercise I take into my own hands, mark the errors, and sum them up at the end; so that I am able, in the course of two days, to make out a graduated list of the students, according to the number of errors they

University of Edinburgh

Professor Pillans.

4 December 1826.

have committed, beginning with such as are quite faultless, and proceeding to those whose exercises contain most blunders. The impossibility of knowing what is to be presented, and the perfect silence that prevails while the writing goes on, make this exercise a tolerably sure criterion of the progress the pupils have hitherto made. By this means, coupled with the examinations from day to day, I am enabled, very early in the session, to select a sufficient number, to whom I intrust the charge of correcting and characterising the exercises of the rest. Their own are shown up to *me* a day earlier than those of the class are required; that is, on the Tuesday morning, the rest being demanded on the Wednesday. I am thus enabled, by carefully noting the errata of the inspectors' exercises, and by prelecting on the prevailing errors they have fallen into, to give them all the information necessary to secure from them a tolerably accurate judgment of the performances of their fellow students. The prelection I have mentioned comprehends a full discussion of all those offences against the rules of Latin syntax and grammar, and against the purity and propriety of Latin or English diction, which the general class are still more liable to commit than the inspectors. These errors thus become the text from which lectures are delivered, in the course of the weekly exercises, upon all that is difficult, peculiar, and idiomatic in the Latin language: and it appears to me that information conveyed in this way is much more interesting and impressive than if it were given in a series of formal written lectures; and for this reason, that, being grounded on the exercise which the students have just written, the minds of all are fresh from the consideration of the subject. For example, suppose it has been required to turn a passage of English into Latin, the ink of their version is scarcely dry when the various inelegancies and faults in concord and government, into which they have more or less fallen, are pointed out and corrected. Thus the pupil is sure to comprehend his teacher, and follow all he says with interest, because his mind has been so recently occupied with the same subject. I may say, from my own experience, that the very countenances and eyes of the class will satisfy any one that, during such discussions, there is none of that languor or inattention that often occurs in the delivery of a formal lecture; but it is seen, from the eagerness with which they listen to what is passing, and the significant looks and smiles they exchange with one another, that they have got information which they did not possess before, and that they plume themselves upon having been right when others were wrong. After this prelection, the inspectors' own exercises are returned, and they become to each a standard by which to examine the ten or eleven exercises which he has to correct. These he brings next morning, along with a slip of paper containing the names of those whose exercises he has inspected, arranged in the order of merit, and the number of errors he has marked in each exercise. These slips of paper, or *reports*, are handed to me, while the exercises are given back, with the faults pointed out and summed up, but not corrected. He now knows only what is wrong, and is enjoined, with the assistance of the observation he heard in the class, his own reflection and reconsideration, or it may be, as a last resource, communicating with his inspector to write the correct expression above the faulty, and to collect and present in one view, at the end of the version, a list of *errata*, in column, as is done in a printed book. In this amended form he is bound to bring it for a second inspection the next morning; and to fail in doing so is reckoned a graver offence, and subjected to as severe a forfeit or penalty, as not to have shown it up at first. It is too common among teachers to think that the business of a written exercise is concluded when it is shown up, corrected by him, and returned to the pupil. I conceive that, to compel the writer to reconsider his performance, and to rectify what is wrong, is more important than the first writing, as the latter, without the former, may only serve to confirm him in error. From the *reports* I read out, next day, a few names in each bench, who are to return their corrected exercises to me; the rest are inspected in the class-room, as the inspectors have now only to see the list of errata, and ascertain if all the mistakes be rectified. These exercises, thus returned, are expected to be carefully preserved, and presented in a regular series, sewed or bound together, in order to secure a good certificate. From the various processes a written exercise is thus subjected to, I find it impossible to overtake more than one regular exercise in the week. Exercises of a higher kind, such as Latin verses, are prescribed from time to time, generally once a-month; but the execution of these is voluntary.

When you use the expression Penalty, or Forfeit, will you have the goodness to explain what you mean by that?—I found the practice established, of exacting small fines for class offences, such as being late, or absent without apology, wanting an exercise, &c.; and I have not discontinued it. They are collected by the general censor, and thrown into the fund allotted for purchasing prizes. Before I was appointed to the Chair of Humanity, I had a prejudice against the system of fines, but I find it less objectionable in practice than in theory. No fine, however, is imposed for errors, however numerous, provided the exercise be carefully written. I know too little of their previous history, to be able to ascertain whether their deficiency arises from their inattention at school, or the imperfect instruction they have had.

Is there any system of Prizes adopted in your class?—Yes, the Town-council allows me £10 annually, to be laid out in Prizes.

Is £10 given to each class?—No, £10 in all for both classes. It has always been the practice to expend this sum in rewarding the best of certain Essays, Poems, and written Exercises, some in Latin, some in English, on subjects prescribed, for the preparation and composition of which a considerable time is allowed. They are generally given out in the beginning of January, to be put into the hands of the Professor on or before the middle of March. The practical objection to this arrangement is the difficulty the Professor finds in ascertaining that no undue assistance has been had recourse to. I have taken various precautions against this abuse; and though I do not despair of removing it entirely, I do not feel quite satisfied that I have as yet fully succeeded. The most unequivocal test of talent is to have

the exercise done in the class-room, under the instruction of the Professor himself, who can assure himself that there is no assistance but what is legitimate, and that all are writing in, as nearly as possible, the same circumstances.

With regard to the weekly Exercises, have you any check upon the Inspectors, such as may, upon the whole, be considered as ensuring the faithful discharge of their duty?—Yes, I have this check; they give me a return, in which the names of the students, whose exercises they have examined, are put down in a graduated list, beginning with the name of him whose exercise is the best, and concluding with him whose exercise is the worst. The number of errors attached to each, and the general style in which the report is got up, furnish tolerable indications of the inspector's having performed the task well or ill. But I am also in the practice of calling, from these *reports*, one or two students, who are to show their corrected exercises to me; and this practice, among other advantages, operates as a check on the inspectors, who are aware that one or more, they know not which, of those exercises they have examined and marked, will be subjected also to my inspection, and any omissions or negligence of theirs exposed publicly in the class.

Do you never find that the inspectors are apt to mark, as errors, any deviations from the modes of expression which have been approved in their own exercises?—I am glad that question is put to me, as it enables me to state the result of my own experience with regard to the correction of exercises. I am far from meaning to say the correction of the inspectors is in all cases absolutely perfect; but I hold, that the system of correcting by inspectors is more effectual for the improvement of the writer, than if the master corrected them himself; and for this reason, that a boy looks up to the master as having absolute knowledge—as one whose *ipse dixit* is quite conclusive. If the master himself has corrected the exercise, it is a tribunal without appeal, and the student does not exercise his judgment at all; but when he receives an exercise corrected by a fellow-student, whose superior scholarship, if he admits it at all, he considers as raising him only a step or two above himself, he is anxious to catch him tripping, and is eager to make appeals against his marking. He examines the exercise of course with a mind intent on discovering errors. His great object is to detect some mistake of his inspector, either in omitting to mark an error, or marking some as such that may be found to be right upon subsequent explanation. The purpose of these exercises I conceive to be answered when they give rise to much observation, research, and reflection on the part of the boy. He will apply to his dictionary, and all other sources of information within his reach, to detect his inspector in a blunder; whereas, if the master or professor himself had either corrected the errors, or had omitted to correct some of them, (and a master is, perhaps, more apt to pass by errors than a clever inspector,) it would have remained equally, in both cases, unnoticed by the writer. Thus, though the exercises may be less perfectly corrected on this plan, yet it accomplishes the great object of all exercises, which is to excite talent, to encourage a habit of accurate thinking, and to occupy time usefully; and this in a greater degree than is likely to be done by the most careful correction of the teacher himself. It is possible that exercises may be shown, by those who are inclined to be critical, as specimens of what is done in the High School or in the College, in which flagrant errors are not marked, or words noted as wrong, which are right enough. The door is always open for appeal, and I have not unfrequently occasion to reverse the sentence of the inspector. But I am aware that, from laziness, or ignorance, or want of time, such appeals are not always made when there is ground for them. Still a few individual instances of this kind do not militate against the general principle, that more improvement is gained by setting the scholars to correct each other's exercises (it being understood that the inspectors have their exercises corrected by the Professor himself, and be thus supplied with a standard by which to judge of others), than if he were to employ every hour of his time in correcting exercises.

Do you conceive the same advantage likely to attend the practice of correcting exercises by means of monitors or inspectors in the junior classes of a grammar-school, where the boys are not likely to be able to exercise the same judgment?—I cannot speak with certainty of any class lower than the Rector's class in the High School of Edinburgh, where the pupils are in their fifth or sixth year of classical study. In the first or lowest class, I should think it impossible to adopt that plan; for few or no exercises are written there. Before the fourth class it would scarcely be advisable to attempt that, and I am not quite sure that it would be practicable even there; but I know, from my own experience, that it may be an instrument of great good in the Rector's class.

Are these weekly exercises imperative upon all the students?—They are imperative upon all the students, unless some satisfactory explanation is given by the pupil himself, upon entering, which secures exemption. There are generally a few attending the senior class, considerably above the average age, who, with every disposition to do all the business prescribed, cannot, from their time not being their own, overtake the whole of the exercises.

Do you take any similar excuse from young boys?—No, never. I take a written apology, under the hand of a parent or guardian, or some responsible person, for the want of a particular exercise.

Then you take no excuse from a boy for not performing the duty of writing exercises during the session?—No, none; unless a parent says there is a particular reason, such as, that a boy is going out to India, and for that purpose has to attend to other studies. I conform to the will of a parent or guardian, but never from the mere wish or reason of the boy himself.

Will you mention the character of the weekly exercises generally, beginning with the first class, and then in the second?—In the junior class, they consist generally of translations from Latin into English; and if the passage prescribed be from a poet, the student who has any turn for versifying, is encouraged to attempt a poetical version. Translations from Latin into

University of Edinburgh.

Professor Pillans.

4 December 1826.

English are also prescribed. A passage is taken, either from the English sentences at the end of the rules in Mair's Introduction, or from an account of the early life of Alexander prefixed to some extracts from Quintus Curtius, printed for the use of the younger class. I very often prescribe it as an exercise, to give the substance of any short discussion, dissertation, or prelection, they may have heard, and which has been suggested in the class, coming in the course of the daily reading. An example occurs to me at this moment: The word *obnubit,* occurring in the Virgil lesson, gives rise to questions on the composition of that verb, the original meaning of the simple word *nubo;* how it came to signify to be married; why it is applied only to women; what are the nouns derived from it, both in its primitive and derivative signification; how the English verb '*marry*' is expressed in Latin, when applied to a husband, to a father, and to a priest, &c. &c. All this leads into a good deal of discussion and illustration; and it is not till it is finished, that they are apprised that this is to be the subject of the next exercise. The chance of any such discussion being so prescribed, is no small inducement to be always attentive.

Are such exercises imperative when prescribed?—They are. It does sometimes happen that a boy is so little accustomed to follow reasoning, or to express his thoughts in English, that, upon declaring his incapacity, he is allowed to substitute another exercise. The remarks I make on these English Dissertations are directed in part to the propriety of their own English diction, which I hold to be quite within the limits of my province as Professor "Literarum Humaniorum."

Are these all the subjects of exercise in the Junior Class?—Besides these, exercises are also frequently prescribed in the elements of Latin versification; and soon after the 1st January, subjects are given out for longer and more laboured exercises, comprehending discussions on grammar, antiquities, &c. To the best of these attempts, prizes are assigned.

Will you have the goodness to mention the Exercises you prescribe in the Senior Class?—In the senior class, they are very much of the same general description, but of more difficult execution. In both classes, after giving the explanations of the version of the inspector, I sometimes prescribe, as the subject of the next exercise, a statement and discussion of the prevailing errors in the last. This not only accustoms to English composition, but secures attention to the prelection on the inspectors' exercises, and confirms the information given; it being required not merely to enumerate the chief errors committed, but to rectify them, and give a reason for the change. This, as well as every other exercise, except that written for a prize, is expected to be preserved, in its corrected form, till the close of the session, and then to be stitched together, and shown to me as a voucher, which may enable me to fill up part of the certificate.

Do you prescribe Exercises in Latin, which are not translations from English to Latin, but original composition, either in prose or verse?—I do, both in prose and verse; but such compositions are not imperative. It would be vain to require copies of Latin verse, or even original Latin prose, from all the pupils, even of the senior class. A considerable number enter the senior class but imperfectly acquainted even with the elements of prosody, having not only never writen what is called *nonsense* verses, but not even learned to scan by rule. If they have been taught to scan at all, it is only by the ear.

Do you get a considerable number of compositions in original Latin prose?—Latin prose, except in the way of translation, I do not often prescribe. When the subject is proposed for Latin verses, the choice is left to the student to write on it in prose; but he seldom avails himself of the permission, although he is considered as entitled, *cæteris paribus,* to equal praise. In the competition for the Town Prizes, a subject is also given for a Latin prose composition; and of such attempts I receive perhaps fifteen or twenty.

Do you get a considerable number of attempts at composition in Latin verse?—Yes. I have had as many as twenty copies of verses shown up by the senior class. In the junior I scarcely ever attempt more than *nonsense* verses, and a few before Christmas; for there it is quite necessary to commence with the very elements of versification.

Are the original prose and verse exercises corrected in the same way as the others?—No; they are corrected only by myself. They never amount to so great a number as not to be quite easily overtaken. They are always shown up on Friday. I have to give a graduated list of merit on Monday; and they all know the characters assigned to them.

You have stated you did not exact many Exercises in Latin composition, except in translation, will you have the goodness to mention the reason?—Because I find that composition in Latin prose is a rarer and more difficult attainment than composition in Latin verse. If a boy has undergone due preparation, by being drilled in writing *nonsense* and *sense* verses, he may be fairly allowed, with some prospect of success, to try his hand in making verse out of his nonsense. It is not so easy to give precise rules for the composition of Latin prose. The very shackles of verse appear to assist the youth in getting on; and they can imitate Ovid much easier than Livy; and a boy, *cæteris paribus,* of equal talent, will, with the same drilling in each, excel sooner in Latin verse than Latin prose. On that account, I do not think in general that an exercise in original prose composition would be very advisable, at least as a regular part of the business.

Do you consider it a higher test altogether of a person's knowledge of the Latin language, and of his talent generally, to write a very good prose composition, than one in verse?—Certainly.

Have you ever been in the habit, after the English compositions have been given in to you, to direct the boys to turn them into Latin?—I have occasionally, but very rarely.

Have you had experience of that system elsewhere?—No.

Is it not frequently practised in the English schools?—As a regular part of the English school system, I am not aware of it. I do not think it is done at Eton or at Westminster, and of the other schools I know very little. I did it occasionally in the High School, but

475

University of Edinburgh.

Professor Pillans.

4 December 1826.

never made it a part of the regular business of the class. The exercises are almost as various as the subjects that come before us, in commenting on the different classics we read.

Is the time within which exercises are to be performed, limited and prescribed?—The regulation this session, which I have no reason to think I shall speedily alter, is this: The subject for exercise is given out on Thursday, at the two o'clock hour to the Senior, and on Friday to the Junior; the exercise to be shown up by the inspectors on Tuesday, and by the class in general on Wednesday..

You mentioned that there was a certain number who were found to be more advanced, and who got on by private studies, of which they showed up a record at different times; but, in conducting your ordinary examinations, do you direct yourself chiefly to those who do not perform those exercises, or is the examination quite indiscriminate?—Quite indiscriminate. I do not omit the private students; because, if I found that any of them neglected to prepare the ordinary business, that he might show up a greater amount of *private studies*, I should think it my duty to tell him he had no right to prepare private studies, and neglect the other business of the class. It is well known how much is gained with youth, by representing as a privilege, what might otherwise be considered as a task. It is always held out as a privilege to prepare private studies; and this excites in many an ambition to join that class, who would not otherwise think of it.

How often, upon the whole, do you suppose each young man is called up in the junior class?—I should say, as far as I can judge, that he is called to say something every second day of the junior students. At the same time, I cannot speak on this point positively, for I have never followed any regular order in calling the students to say, because I find it much more advantageous to leave that in such uncertainty that no student shall foresee when he is to be called up, and when not.

Do you put any marks against their names, so as to be able to state how often they have been called up?—A Professor, in either the Greek or Latin Chair, has considerable difficulties to contend with in the examination of his class, arising from the small allowance of time, and the great number of pupils. On the one hand, if he, with the notion of doing justice to every individual, call the names in some regular order of succession, so that no student shall be able to say he has been called up seldomer than another, they detect the order the Professor follows; and, if disposed to be idle, calculate shrewdly enough how long they are safe in neglecting to prepare their lessons. This view of the matter has always appeared to me conclusive against the regular method; which, under the specious pretext of acting fairly by all, does, in fact, do justice to none. On the other hand, when the Professor examines, without fettering himself by any rule of call, though he keep all on the alert, yet he is apt to overlook some, and call those more frequently who have made themselves remarkable either for inattention and idleness, or for able and ready answers. Finding it difficult, in the order of teaching, and indeed a loss of time, when every moment is precious, to mark in a book the character of every appearance made, I have devolved this duty on my General Censor, and I am confident it will be better executed than when I attempted it myself. There is another reason why some may say they are called up to say less frequently than others. When a youth is under examination, and a question is put which he cannot answer, all on the same form who know it are called on to rise. If the question be a difficult one, and no student stand up in that form, I open it to a wider and wider competition, till at last it embrace the whole class; all then rise in their places who have an answer to give. Out of these I name one to speak out his answer, and all who had the same ready to give, sit down along with him. If this answer be wrong, another of those standing is called upon for his; and if that be right, all sit down. The same process takes places when a student, called on to construe and translate a sentence, fails in doing so; and nearly the same when, as is often done, I call those to rise who have any difficulties to state before the lesson begins, in the passage given out for preparation the preceding day. In this way, it is obvious that the best scholars will oftenest be heard in the class, for the dull or ignorant seldom or never do rise upon such occasions; and there are questions that are occurring continually. Such modes of putting questions and receiving answers must, it is clear, occupy a great part of the time devoted to examination. It should be considered also, that in an advanced Humanity class, it is but a limited portion of our limited time, that can or ought to be given to question and answer; and that, unless such a class is to degenerate into an ordinary school, much of the allotted hours should be occupied by the Professor in illustration and prelection, and by the student in listening. It may be worth while to mention under this head, that as a means, among others, of distinguishing merit, the General Censor is instructed to put upon record the names of those, if they do not exceed the number of three, who give full and satisfactory answers to questions which puzzled the rest of the class.

You have alluded to the arrangement of the students in your class; are they classified on any principle, or merely so as to enable the censors to perform their duty?—I have sometimes thought of classifying them according to proficiency; but the different sets run into each other by such imperceptible gradations, that I have never yet been able to arrange a plan which I thought likely to ensure a beneficial result. It is not like a Greek class, where you may easily class those who have had no Greek, and those who have a little. But even in my junior class, which is, properly speaking, the sequence of five or six years of previous study of Latin, such classification has not yet appeared to me to be required.

Do you find boys come to the second class, who, in your opinion, would be better employed in the first?—A great number; and their names I could mention after the first week of the session.

Are there any particular reasons to which you would ascribe that, in any degree?—Yes, there are several reasons for the preference given to the senior class. One is, the ambition of

University of Edinburgh.

Professor Pillans.

4 December 1826.

the youth themselves to be in the higher class, and the influence they have with their parents to send them thither, without any satisfactory inquiry—without even asking me to give an opinion on the subject. If a parent does so, which sometimes happens, I examine the boy, and express my opinion as to the class he should enter; but I do not consider myself as armed with any authority to say to a boy, "You are to enter the first, and not the second class." Another reason is, the interference of the senior Greek hour with the junior Latin. There are many that would willingly take these two together, who either forego the senior Greek to enter the junior Latin, or *vice versâ*.

May there not be boys coming from the High School or the Academy, quite fit for the Second Greek, who yet ought to be put in the First Latin Class?—Certainly; in particular, when they have been good Greek scholars, and not very eminent in Latin, as happens not unfrequently.

Does the attendance upon your classes interfere with the first Greek Class, or does that interfere with either of your classes?—No; the first Greek meets from ten to eleven, and from one to two—both vacant hours with me.

What different arrangement would you propose to obviate that difficulty?—I am at a loss to say; *that* would depend upon the possibility of arranging the hours, to do which is a practical difficulty of no small amount; for no sooner is it proposed to change an hour, or take a new one, than half a dozen Professors put a *veto* upon such alteration or innovation, as interfering with them.

Laying aside the opposition of other Professors, and supposing the regulation capable of being carried into effect by independent authority, what arrangement would you be inclined to propose as to the hours?—I am not prepared to answer that question. It would require one to have under one's eye a scheme of the whole lectures, and the hours allotted to each. I may mention that my predecessor, Mr. Christison, used to teach the junior class from eight to nine in the morning, and from twelve to one; but when the hours were so arranged, the Greek Professor taught his senior Greek at eight in the morning, so that the hour of that class has always interfered with the junior Humanity. I was induced to change these separate hours, and to consolidate them into one unbroken space, from eleven to one o'clock, because it appeared to me that boys fresh from school would get through much more work, and to better purpose, in being kept two hours together. I should be unwilling to give up the two consecutive hours of the junior class; but if any arrangement could be found to prevent the junior Greek class from interfering with the hours of the Humanity, it would doubtless be a great improvement to both.

Do you not find many of the students very inadequately prepared even for the first class?—I do.

Are those students chiefly from the country?—Chiefly from the country. There is always a certain number from country schools, whom it is difficult to make any thing of by the present discipline.

Do you not think that, considering the character and objects of your class, it would be of importance for the interests of the lads themselves, that you should have the power to return to the first class, students who wished to enter the second, when, in your opinion, they were found unable to carry on the business of the latter class efficiently and usefully?—I do, certainly.

Supposing the students were only to attend one of your classes, would it not be a greater advantage to themselves, in the case now supposed, that they should attend the junior than the senior, when they were imperfectly prepared for the latter class?—No doubt of it; both because the instruction is better adapted to their capacities, and because they would have nearly double the time.

So that if a person wished merely, by attending one Humanity class, to qualify himself, say for entering as a Writer to the Signet, for which attendance at one class is requisite, it would be no particular hardship if the Professor were armed with that authority?—No, except in this respect, that the master in whose office he was, if he were in an office already, would object to his being away from eleven to one.

But would it not be an advantage to the boys themselves?—Yes, unquestionably; a decided advantage.

Would it not be a great difficulty, that if they had already entered the second Latin and the second Greek, they could not come back to the first Latin without giving up the second Greek?—Yes; but I supposed an arrangement to have been made to prevent interference.

Would it not be practicable, however, in the first week of your two classes, for you to select and arrange the students, so as to be able to say whether they ought to go to the junior or senior class?—Quite easy; but unless some arrangement of hours were previously made, many of those whom I should be disposed to recommend to the junior class would be found to have already entered the senior Greek class, which meets at the same hour.

Then the object, in regard to the arrangement of hours, which it is desirable to accomplish, is, that the senior Greek class should not interfere with the junior Latin?—Certainly; the second Greek and first Latin classes should be considered as parallel in point of previous proficiency. In the first arrangement of the hours, as they have always been, the idea seems to have prevailed that the first Latin and the first Greek classes correspond, which is absurd, as every body knows that the first Greek class begins with the alphabet, whereas the first Latin succeeds four, five, and often six years previous study of Latin.

On the other hand, do not the greater proportion of those attending the first Greek attend also the first Latin?—Yes.

What is the method you adopt to enforce and secure regular attendance?—I employ for this purpose *censors* or *inspectors*. It is better perhaps to explain what my system in this

477

respect is now, and will be, I think, in future, without mentioning in what points it differs from that of the last or preceding years.

Have you made any material changes?—Not in *principle;* but in the details I have united, for example, the two offices of Inspector and Censor. Previous to this year, I used to have censors whose business was merely to collect the names of those who were absent and late, while the inspectors had nothing to do but with the exercises. It simplifies the business to make the inspectors do both duties. There are twelve benches in the class-room, each of which contains twenty of the senior, and twenty-two of the junior class. They are divided by a plank running up the centre into two equal parts, and at the outer extremity of each of which sits an inspector, whose business *every day* is to see that the number in his side of the form, whether north or south, is complete; and if not, to return the names of the absent and late, and, on *the day appointed,* to collect the exercises of the ten or eleven he presides over, and to mark the *non dantes.* The general censor takes up all the *reports,* and makes a digest of the whole in his book. From this he states next morning the names of the absent the day before, of all who have incurred a fine, or require an apology; it being understood that they remain after the class is dismissed to pay the fine, or give in the apology, which must always be a written one, and marked by me with the word *valid,* before the censor will admit it.

What do you do if an inspector is absent or late?—The general censor informs me of the fact, and a substitute is appointed. After the first month, the *last* inspector takes the duty of the absent one: for it may be worth while to mention, that new inspectors are appointed every month, that as many as possible may reap the honour and improvement which this office holds out.

Do you consider that the duty is in general faithfully performed by the censors?—Quite faithfully; so far as I have had experience, they perform it faithfully. My health was not good last year, and it is possible some errors and imperfections may have crept in, and have been quoted against the general system of the class. Of that system I do not look upon last session as a fair specimen. To carry on vigorously such a system, it requires a man to be in perfect possession of his bodily health.

Do you ever call a Catalogue?—Very rarely. If I have doubts myself as to the way in which the inspectors discharge their duty, I do occasionally, perhaps once a month or so, call a catalogue, and oftener if I see any necessity for it; but to call it daily, or even weekly, I should consider, under the regulations adopted in my classes, as a mere waste of time. It was an object with me from the beginning to arrange the business in such a way as to render it unnecessary to call a daily catalogue, which consumes, in a class so numerous as mine, about ten minutes of the hour; and that amount, subtracted from every hour throughout the session, is a very heavy deduction from the time allotted for instruction, where the entire sum is so small. I begin business three minutes after the bell rings. Were a roll called every day I could not commence the lecture sooner than thirteen minutes after the hour; and after all, I could not be nearly so sure of procuring the names of the absentees as by the plan I adopt; for it is possible that one boy may answer for another.

You mentioned, in a previous part of your examination, that you gave certificates; are those certificates merely of attendance, or of the proficiency of the students?—They are certificates of their proficiency.

Do they embrace both objects?—They embrace three objects: first, regularity of attendance; secondly, proficiency; and, thirdly, propriety of behaviour. I have this session adopted the method of engraving the formula of a certificate on the back of the class ticket, that the student may have his mind fully impressed with the points of conduct on which a judgment is to be recorded by me when the blanks are filled up.

As you keep no record of the number of times a boy is called up, do you judge of his proficiency by your recollection of his exercises?—By the notes I have taken of his appearances on examination, which this session will extend to the exact number of times he has been called up, and by the inspection of his exercises, both at the time they are written, and of the whole at the close of the session; for the students of both classes are enjoined from the first to preserve every exercise, and have them stitched into a volume, to be shown to me before the blanks of the certificate are filled up.

Do you give certificates at an interval of time after the students leave you, or only at the end of a session?—Generally at the close of the session; but either I or the student may be called suddenly from Edinburgh, so as to prevent the certificates being given at the moment.

In general, do you give it only at the time the student leaves?—My intention this year is to call in the tickets in March, and fill up the blank in the formulæ, leisurely and deliberately, according as I make up my mind on the merit of each individual.

Will one advantage of this new form of ticket be, that, if you only feel yourself at liberty to attest two of the recommendations of the student, it will appear on the ticket that he was deficient in the third?—I shall either not fill up the corresponding blank at all, or in so qualified a way as to lead those who see it to judge, on a comparison with others, whether he has acquitted himself well or not. I have occasionally, but very rarely, marked, by a positive expression, my disapprobation. With regard to proficiency, for example, you have a young man who comes from the country in narrow circumstances, whose opportunities of instruction have been limited, but who has made the most of them. With all the will to do well, he is still very deficient, and makes but an indifferent figure in the class. It would be severe justice to such a youth to fill up the blank as to proficiency in such a way as might affix a stigma to his character as a scholar.

But in the form of the ticket you have now adopted, the different qualifications, regularity of attendance, propriety of conduct, and proficiency, will be printed, so that if you are not at

University of Edinburgh.

Professor Pillans.

4 December 1826.

liberty to fill up the whole, it will appear upon the ticket that the student was deficient in some one of those three particulars?—Certainly; the whole business of certificates, as now arranged, was explained to my present class the first day of the session in the following terms:—

Extract from Introductory Lecture to Senior Class, November 1826.

"Having alluded to the subject of certificates, I may take this opportunity of mentioning, that the *formula* on the back of your ticket, the blanks of which are to be filled up at the close of our labours in such terms as the behaviour of each individual shall justify, contains three points which I strongly recommend to your attention. 1. The first regards regularity of attendance, to which the highest testimony that can be given will be that the bearer 'has *never* been *absent* or *late*,' either at the hour of nine or of two o'clock. When you reflect on the very acceptable and satisfactory information which these few words will convey to your relatives and friends as to the regularity of your daily habits during the whole of a winter session, I trust that every student, even if it were only for the pleasure it will give to those that are dearest to him, will feel ambitious of carrying with him such a testimonial. Sickness, or some unavoidable accident, may no doubt break the charm of uninterrupted regularity; but such a circumstance, well attested, will not of course forfeit the student's claim to the praise of regular attendance.

"2d. The second point regards propriety of behaviour in the class-room, both in assembling and during the business of *the class*. The rule on this subject is so simple and obvious, that it can scarcely fail at once to secure the approbation and observance of every well-disposed mind. It is this, that you consider the place you are in as sacred to instructive science; as a place where the ear and the eye are to be incessantly active in taking in knowledge, but where the hands and feet are to be restrained from noise, idleness, and mischief, and the tongue from uttering anything which is not addressed to all.

"The third and last point mentioned on your ticket, and as to which every student must be desirous to carry with him an honourable certificate, is that which regards proficiency in the studies you are entering upon. To this object, indeed, the two former are subordinate and subsidiary. The reality and extent of your proficiency will be proved by the successive improvement you exhibit,—1. In construing the lessons, and bearing examination on the questions in Syntax, Antiquities, Geography, and other subjects suggested by the passage before us; and, 2. In the correctness and intelligence with which you write the weekly and other exercises which are to form part of the regular business. The stages of progress from which you are now starting, I am aware, are almost as various as the individuals composing the class; but with the causes of this diversity, as far at least as your certificates are concerned, I consider myself as having nothing to do: the good will you show, and the exertions you make, from the time of your entering the class till you leave it, and the difference between your knowledge of Latin at the two different periods,—these are the elements out of which I shall endeavour to form and record a deliberate impartial judgment. The blank space reserved below the formula is intended for an additional attestation in favour of those who shall establish a just claim to such distinction by very marked and extraordinary efforts."

Were the certificates formerly separate?—Yes; I had the formula lithographed, and the blanks were filled up by me.

Could a person, who was not aware of your system formerly, if he saw a certificate of regularity of attendance, know that you were ever in the habit of certifying more?—I always certified the degree of proficiency and good conduct along with that of regular attendance.

Will one advantage of this method be, that the student will know that the only certificate he is to receive will show in what respects he has been deficient, should you not feel at liberty to attest his qualifications in all the three particulars?—When a student takes out his ticket, he finds on the back of it what are the points he is to attend to.

Are you in the habit of keeping any memorandum or register of the particulars certified, so that if a certificate were to be lost, it could be supplied in the same terms as the original?—No, I have not hitherto kept any register of each individual case for the reason I have mentioned, that I issued these certificates rather in a hurried way at the close of the session, when every student was anxious to get away, and wished to have his certificate immediately. If he applied to me afterwards, I gave him his certificate from general recollection, or from reference to my own notes.

Do you not think it would be desirable to keep such a register, so that there might be perfect consistency in the event of the loss of a certificate?—Certainly, it would be desirable to keep a copy.

Would it not be easy to have the names arranged in alphabetical order, in both classes, so as to insert, opposite each name, the particular term you chose to use, either "regular in attendance," or "proficient," or "unexceptionable in conduct," or whatever other epithet you chose to affix to it?—It might be done certainly. Sometimes a certificate is torn, and the student wishes to have it renewed: some never receive a certificate at the time, and come back to me long after to fill one up, which I do as well as I can from the recollection or trial.

Might there not be cases of hardship where students, some years after their attendance at your class, wishing to apply for a situation in a school, or some other office requiring a learned education, could not get a certificate granted, and by that means might lose the appointment?—In a case of that kind I am in the habit of giving a general certificate, not one of the common formulæ, but a general certificate of the impression and recollection I have of the youth; or I examine him upon the spot, and give him a certificate founded upon that examination.

Notwithstanding the number of your second class appears generally to exceed the number attending the first very considerably, have you had occasion to observe that any considerable proportion of the young men attending other classes at the College have not come to your second class, though, in your opinion, they would have been the better for it?—I have not taken any particular note of that.

Do you think that the greater proportion of the students of the first class come to the second,

479

University of Edinburgh.

Professor Pillans.

4 December 1826.

if they remain at this University?—I have not made any estimate of the proportion; but I should suppose about two-thirds at least attend the second after the first.

Has any considerable proportion of the number mentioned as having attended the second class consisted of persons attending the third year?—Yes, a considerable number: this year, for example, about 24 have already entered a third year; they pay nothing but the dues.

From what classes or situations, generally speaking, do these young men come who are attending the senior class without having attended the first, and of which the number appears to be so great?—They generally come from the High School.

Do they not commonly come to your first class?—Many do; but the greater proportion of those who have entered the second class, without having been in the first, have consisted of High School boys.

Do you find those pupils in general sufficiently prepared for your second class?—Very often not.

Will you have the goodness to inform the Commissioners of the books you are in the habit of reading, so as to show what is done in each class, mentioning first the grammar you have occasion to make use of, and then such other books of philology as are used?—In the junior class the grammar I refer to is Dr. Adam's, because I find it is that which the greater proportion of students have been taught by; but I seldom give regular lessons out of the grammar, for that would be pitching the instruction too low for a class of Humanity. I have occasionally given lessons in the grammar, particularly upon the irregular verbs, when I found, for instance, a great proportion of the junior class deficient in such elementary knowledge. I generally also make the other students learn a few of the rules for Latin prosody at the end of the grammar, who have not been taught them before. But the grammar is used for reference, rather than as a regular class-book. To use it in that way would be to compromise the dignity of a University class. Many who enter the class require it certainly; but such as do I speak to alone, and point out the way of remedying their deficiency by private study, and to come to me for explanation when they meet with difficulties. Such elementary books, therefore, as the Grammar and Mair's Introduction, are used chiefly to bring up the knowledge of those who, from imperfect teaching, are greatly behind. Who these are is easily ascertained by an exercise from Mair's Introduction, written in the class. And as the number is always very great, I employ some time at the beginning of the session in examining on Mair; and by the specimens these students see in the class, and the instruction given in turning the sentences, they are put in the way of going through a course of this little work in private study, and of thus redeeming, as far as possible, the disadvantages of their early education. The results of these private readings and exercises are *shown up* at intervals, and the more advanced scholars are employed in solving the difficulties and rectifying the blunders of the rest. And this, which is partly conducted in the open class, gives rise to discussions and observations which, though originating in what may be thought quite elementary, lead into a consideration of the nicest and most curious points in the language. These private studies, which are shown up and examined upon once a fortnight, consist, 1. of a careful perusal of all the rules and notes; 2. a *preparation* of all the sentences under each rule, with the marking and registering of the points of difficulty; and, 3. the *writing out* of *one* sentence under each rule. Some finish their revise of Mair in this way, from beginning to end, in a very short time, and are immediately advanced to read, *as their private studies, Cæsar or Quintus Curtius*—books which form no part of the daily and ordinary business of the class. With a larger proportion of the class I find it necessary to continue these private studies longer, and with some almost to the end of the session.

Are there no keys to that book to which the students may have resort?—Yes, but there are means of detecting that, which I have more than once put in practice, and always with complete success. Fortunately it happens that the key in general use, and the only one I have seen, is full of the most egregious blunders; so that one has only to prescribe a sentence in which some of the blunders occur, and as error is infinite, and truth but one, I have a strong presumption, amounting almost to a certainty, that all whose exercises agree in committing the error have had unlawful aid. The exposure that follows is a tolerable security against recurring to this treacherous auxiliary. Besides, the cross-questioning that takes place, *coram condiscipulis*, renders all such assistance unavailing, as the maker of the sentence is constantly called upon to state the rule or reason why he makes it one way rather than another; and preparation, founded on anything else but thorough comprehension of the syntax, tends only to make him ridiculous. The student called up makes his sentences of Mair without interruption, whatever errors he may commit, and others are then called on to name and rectify, in regular succession, the faults committed, adding always the reason why he condemns the one way of turning the period, and substitutes the other.

Are not many passages in Mair in very indifferent Latin?—They are; but with boys in that stage of progress great elegance of Latinity is not a *sine quâ non* in such exercises; it is subsequently. The extracts are many of them from Justin, and other indifferent enough authors; but, for the purpose I have in view, Mair is a very good book.

Will you have the goodness to state what other books you use?—For the daily business of the class, I generally commence with a book of the Æneid, selecting one which few or none of the students have read before, and after some time take up also a book of Livy. Livy is a little too difficult, perhaps, for a large proportion of the class at starting, and, accordingly, this year I do not mean to commence it until after the Christmas recess, reading, in the meantime, of poets, Virgil, and of prose authors, a little of Quintus Curtius, as a preparation for the taking up of that author as private studies. I have adopted this book as a subsidiary part of the business, not because it is in the very first style of pure and elegant Latinity, but because the subject is extremely interesting to young people; and that is an important point

University of Edinburgh.

Professor Pillans.

4 December 1826.

when the readings, as in this case, are altogether voluntary; for after Mair is finished, those only are invited to take up private readings who feel they are able for it, and have time to spare from their other studies.

Do you always take the same book of the Æneid?—Never, for two successive sessions; nor of Livy.

Is any other book read in the first class?—Some extracts from the *Fasti* and *Tristia* of Ovid, chiefly with the view of teaching the structure of elegiac stanza, and exercising the students in prosody, and in the elementary parts of Latin verse-making. At a later period of the session Horace forms also part of our public readings.

Do you prescribe to any of the students to get any portion of Latin verse by heart?—It has been always the practice with me in the junior class, to prescribe choice passages of the Classics we had read, to get by heart; and this session I have increased the frequency of recitation, and made it apply to fine passages of our own Classics, as well as the Latin. All my experience in teaching the youth of Scotland goes to prove, that there is no part of education in which they are so deficient, and so little susceptible of improvement, as in the power of pronouncing, audibly and intelligibly, much less eloquently, either their own thoughts or the compositions of others. The habits of pronunciation the students bring with them, from all the different counties in Scotland, are extremely bad, and so inveterate as to be almost unconquerable. The difference between the Scotch and English boys, in clear, articulate, and pleasing declamation, is greater than in any other point connected with a liberal education. And I think it so important to attempt a remedy, that I have devoted a portion of time, both in the senior as well as in the junior class, to recitation, as a regular weekly exercise. In the senior, this is done without encroaching on the regular time of the class, by meeting for the purpose on Monday morning half an hour before nine, which is the regular time. The passages, Latin and English (the latter chiefly from Shakspeare), to be then recited, are read out to the class by me on the Thursday before, at two o'clock, accompanied with such introduction and commentary as may appear necessary for a perfect understanding of their sense and beauty.

Do you use the Scotch or English pronunciation of Latin?—In prescribing the lesson, I generally read it after the English mode; in the ordinary examination of the class, I use the Scotch way, as the English might occasion difficulties among the students in understanding it, and produce a mongrel pronunciation—a mixture of the two—a danger we, in Scotland, are very much exposed to at present. Of late, many of my pupils require constantly to be admonished not to confound the two modes, but to keep them distinct, and be able to read wholly in the one way, or wholly in the other.

Are you in the habit of making use of impositions in cases of negligence or error?—Yes, but very rarely. At first, I thought of substituting impositions, *i. e.* the writing of exercises, for the system of fines which I found established; but the business was so multifarious, and the time so short, that to have these impositions properly performed, collected, and examined, I found at my outset would require more time than I had to spare; so I took the more summary way of levying small fines, which, upon the whole, I find to answer very well. The amount of these fines is thrown into the fund for prizes; and the feeling seems to be, that it is right that the unprepared and ill-behaved should contribute to the reward of others who are studious and well-behaved.

Will you have the goodness to state to the Commissioners the books in the senior class which you use?—We begin generally with Horace or Cicero. The general principle I go upon in the senior class is, that the time, at least till the Christmas recess, and a little longer, should be occupied with the writers of what is called the Golden or Augustan age; namely, Cicero and Horace in the public class, and as private studies, Livy, who is always read by a large proportion of the class, and examined upon in the presence of the whole. Those three authors fill up the time until Christmas, and perhaps for three weeks or a month later.

How much of Horace and Cicero do you read on an average?—It is not a great deal that we are able to read in the public class. I trust to the private studies for the quantity read, and in this way it is very considerable. In Livy, for instance, those who enter the class well prepared by their previous education, read often four or five books of Livy in the course of the session; and, as Dr. Hunter's school Livy, which is that generally in their hands, contains only five books, some come to ask me what they shall read next as private studies. As to the authors who are taken up in the general class, I conceive it to be of less importance that a great deal should be read than that it should be read well; because, in a class which has little more than five months in the year, and only five hours in the week of regular work, it is quite impossible to read a great deal, without doing it in a very slovenly way. My idea of what the construing of the Classics with such pupils should be, is, that there should be presented to the youth a specimen of the manner in which the Classics ought to be read, rather than that they be enabled to say, they got through so much of this book, and so much of the other. Those who are able have an ample career open for them in their private studies, and they make very good use of the opportunity; but what is read in the class I consider as a text for discussion, both on the subject-matter of the author read, and upon the points of syntax and grammar, antiquities and geography, and every thing which can furnish illustration to the author, and excitement, improvement, and amusement to the pupil.

What do you read after Christmas in the second class?—Juvenal, and alternately Tacitus and Quintilian. I have the intention also of varying these with Lucretius, Lucan, and Pliny.

Have you ever thought of making use of those collections of speeches from Livy, that are a good deal in use in the English schools?—No: I read Livy in the second class, merely as private studies at the two o'clock hour. I would rather they read the story right forward, as they will thus read it with more interest, and will meet with speeches enough in their proper

and natural place. I recommend the twenty-first and other books, where the interest is great in the subject itself—the second Punic War, and in the fates of Hannibal and Scipio; for, as I said before, I consider that as a very important point to be attended to in private studies, as, unless you allure the young student by the interest of the subject, you cannot expect so many to join a private class. Relying upon the interest which this part of Livy's narrative cannot fail to have, I have adopted this year, what I conceive to be the best method of initiating the pupil into the habit of speaking Latin—I mean, by holding conversations in that language upon the particulars of the story in the book of Livy which they happen to be reading. They are already imbued with the Latinity of Livy, from having read it so lately, and in answer to the questions proposed to them, they fall naturally into the very expressions of Livy.

Do you not find that the boys educated at the High School have read these books of Livy?—Yes; and accordingly, the arranged list of private students, with the quantity shown up by each, which is exhibited in the room, consists of two columns; the one containing the names of those to whom Livy is *old*, and the second of those to whom it is *new*, all having been instructed to mark on the slate which is sent round how many chapters they have read, and whether they have read it before or not. To nine school-boys out of ten, a second perusal of Livy is perhaps more useful than the first; and as those to whom it is not new, get over more ground, they become useful as solvers of difficulties, their ability to do so being at the same time the best proof of accurate preparation. Such students are promised immediate promotion to another book which shall be new to them, as soon as they shall show that they have no more to learn in what they have read.

Do you frequently require written translations of passages from the higher Classics?—Yes, they form one of the ordinary weekly exercises; they come as often as any other.

Do you consider that an exercise of very great use?—Certainly; of a poet I often have poetical translations; and in the other authors I very rarely give it from a passage that has not been translated in the class; but, being translated, it is required that it be thrown into such English as shall not indicate that it is a translation.

Are there no public Examinations in your class at the commencement or at the end of a session?—No further than that every body is welcome to enter who chooses. There are no days in which there is any public announcement of such a thing. I should be anxious to give a little more publicity to the delivery of Prizes, and I have told the students sometimes that I should be happy to see their friends on particular occasions; but the truth is, the class-room would not hold a great many additional auditors.

Does the Principal make it a practice to be present at any of the Examinations?—He has not visited my class.

Nor at the distribution of Prizes?—No.

With regard to the subject of Prizes, will you have the goodness to state the plan according to which they are awarded in your class, and also any suggestions you may have to offer upon the subject?—I spoke before of the subjects of those written exercises, to the best of which prizes are assigned by the town. The subjects are given out about the beginning of the year; the 20th of March has generally been the latest day for giving them in. These exercises are enjoined to be written in a hand different from the student's own. As, in the course of the year, I become acquainted with the handwriting of a great many, to prevent the possibility of my knowing whose exercises they are, I wish them to be written out by another hand. They must be accompanied with a sealed note, containing the name of the author, and an attestation that the exercise is his own unassisted performance. On the back of that sealed note, as well as at the end of the exercise, is the motto he has chosen, by which it is recognized to be his, in case it should prove successful.

What are the subjects you generally prescribe—are they Antiquities, or what?—I propose a Prize, *first*, For the best copy of Latin Verses on a subject prescribed:—*secondly*, For the best original Composition in Latin prose, such a topic being prescribed as may give scope both for some narrative and detail, after the manner of Livy, and some Ciceronian declamation:—*thirdly*, For the best English Essay on some point of Roman antiquities or literature, such as the constitution of the Roman Senate, and the circumstances in which it agrees with and differs from the British Parliament; the Constitution of the Roman Army; the Plan and Form of Roman Encampments, with Drawings of the Roman Camp; the comparative merits of the Æneid; the character of Milton as a Latin poet, with a verse translation of his poem on Spring; or any other subject appropriate to the business of the class, and of which the pupils may already know something, and ought to know more:—*fourthly*, A Prize for Declamation or Recitation, which is awarded by the votes of the students themselves; and I have generally given a Prize for the greatest attainments in Ancient Geography.

Do the Declamations take place in your presence?—Yes, before the whole class assembled for that purpose, at an extra half hour every week.

Have you generally found that the decision which has been made by the majority of the class has accorded with your own opinion?—Yes; in general it is right upon that point. I have sometimes given an additional prize when the votes for two candidates are nearly equal.

Are there any more prizes that you give?—A prize is also given to the best of the *private students*, that is, to him who has shown up throughout the session the greatest amount and most accurately prepared. Sometimes also prizes are bestowed on the best specimens of Translation from English into Latin, or the contrary. Upon the subject of Prizes, I may add, that for the last two years the Society of Writers to the Signet have gifted a gold medal to be adjudged to the best Latin scholar in the Senior Humanity class, who is selected according to a principle laid down in a minute of that body.

University of Edinburgh.

Professor Pillans.

4 December 1826.

Do you consider it would be an advantage if there were Public Examinations, and a more ceremonious distribution of the Prizes before the whole College?—Unquestionably it would be of great importance. I should think it an effectual means of securing in the youth attention to their studies, if the Degree of Bachelor of Arts were revived, and conferred at some intermediate period before the termination of their Academical Curriculum.

What is your principle in the distribution of these Prizes; are they given usually in books, or are the students allowed to purchase a book for themselves?—I have always given the prize-books myself, endeavouring to make the money go as far as possible in the purchase of such books as I thought would be useful to students; and I deliver them myself, on a day announced beforehand, in the class, endeavouring to make the occasion as striking and impressive as possible.

Is there any inscription on the book, to denote that it is a prize?—There is an appropriate inscription, lithographed or written, and signed by me.

You do not, then, on any occasion, give the money to the students, allowing them to purchase more valuable books?—I have never given to the students any part of the money allotted for prizes.

Does the collection of fines make a considerable addition to the prize-money?—They have occasionally amounted to from £3 to £4 in the senior class; but the sum is likely to be reduced, both because I have diminished the amount of fine for each particular offence, and because the discipline of the class is directed to prevent, rather than to punish delinquency, and is becoming more and more efficient from the suggestions of experience.

Into how many prizes is the sum divided?—I have been always led, from my knowledge of individual merit, to assign a greater number of prizes than was perhaps altogether justifiable, on the principle—*honores magni quippe rari.* The number of Essays, of nearly equal merit, has often led me to multiply the number of prizes; and in that case I did not keep a regular account, having generally gone considerably beyond the sum allotted.

Is there any plan you would be desirous of suggesting to the Commissioners, for the purpose of introducing Public Examinations into the class in the presence of the other Professors, or in any College-hall, if there were one?—If there were a College-hall, it would not be difficult to arrange such a plan.

Might not the Library be used for that purpose, when finished?—I think it might, if it were agreed that public examinations should be held.

Do you consider the want of any such exhibitions, as young men are enabled to go through in the English Universities, as a defect in the system of the Scotch Universities?—It appears to me a defect. There is, however, something of the kind at Glasgow, where they have a hall for the purpose.

Is there any other method by which a young man in your class can distinguish himself, except those you have now mentioned, which are, the class prizes, and the Professor's knowledge of his proficiency?—Among the students themselves, the character and status as a scholar, that a young man holds, is very much determined by the appearance he makes in the daily examinations, and particularly by the frequency with which he rises in his place to answer questions put to the whole class, but too difficult for all but a few to answer; and if those few be reduced to three or less, their right answers are recorded to their credit—a distinction not a little coveted and esteemed. The youths who seldom fail to avail themselves of the general invitation to rise and answer a difficult question, soon become objects of notice and attention to the rest, and are looked up to as superior scholars. The same thing may be said with regard to extempore translations. I propose a passage for those to stand up, who see the meaning of it soonest. In the ordinary business of the class, various methods present themselves of distinguishing talent and acquirement.

Have you a Library in your class?—I have.

Is it unconnected with the General Library?—Yes; it was established in 1823, by donations of my own and some of my private friends. We have about 400 volumes. The foundation of the Library was a donation by me of Valpy's edition of the Classics, 130 volumes, of which 95 are already published, and in circulation among the students. Many young men, in my class particularly, did not think of applying to the general Library, both from the great demand upon it, which made it difficult for them to get the book they wanted, and even to wait for their turn; and because it was inconvenient to many to advance the deposit. In a private class, it is easily arranged without any deposit.

How is that managed?—By two students of the class, who attend on the Saturdays. The catalogue is printed, and the only steady source to which I can look for the binding of the old books, and the purchase of new ones, is the sale of that catalogue to those who mean to avail themselves of the Library.

Do you find that young men resort very much to it?—Yes, particularly students from the country, who seem to regard it as a great privilege.

Have you any remarks to offer with regard to the management of the General Library of the College?—Beforesaying much upon that subject, I would require to be better acquainted with the proposed arrangements in the new apartments. The want of accommodation at present may be an apology for the mode in which it is now managed. There ought certainly to be more than one wicket for receiving and giving out books. As long as there is but one wicket, and two Under-Librarians to serve the youth, it is discouraging, and many of those most disposed to read, never attempt to supply themselves with books from that source, owing to the difficulty and loss of time it exposes them to. Indeed, it was partly on that account I was led to think of establishing a separate library for my own students. A library that professes to supply the demands of 2000 students, besides Professors' and other claims, should have more than one wicket, and two or even three men on duty. There should be not less than three or

483

four wickets, with at least one person at each. How far the funds of the Library might admit of such an arrangement, is another question.

Has it occurred to you, in the management of the General Library of the College, that recourse might advantageously be had to the students themselves, as you have done in the management of your Class Library?—I cannot but think it might: but upon suggesting such a plan in the Senatus, I was told that it had been tried and found inconvenient. I never was quite satisfied upon what principle it was found inconvenient: it appears to me practicable enough, there being no want of young men, for example, in my own class, trustworthy; and who would think it a great advantage, for very small pay, or for no pay at all.

Would it give them an additional facility of getting books?—Yes. I recollect, one objection stated to it was, that these young men had occasionally taken out books to lend to their friends, and in that way the Library had suffered loss. But some checks might be established to prevent that, if it was thought a great evil.

Have you found that inconvenience has been sustained from there not being a sufficient number of copies of the works to which students had recourse, in the General Library?—I rather think so, but I cannot speak with certainty on that subject.

Have you ever been a Curator of the Library?—Yes, I was one year curator.

Are the funds, arising from the matriculation of the Medical and of the Philosophical Students, kept separate?—They are kept separate, I believe.

Do you approve of that principle?—I am not prepared to speak on the financial concerns of the Library, never having bestowed any consideration on the subject. The circulation of the books has always appeared to me, both when I was a student and as a Professor, imperfectly accomplished.

You have alluded to the subject of Deposits; do you consider them to be objectionable or necessary?—I think, in so very general a Library as ours, it is indispensable, unless, as in the foreign Libraries, the books were not allowed to be taken out at all, but the students permitted to assemble and read in the room.

What is the usual amount of the deposit required at this Library?—A guinea; it should perhaps be more, when the books which are taken out are very valuable.

Are students allowed to read in the Library itself?—They are allowed to consult books that are not given out.

Are there facilities afforded them for reading?—There are none to give, in the present state of the Library.

Do you know if that has been attended to in the arrangements for the new Library?—It ought to be.

By whom is the matter of the arrangement of the Library taken in charge?—By the Commissioners of the College Buildings (of whom Mr. Johnston has always been the most active), Mr. Robert Johnston, Baron Clerk, and Mr. Playfair. I have no doubt they will take care that the room be comfortably heated, and every facility given to the students.

Will you have the goodness to mention the subjects of such Lectures as you are in the habit of giving?—I am in the habit of delivering single lectures on occasional subjects, as they happen to derive a particular interest from the books we happen to be reading: such as, the route that Hannibal may be supposed to have taken across the Alps; the site of Horace's villa; on the roads and public buildings of the Romans; on public and on private teaching; on Latin versification, &c. &c. I have also a short course of lectures on the laws of the Twelve Tables, comprehending discussions on the early history of Rome, and of its language, as well as of the code itself, the nature and propriety of its enactments, and the customs and usages it sanctioned or gave rise to: another set of lectures on the subject of the ancient MSS. of the Classics, their materials, antiquity, and appearance, with an account of the most remarkable that exist, when they were discovered, and where they are now deposited: and a third on the life and writings of Horace. I have announced also for this winter a series of observations on the advantages and disadvantages of the Latin tongue, as an instrument of thought, and a medium of communicating it. These different courses of lectures, except the last, were written for and delivered in a third or advanced class of Humanity, which met three hours a-week, during two or three sessions. Whether I shall read any one of these in the senior or second class, I am doubtful, being well satisfied, that an hour occupied in listening to a written lecture, with youth of the average age and attainments of that class, is much less usefully and profitably employed than in examinations and short occasional prelections. The better such lecture is, the less it is attended to; the more learning and erudition it displays, the less chance is there of it doing them any good.

Are there any other matters, connected with your own class, that you would wish to have the opportunity of explaining or suggesting?—I may be allowed to mention, that I have introduced in the junior class, and occasionally also in one part of the business of the senior, the method of monitorial or mutual instruction. In the junior class, where alone it is regularly employed, it is used on the Saturdays only, and for the particular purpose of revising the lessons of the week. The class, consisting of 128, is divided into twenty-one divisions, of six each, including the preceptor or monitor, under the twenty-one most distinguished scholars, each of whom takes his turn with the rest in construing the lesson, but has the general superintendence and preparing for a report of what business has been done, and how each student has acquitted himself. These several reports are digested by the general censor into one, which guides me on the following Monday in calling up, to construe publicly the most difficult parts of last week's lesson, all those who made an indifferent figure in the Saturday's division, and exposing them, if this appear to be the result of idleness and frivolity. The very perceptible improvement that has shown itself since this method was adopted, in attentiveness and possession of the lessons, is the most pleasing proof of its efficacy. It is the same method,

University of Edinburgh.

Professor Pillans.

4 December 1826.

somewhat varied according to circumstances, which I introduced into the High School as long ago as the year 1812. There is still, I am aware, a considerable prejudice against the use of monitorial teaching in the higher departments of a school, and still more in a University; and the notion is too prevalent, that the method of mutual instruction is applicable only to the elements of ordinary reading for the children of the poor. It is considered rather as an economical expedient, than a new power in education. But reflection and experience have long since convinced me that it is a method applicable to many of the higher branches of instruction, within certain limits, and that it may be used even in a University with good effect. The elementary part of Mathematics is, of all subjects, that in which it appears to me the greatest advantage would result from the adoption of the monitorial method, as part of the process of teaching. Suppose an elementary Mathematical class to consist of eighty or one hundred pupils, who meet one hour a-day, and that it is desirable the instructor should know, both for his own sake and that of his pupils, how many come daily prepared to demonstrate the propositions given out the day before. To most young minds, the first entrance of Mathematical learning is so uninviting, that, if the time will not allow more than four or five, or say ten or twelve, to be examined by the teacher each day, the far greater number will not give that regular daily preparation which is indispensable to progress, in a science where no advance is made without mastering all that goes before. If, on the other hand, a certain number of diagrams, suited to the propositions given, forming the lesson, were placed round the room, and, care having been taken, by exercises in the class, to ascertain who were the most able and advanced scholars, one of these were stationed at each separate diagram, and surrounded with six or eight students to be examined by him, it is obvious that it might be ascertained, in the course of a few minutes, who were masters of the proposition, and who not; for a single step in the proposition is enough to satisfy the examiner that the student has accurately learned the lesson prescribed the day before, inasmuch as, if one link is given, he must be in possession of the whole. It is impossible he could advance one step in the demonstration, without knowing all the rest; whereas, in construing a passage in a Classic, one must take a whole sentence, or perhaps two sentences, before one can ascertain whether the pupil is master of the lesson or not, while one line or half a line in the process of demonstration is quite sufficient to satisfy the Professor, or his substitute the monitor, that that proposition has been mastered by the individual. In a class of Mathematics, two minutes might suffice for putting the teacher in possession of satisfactory information, as to the state of preparation of his whole class, be it ever so numerous. It would be vain to attempt the application of the monitorial principle to subjects either of Physics or Metaphysics, or Ethics, and it requires, even in those branches of education where it is most applicable, some dexterity and management, and experience. But if a public instructor, along with a moderate share of these, have also the confidence of his pupils, the machine will be very easily managed, and will produce none but the most important and beneficial results. Of all the modes of examination too, it is the most certain and the most useful, and ought to be considered as the greatest possible boon by a Professor who can avail himself of it, as it enables him to meet triumphantly the objection, which is so often urged against certain classes in our Universities, that the pupils become idle from being so seldom examined. During the single hour of meeting on Saturday, every pupil of the junior class construes and answers questions at least half a-dozen times; and thus the power of examining is multiplied, in my favour, in the proportion of twenty to one. I have hitherto confined the use of this method in the senior class to the private students, who are the most studious and farthest advanced portion of the class, and there it approaches to the nature of a friendly conversation, in which they solve each other's difficulties in Livy, and hear specimens of each other's construing. Those who have prepared the greatest amount of private studies are inspectors or monitors to the rest. In both classes, accurate and minute reports of the business done are made out by the inspectors, who are answerable for the lessons having been faithfully translated, and are liable to be appealed against on this point by any one in the division. Such appeals are heard and decided on Monday.

Do you think the session is sufficiently long?—I think there are none who go away who would not be the better for staying a little longer. It is impossible to say, in a class like mine, that there is any definite portion of work to be accomplished in a given time. We read and comment on the Classics, while the session lasts, without having any precise point at which it is proposed to arrive.

Do a number of your students leave you before the end of the course?—A considerable number do, chiefly of students from the country.

Then, if the session were prolonged, a considerable number of the students would not benefit by it?—Certainly, a very large proportion.

Do you find those students of your first class, who come back to your second class next year, make good use of the vacation in private study?—It has always appeared to me a very material disadvantage to our youth, that the studies of one session are not connected in such a manner with those of the next, that an account shall be taken of the intervening summer, and credit or blame attached, according as it shall appear to have been well or ill employed. With the view of remedying, in some degree, this defect in our system, so far as regards my own classes, and as a means of encouraging regular and systematic study during the long vacation from College business, I point out, at the close of the session, a course of classical reading to be pursued, according to a plan laid down, and the results to be recorded in a journal, where the readings of each *week* are registered, and the difficulties found insurmountable are stated for solution: And as an encouragement to enter upon and persevere in such a course, prizes are held out to those who shall prepare most accurately the greatest quantity. This has succeeded already, as well as could be expected in a thing so novel; and I have no doubt the number of *summer students* will increase for many years to come.

Do you, then, find the vacation, for the most part, profitably employed?—With regard to the great body of either class I have no means of ascertaining. A large proportion do not take more than one year of the Humanity class; and out of those who take two and three years, there have not been more than twenty, in any one session, who ever showed up a record of *summer studies*. I do not, however, despair of making the thing more general.

Have those who come to the second class improved since you parted from them in the first class?—Yes; particularly those whose studies have been registered in this way.

Attending to the age at which they come to your junior class, namely, fourteen and fifteen, are you of opinion that there is no evil in their being set free from any attendance at school for six months?—I presume it does not happen, in one case out of ten, that they are so set free; their parents take that opportunity of putting them to a private class of French or mathematics, or reading, writing, and accounts; or they have tutors at home. The number of those who are let quite loose is probably very small. Intelligent parents arrange the studies of their children, so as to fill up the summer with other branches of useful knowledge, which they have not been able to attend to in the winter.

Have you ever made the experiment of a summer class?—Yes, I have.

Did it succeed?—I cannot say it did not succeed; but the success was not so great as to have induced me to try it again since.

How many attended it?—I forget; I think about forty or fifty.

Was it your first or second class?—Both; there were about forty in each, if my recollection is right.

What was the length of that course?—Three months.

Are you aware, that so lately as the year 1741 the junior Humanity class commenced on the 1st of October, and continued to July or August?—I was aware of the fact, but did not know the practice continued so late as the middle of last century.

Did what was called the Private Class commence the 1st of November, and end the 1st of June?—I believe so.

Do you think there is anything in the circumstances of the students now to render it a greater hardship to continue in Edinburgh during that period of time, than there was in the middle of last century?—I believe it would be very difficult for them to attend beyond the usual time. It would be desirable that the session began a little earlier, and that the classes should all meet at one time. There is no good, for example, in the junior Greek and Latin classes meeting a fortnight of very interrupted time before the general meeting of the other classes. If there should be any alteration in the time of administering the Sacrament, it might, I conceive, be easily arranged that all the classes should meet on the 1st of November, or the middle of October.

Would you propose to continue the session to May a least?—Yes, I think it highly proper that the classes should continue full six months.

Do your classes continue until April now?—Generally to the middle of April. It has been usual to keep the junior class a week later than the senior; it would be better they began and ended at the same time.

Do you find the attention of the students relax towards the conclusion of the session?—Not at all; for then is the important time when the prizes come to be awarded, and the certificates are given.

Have you any remarks to make upon the system of instruction pursued in the other classes in the College, or as to the general system of education?—If I were to hazard any remark it would be, that the sequence of subjects that are studied in this University is not exactly what appears to me the best calculated for advancing general intellectual improvement. I think the natural progress of knowledge in the mind of a young man, after he has been well grounded in Greek and Latin at school, and has had the cope-stone, as it were, put upon his classical attainments in the Greek and Latin classes, is, to study Mathematics, either along with the Languages, or immediately after them. After Mathematics should come, I conceive, Physics, or Natural Philosophy, where the student would feel the benefit of his mathematical knowledge, and be called on to extend it. Those subjects, also, should be then studied, if they are to be studied at all, which are connected with the observation of nature, and where something is addressed to the eye as well as the ear; such are Natural History and Chemistry. To go to Natural Philosophy without a good foundation of mathematical knowledge is a preposterous proceeding, and a great loss of time. It is done, however, very frequently in this University. The second, at least, if not the first year of attendance upon the Language classes, might be advantageously united with the elements of Mathematics, if these had not been acquired, as they might easily be, before.

How would you proceed after the study of Natural Philosophy and Natural History?—It appears to me, that any course of instruction which directs the attention of youths to the operations of their own minds and the world of spirits should not take place so early as it does with us, but that they should have a good substratum of classical, mathematical, and physical knowledge, before they proceed to the obscurities of mind, which are too apt to captivate and bewilder a youth; and while he thinks he is about to arrive at great discoveries and certainties, he loses his hold of the classics in following out metaphysical subtleties, and chasing phantoms which elude his grasp.

Have you any opinion about the manner of teaching Greek in this University?—I do not think it possible to teach to good purpose, or with any very permanent effect, the elements of any language *ex cathedrâ*. That is a work which must be done at school: it is impossible that a country which trusts the initiation of boys in the elements of any language to a Professor in a University should ever produce good scholars in that department, except in individual instances, and these indeed are not exceptions, but only examples of self-instruction. As applicable to youth in general, it appears entirely out of the question.

University of Edinburgh.

Professor Pillans.

4 December 1826.

Do you see any difficulties there would be in avoiding to teach the elementary parts of Greek at the University?—Yes, very great; inasmuch as the present system has become incorporated with the feelings and habits and institutions of the country, and to attempt any other mode, without some previous improvement in the grammar and parochial schools, would be, I should think, so much labour lost.

Is it your impression that very few of the schools throughout the country are capable of communicating that degree of instruction necessary to prepare a young man to enter the higher Greek class?—Of the parish schools, extremely few.

Do you think it would be very difficult to find a sufficient number of persons, having a competent knowledge of Greek, to fill the situation of schoolmasters capable of teaching the elementary parts of that language?—I do not think it would be difficult, if there were some temptation in point of emolument; but, upon the present system, as it was embodied by the last Schoolmasters' Act in 1803, it will be found very difficult. The encouragement is so small, that you can hardly expect a man who has such a knowledge of Greek as we suppose necessary, to devote a lifetime to the teaching of a parish school, where his emoluments, including salary and fees, are very often under, and seldom much above £60 a-year, and where the Act of Parliament ordains that his house shall consist of not *more* than two apartments. With such acquirements as such a knowledge generally presupposes, he would look to higher objects. It is a common enough opinion, that it is of advantage to have a young man as parish schoolmaster who has a view to the ministry, because it secures a higher class of individuals; but that, as a general principle, has always appeared to me to be a capital mistake. A man who has views to a higher ulterior object, never does the duties of the inferior station well, when it happens, as in this instance, that the conscientious and able performance of those duties has no effect in promoting his views in the higher station he aspires to. I have known many instances of young men who had gone through a pretty complete course of academical education, and yet made very indifferent parish schoolmasters, for that reason. As soon as they were licensed to be preachers, their chief ambition was, not to teach the school well, but to preach up and down the country. The most desirable thing for Scotland would be, to raise the emoluments of schoolmasters, in such proportion as to tempt a man of respectable talents and acquirements to devote himself to that profession for life.

Are you of opinion that the system of examination should be extended to the philosophical classes of the University?—I have very great doubts upon that subject. It would be highly desirable, no doubt, to extend the examinations; but I hesitate as to the propriety of having a separate hour for the purpose. In recollecting my own feelings as a student, I do not conceive that much was gained by the students when one hour was set apart weekly for examining upon the lectures of that week. The best way, perhaps, of conducting examinations in the philosophical classes would be from day to day,—and that in one of two ways, either that the time, which is given, I believe, in almost all these classes, to a recapitulation of the lecture of the preceding day should, if possible, be employed in examining the students on the substance of that lecture. A few questions prepared beforehand by the Professor might lead to additional illustrations on his part, when he found any part of the subject not comprehended, and would produce much greater attention on the part of his students. The other way would be to stop suddenly in the course of the lecture itself, and call upon this one or the other to give the substance of what had been last stated. I conceive that one or other of these methods would be more likely to secure attention than any weekly examination, at an hour set apart for the purpose, speaking generally: for, after all, whether examination, however conducted, shall be useful or not, depends on the power and skill of the Professor in putting the questions well—a talent of rarer occurrence than that of lecturing.

Supposing there were a separate hour for examination and exercises every day, combined, perhaps, with the reading of such classical authors as were connected with some of the subjects of Moral Philosophy, might not that, in your opinion, be an improvement?—Certainly a very great one, but very difficult to carry into execution, from the press of other subjects, and the difficulty of getting hours that do not interfere with other Professors.

Are you aware at all of the system of instruction carried on in the Logic and Moral and Natural Philosophy classes at the University of Glasgow?—I have read Mr. Jardine's book, and have conversed a good deal with him.

Do you not think that system could be extended to the University of Edinburgh?—I think it desirable, if it could be done; but the good he did was, perhaps, more by the frequency of the exercises he excited the pupils to write, than by the actual examination.

According to his plan, could that object be attained without a separate hour daily?—I suppose not.

Are you aware that all those three classes have two hours each every day?—Yes.

Do you see any thing to prevent the introduction of examination and exercises during an hour each day in the class of Natural Philosophy?—I see none, but the difficulty of finding time. It ought also to be observed, that there is a class of students who attend this in greater numbers than any other University for what may be called amusement; they are in general grown-up persons who attend the philosophical classes in particular, and who could not be subjected to examination. A very considerable proportion of such students will be found in most of the philosophical classes. In the class of Chemistry, perhaps one-half are what may be called *amateurs*, and would not submit to anything like examination. This may be remedied by the Professor at the time of giving out the ticket, asking whether they intended to be examined or not; it would be necessary to leave it in the option of adult students, and indeed of almost all, except boys who have parents, to whom appeals might be made.

But for those who are going to Divinity Hall, to whom a certain course is prescribed, or for those who might intend to take a Degree at the University, supposing the Degrees to be

put on a different footing, are you of opinion it would be right to make examinations, and exercises, and attendance at a separate hour imperative?—Yes, I think so, certainly.

Or where the ticket that is given is one of a professional kind?—Yes.

Have you any observations to offer in regard to the subject of Degrees?—It has occurred to me, that by way of giving an additional stimulus to youth to study the subjects they are engaged in, it would be very desirable to have a pause in their progress towards a Degree and a public examination, with the power of rejecting or putting back a year if the student did not answer, within certain limits of knowledge; and that the revival of a Degree, which I believe once existed in this University, that of Bachelor of Arts, might be attended with very good effects, if we had a room for examination.

Supposing there were a restricted Curriculum made, and that a boy only attended the first or second Greek or Latin, and the Mathematical classes the first year, and then went to the second class of Mathematics, and to the class of Natural History, and so on, in that kind of way, might not two hours be allotted to each Professor with great use, without interfering with the general student who attended for amusement, who could still choose any class he wished to attend?—If any arrangement of that kind could be made, it would be very desirable; for one of the faults our youth are apt to run into (if the fault, indeed, is not rather the parents') is that of attending too many classes at once.

Are you aware, that so late as the middle of the last century, the Logic Class met three hours a-day during a session of nearly eight months?—I was not aware of that. It is a fault in our system, that we do not take charge of the classes the youth attend, nor of the order. There is an order of study prescribed for Divinity students, but I do not think it is the best order.

Have you any further remarks to make upon the subject of Degrees?—None occur to me at this moment.

As to the raising the Degrees in Arts altogether, you mentioned you thought it would be good to make a step, and have an inferior Degree; does any thing occur to you as to the way in which the higher Degree of Master of Arts could be rendered of more importance?—Certainly, at present it is quite in abeyance. The first improvement would be to have a public examination. At present, when a candidate for a Master of Arts has completed the number of classes he is bound to attend, he waits on each individual Professor who is engaged perhaps in other things, and dismisses him, it may be without putting a single question of importance; indeed, practically speaking, a man is almost sure of his Master of Arts Degree, who has attended the classes required, with hardly any examination. It would be very desirable to have public examinations and public examiners; but there might be some difficulty in finding the latter. They are appointed at Oxford for this express purpose, and receive pay for what they do, on examining the Scholars for Degrees.

If a young man could take his Degree with honour and distinction in this University, would it not become a very considerable object, and might it not be of great use to him in professional life?—Unquestionably.

Do you see any reason why the principle of such a system should not be extended to the Scotch Universities?—It does not occur to me that there is any solid objection. I think it would be highly desirable to make the degree something more than a mere name, that it might pass as a test of qualification.

And would you at the same time allow those who took the Degree to take it with greater or less distinction, according to their acquirements?—Certainly; but that would be a matter of subsequent consideration. Such titles might be given as *Senior Wrangler,* Senior and Junior Optime, &c., as at Cambridge; or there might be, as at Oxford, a set of *first class men* above the line, and second class men below. It would secure a much more general progress.

With a view to the same object, might it not be of essential use if there were prizes made the subject of competition, open to the whole students of the University, to be awarded publicly, so as to make a young man's name known throughout the country, by having gained a particular prize which was the subject of general competition, as is the case at the University of Oxford?—No doubt that would be highly desirable.

Are there any other suggestions upon this subject that occur to you?—None occur to me at this moment.

Does no difficulty occur to you as to the mode of determining the merit of the exercises, upon the supposition that there might be a great many of them not written by themselves?—No; I do not anticipate much difficulty from that; for there might be such an arrangement as should enable the examiners, whoever they may be, to subject the students to exercises written in their presence.

Have you any further observations to offer with regard to the subject of the Degree in Arts, or the Curriculum for the Degree?—I have stated all that occurs to me now on that point, as far as Degrees in Arts are concerned; and if this matter were new modelled and rendered more efficient, it would, perhaps, be desirable to make the Degree of M.A. a necessary step to that of Doctor of Medicine. A competent knowledge of Greek and Latin ought, at all events, to be reckoned indispensable.

Have you any suggestions to make to the Commissioners in regard to the constitution of the University, or as to any office-bearers you would wish to see established, or any alteration in the system of patronage at present pursued here?—I cannot say I have thought much upon that subject. It is not for me to give an opinion upon the question now before the Court. I would decline giving an opinion upon a subject of that kind, which is now before better judges.

Have you formed any opinion as to the expediency of having a Chancellor in this Uni-

University of Edinburgh.

Professor Pillans.

4 December 1826.

versity, or any Court of Appeal?—No, I cannot say I have turned my thoughts to that subject at all.

Are there any suggestions you would be desirous of offering in regard to the institution of any new class, or any different arrangement in the distribution of subjects, either in the Philosophical, Medical, or Literary classes?—No; I am not aware of any at this moment. Of course, in any thing I have said with regard to the arrangement of the *Ordo Studiorum*, or as to the Elementary teaching of Greek, I should hope it is understood I meant no allusion to individuals; and that if any innovation is to be made in those particulars, it ought not to affect the interests of any living Professor.

A paper was given in to the Senatus Academicus by the Faculty of Arts, in regard to the subject of taking Degrees; do you concur in the contents of that paper?—I imagine it was given in and prepared while I was abroad. I do not recollect the substance of it. I rather think I was not present at the meeting.

Is there any thing connected with the Discipline of the University, or the Authority of the Principal, or of the Senatus Academicus, which you are anxious to state?—No, nothing occurs to me upon that subject. If each of the Professors establish a good system of discipline in his own class, there will hardly be occasion for the interference of the Senatus Academicus; indeed, practically, I believe the instances are very rare of complaints of misbehaviour coming before the Senatus Academicus.

How do you account for the neglect of the study of Civil History in this University?—Why, there is one cause obvious enough; it is not necessary for taking any professional step. It is extremely difficult to give body and existence to a class which is not requisite for any particular profession.

Would you consider it to be a very important preparation for a class of Logic, and particularly of Moral Philosophy?—Certainly, the subject of History seems abandoned very much to the student himself. It is not a class of very long standing.

Do you think it would be expedient to make a regulation, that before a young man were allowed to enter your class, he should be made to undergo an examination in certain Latin books?—I think, as a general arrangement, that would be of little use, unless it were conducted by others than the Professor himself. Generally speaking, a Professor is too much interested in having a numerous class, to allow it to be presumed, upon the ordinary principles of human action, that he would reject a considerable number because they were ill prepared. It would not be easy to effect that, unless there were a sort of Board of Examiners, through which the students were to pass; and *that* it would be difficult to find.

Do you know, that at the University of Dublin, before students can be put on the books of the College, considerable examination, as to their knowledge of Greek and Latin, is required?—I believe it is managed by a Committee, and not by the Professor whose class he is to enter. The same thing is done at Glasgow, in what is called the Blackstone examination.

Are there any other remarks you would be desirous of suggesting, connected with the interests of the University, or the promotion of Learning and Science, either in the way of improvement or alteration in the System of Education pursued in this University?—There are none at this moment which occur to me.

At a Meeting of the Commissioners at Edinburgh, on Monday, 11th December, 1826.

the SOLICITOR-GENERAL in the Chair.

[There not being a quorum of the Commissioners, those present resolved to examine George Bell, Esq., Surgeon (who had been requested to attend on that day), and to offer his Evidence to the Commission. The Evidence was reported to a Meeting of the Commissioners on 29th December 1826, and was received by them, and ordered to be printed.]

George Bell, Esq., called in and examined.

George Bell, Esq., Surgeon.

11 December 1826.

You are a Member of the College of Surgeons, and also established in practice, in Edinburgh?—I am.

Have you turned your attention to the subject of the education of gentlemen intended for your profession, and to the state of the Medical School of Edinburgh?—To a certain extent I have, having been an Examinator at the College of Surgeons for nearly twenty years, and also having pupils of my own as apprentices.

Are there any suggestions you have to offer to the Commissioners, respecting the state of the Medical School of Edinburgh, and respecting the education of gentlemen intended for the profession of medicine in its different branches?—I would beg to offer a few observations with regard to the preliminary education that ought to be required before commencing medical study, and perhaps too with regard to the classes which ought to be attended in a University, either here or elsewhere.

Will you have the goodness to state what appears to you to be the fittest course of preliminary study that you would be inclined to require before the commencement of medical studies?—I will; is it with reference simply to those who intend to take a degree?

Are the Commissioners to understand that you would be inclined to exact a course of preliminary education, merely for those who intend to graduate at different universities?—There are three descriptions of students in a university. 1st. Those who intend to take the degree of M.D. at the university; 2ndly. Those who intend only to take a Diploma from the College of Surgeons, so as to be enabled to act as general practitioners; and 3dly, Those who study without the intention of taking a Diploma of any kind; and I presume it is the wish of the Commissioners, that I should consider only the first of these classes.

489

University of Edinburgh.

George Bell, Esq., Surgeon.

11 December 1826.

The Commissioners will be glad to hear any observations you have to offer, in regard to any of the three different descriptions of students you have mentioned, taking them in your own order ?—I presume that the Honourable Commissioners, in requiring my opinion, wish that it should have reference only to the first class, namely, those who intend to take the degree of M. D. in the University; and to the second class, partially for the purpose of illustrating the difference between the two. If this presumption of mine be correct, may I be permitted to offer a few observations respecting the Medical Degree, before proceeding to answer the direct questions of the Commissioners, that my meaning and intention may not be misunderstood ? The degree of M. D., and the mode of conferring it, in my opinion, involves a subject of great importance, both to the person who obtains it, and to the community at large. The possessor of it is presumed to have enjoyed a more liberal education, and to have made greater proficiency in his studies, than the ordinary Students of Medicine, and he is immediately elevated, as far as a mere Degree can raise him, to a higher rank in society, and he has obtained a passport to the circles of literary and learned men. How far this may serve his purpose in after life, depends upon his own conduct, and on the scientific acquirements he has actually realized during his residence at the University. The well-educated Physician is admitted, whatever may have been his birth, into society of the first rank, talent, and fashion in the country, and he maintains an ostensible and honourable station, wherever he appears; besides, he enjoys various privileges and immunities, some of which are not enjoyed by his less fortunate brethren who have not become possessed of the same degree. To enable and entitle the Physician, therefore, to step above his former rank, and to enjoy the privileges of his Degree, and that lucrative part of his profession, and the confidence of the public which every well-educated and properly-conducted Physician may generally command, every opportunity of acquiring preliminary, literary, and scientific information, as well as professional knowledge, should be laid open to him. If these observations be well founded, I would apply them to the present state of the Medical Degree in this University, and, observing in the *Statuta Solennia* that there is no pre-requisite stated of preliminary education, I would urge this ponit as far as may be consistent with the interests of the public, the pupils, and the University; if possible, I would make all their interests to coincide with each other, but certainly the public welfare is that which, in the first instance, ought to be looked after. The preliminary education or acquirements which I would suggest are—first, that students who commence their medical studies with the intention of graduating, should be required to produce testimonials of their preliminary education. In the first place, they should produce either their Degree of A. M., or testimonials of their having made proficiency equivalent to that degree in Latin, Greek, Mathematics, Natural Philosophy, Logic, and Moral Philosophy; or they ought to be examined by competent judges as to those points. I think French also would be a valuable acquirement, and Natural History ought to be attended in the course of the Curriculum. Secondly, they should give proofs of being acquainted with their own language.

And under the second head, as to attendance on the Medical Classes, I would say—first, the roll should be called daily. Secondly, there should be Examinations twice every week, on the subject of the preceding lectures, at additional hours. These would, first, go far to secure regular attendance upon the class; secondly, they would bring the Professor and the Students more in contact with each other; thirdly, the Professors might, in a conversational manner, communicate much useful information which is not quite suited for a formal Lecture, encourage the diffident, call out the latent ardour of the young men, excite their enthusiasm, induce them to follow out a subject of difficulty, and habituate them, early in life, to express themselves well upon professional matters,—a talent which, unless cultivated from the outset, is rarely to be acquired at a more advanced period of life, and which would not only be followed by much comfort to themselves and their patients in their professional intercourse with them, but tend greatly to the advancement of Medical Science, by inducing them to keep records, and perhaps publish such remarkable cases and observations as might occur to them in after life. The benefit to be derived by students from their attendance on various classes seems to be too highly rated. The value rests less in the contents of the lectures, than in the influence over the minds of young men, which is acquired by the Professor who delivers them. The lectures of the late Dr. Monro, Dr. Black, Dr. Cullen, and Dr. Gregory, and others, were taken in short hand, and numberless copies written verbatim as they were delivered: but no one ever ventured to read them to a class, although they confessedly contained an immense mass of valuable information. If the attempt had been made it would have proved abortive. The value of these lectures resided in their authors, themselves masters of their arts, who, by their genius and talents and industry, and scientific discoveries and zeal, acquired a mastery over the minds of the pupils, which elicited whatever zeal, and enthusiasm, and talents they possessed, and thus riveted in their minds what was propounded to them. By means of these men, and of some of their illustrious predecessors and colleagues, the Medical Department of this University was raised to the highest pitch of celebrity, and there it may and must remain, if those means be adopted from time to time, which the march of events renders expedient and necessary. The means best adapted for this purpose, in so far as Medical Science is concerned, will, I have no doubt, be suggested and carried into effect by the talents and zeal of the learned Professors who now occupy the Chairs of its various branches. On this part of the subject it would be impertinent for me to offer any remarks. but I would most humbly suggest, that their labours might be rendered doubly valuable, were they to render themselves as popular as their illustrious predecessors, and which I do believe it is in their power, in a great measure, effectually to accomplish. I am quite aware of the great change which has taken place within the last 60 years, and even

University of Edinburgh.

George Bell, Esq., Surgeon.

11 December 1826.

within my own recollection, and of the increased difficulty which has taken place in the approximation of the Professors and the students. This has arisen partly from the great increase in the number of the students, so that so long as the present plan of teaching and studying is continued, it is almost impossible for the Professors to be acquainted with the qualifications of the pupils. One great incentive to exertion, and a powerful preventive of idleness, the approbation or disapprobation of the Professor, is lost to the pupils; and every one, who has paid any attention to the education of young men, knows how much talent and zeal often lie hid under apparent frivolity, idleness,, and dissipation,which might be reclaimed by a little attention being paid to their *morale* by those who are placed over them.

By adding, then, to the usual plan of study, first, Examinations every second or third day in the week throughout the session, of all those intending to graduate, the Professors would become acquainted with their pupils, and acquire a strong hold over their affections, and, by encouragement or reproof, often prevent them from running off the course, and ultimately render the Examination for Degrees, not only almost unnecessary for the purpose merely of ascertaining their capacity, but in reality, make it of inestimable value; as, instead of a mass of crude raw materials, not composed by himself, the Professors would get from the candidate, a Monograph, or dissertation or essay on some subject, which had for a long time attracted his attention, which he had studied and made out, and enriched with quotations from our best classical authorities, fortified by observations of his own, and capable of instructing even the older members of the profession, and to which he might look back in after life with pride, and which might prove the pivot of his future reputation. Examples of such were by no means rare in former times, and I trust, that under the auspices of the present Medical Faculty, aided by the exertions of this Honourable Commission, such Dissertations are destined to become more numerous than ever. Secondly, the introduction of Essay writing, and of competing for Prizes in each class, affords an easy and obvious method of securing, with the generality of students, a certain quantity of study, as it will show the extent of their reading, and tend to improve their talent for composition, and compel them to acquire a knowledge of the value of words, and of the English language, if that be their mother tongue—an accomplishment too much neglected and despised by the young students of Medicine in this country. Thirdly, the adhibiting in red ink to the name of each pupil, in a private list or *roaster,* to be seen only by members of the Faculty, the general character and *status* of each.

Would you propose that, with a view to guide the Members in Examinations for Degrees? —Yes, it might enable the Professors to judge how far a more strict and protracted examination may be necessary, to ascertain the qualifications of the student.

You mean such list to be a record of their proficiency?—Yes, and as a most valuable reference in after life. Suppose a person had a situation offered by Government, this would be an evidence to refer to, to induce Government, or any person, to trust him, in consequence of his previous good character.

The Commissioners would be glad to hear any suggestion you have to offer in regard to the present Curriculum for Degrees recently adopted by this University?—So far as it goes, I take it to be an exceedingly proper one, and a great improvement upon the former ones of 1823, 1819, and 1812, but it appears to me it does not go far enough.

Will you have the goodness to state, whether there are any additional Classes you would be inclined to propose, as imperative upon the students to attend, or whether you would be inclined to prolong the period of study; or are there any other suggestions, on the subject of the Curriculum that have occurred to you?—With regard to the addition of Classes to the Curriculum, I would say there ought to be an additional class of Practical Anatomy, another of Practical Chemistry. I would make Clinical Surgery, Natural History, and Military Surgery, on the principle that so many Physicians enter our Fleets and Armies, and must necessarily be often called in to Surgical cases, imperative; and there should be a separate course of pure Surgery, without being mixed with Anatomy, except so far as observations on Anatomy may be necessary to explain the subject of the lectures. I would make them attend three of the classes, certainly more than once, namely Anatomy, Chemistry, and the Practice of Physic. I would make them attend Clinical Lectures twice—I mean Medical Clinical Lectures; and I would think it a great addition, and almost be inclined to make it imperative, that students should attend Medical Jurisprudence.

When you recommend attendance on the classes that you have mentioned, oftener than once, do you think it would be advantageous to require such repeated attendance in the University, or would you allow an attendance upon Private Lectures for a six months' course, as equivalent?—I would leave that optional to the students, but I would require the private lecturer to have given some proof of his capacity for lecturing; for example, he ought to be a Fellow of one of the accredited Colleges of Physicians or Surgeons, and have practised his profession for five, or a given number of years. Of course it should be imperative that they attend, at least once, all the classes in the University.

The additional attendance you would allow to take place in any way they chose, requiring them to attend a class of six months' duration?—Yes; I would permit this latitude with all the classes, but it might be absolutely necessary with regard to Practical Anatomy; because, although they may attend it at the University, yet I am afraid so many attending in one place could not be accommodated; but there are four or five teachers of that branch in Edinburgh; and there would be plenty of others, if it were encouraged.

Do you consider that the more extended course of study, which you have now recommended, could be embraced within the period of four years, or would you be inclined to propose an additional year?—That is a matter for consideration. I would prefer, certainly,

491

University of Edinburgh.

George Bell, Esq., Surgeon.

11 December 1826.

that five years were allotted for the course of study; but I doubt whether the finances of the young men studying here would bear so protracted a course; and I think, that all the classes I have proposed may be taken in four winter and three summer courses.

Do you consider that the object might be partly gained by requiring additional attendance upon Summer Classes, and prolonging the Winter Session?—Yes, I think so; by attendance on Summer Classes, and dividing the Session into two of five months each, or into one of six months and another of four.

Do you think that the circumstances of any great proportion of the students are such that the adoption of such a plan, as you have now proposed, would be any serious hardship upon them?—Speaking strictly with regard to those who are to take the Degree, I should say, I do not think so; for they are in general those who are best able to afford it. If you take those in the other ranks, it would be a great hardship upon them.

Is it not a fact, that a great proportion of the Medical Students who come to Edinburgh, come for the whole year, and do not leave it during the summer, for any considerable period of time?—It is not easy to form a notion as to the exact proportion; but there is a considerable number who remain either in Edinburgh or the neighbourhood, or are travelling about Scotland for amusement and information, who might be attending here quite easily. Those who come to take Degrees come for business; and they would make it their object to attend the summer classes, if these were made imperative and useful.

Have many of the Private Lecturers classes, which are attended during the summer?—Several of them have: there are two classes of Practical Anatomy, and two of Practical Chemistry, and I believe one of the Practice of Medicine, and of Midwifery and Materia Medica.

Do you understand that these summer classes are well attended?—Very well in general, in proportion to the number of students remaining in town.

You have mentioned that you would recommend the establishment of a separate class of Surgery; is there any other additional class of Medicine you would recommend?—I think there should be a separate class of Clinical Medicine.

Would you limit the teaching of Clinical Medicine to one individual?—Two would be better, for it is the most important of all the branches, after Anatomy and Chemistry. It is by that means they can best learn acquaintance with disease.

Does it appear to you that there would be any disadvantage in the other Members of the Medical Faculty performing the duties of a Clinical Lecturer?—I should think, that if what I propose were adopted, and you increased the Examinations, the other Professors would be fully occupied with their own classes. It is a very laborious fatiguing duty, that of a Clinical Professor, and I think it would require a person's sole attention to be devoted to it. I rather think it would be better in the hands of one or two, who were constantly attending to it, provided that they are well qualified and sufficiently zealous, than that there should be a perpetual succession of changes.

Are there any other observations that occur to you, relating to the subject of the Curriculum?—I neglected to mention the class of Midwifery; I would also suggest that every Professor should have a Text-Book; I would mention too, that there should be a separation of Surgery from Anatomy. Then there is a subject that does not come exactly within the question, but perhaps this Commission might have great influence in getting it remedied. It appears to me, that in the Hospital, the wards are infinitely too small, and not calculated for Clinical patients. If the students are divided between two Professors, each taking 70, that is a great deal too many for a room of this size, and to stand in it for an hour among a number of sick patients, annoys them prodigiously, and is particularly dangerous to the students themselves. Every year, when typhus fever prevails, we see the students laid down by dozens: if there be any truth in the existence of infection, this can only be occasioned by touching the beds of the patients, and breathing for so long a time a tainted atmosphere, which cannot be avoided. If the Managers of the Infirmary could arrange matters in such a way as to give the Professors larger wards, probably they might be induced to build them; it would be an improvement of great importance. Then, with regard to the present mode of attendance, I would suggest that the Professors who are now in attendance, should take one ward for six weeks, and should not allow two sets of students to go into the same ward on the same day, for it is particularly annoying to the patients.

Do you know if at present there is more than one set of students allowed to enter the same ward?—I understand one Professor takes one ward, and another takes the other; but what I allude to is, that the pupils attending one Professor should not be allowed to enter the ward under the charge of the other Professor, as the patients would thus be annoyed by two sets of students.

Are there any other points connected with the Classes of the Curriculum, upon which you have any suggestions to offer?—With regard to Clinical Surgery, the Clinical Professor labours under great disadvantages; he has nothing to say in the management of the cases; he is obliged to lecture on the practice of others, and is thus restrained in giving his opinion, more especially if the mode of treatment be not accordant with his own view; he cannot display the errors or mistakes of others, as he would and ought to have done, had they been committed by himself. So that much of what he says may have the appearance of indecision, or a wish to preserve good terms with the attending Surgeon; and the students will not place that confidence in his dicta which they really deserve. To enable the Professor of Clinical Surgery to be fully effective, he ought, with proper assistants, Surgeons, to have a male and a female ward in the Hospital constantly kept open, and devoted to Clinical Surgery alone.

Will you have the goodness to favour the Commissioners with your suggestions upon any other points you may have noted down?—There has been a great deal of talk about the intro-

University of Edinburgh.

George Bell, Esq., Surgeon.

11 December 1826.

duction of a separate degree in the University, such as that of Bachelor of Medicine. As the degree of M. D. is the highest that can be given, if you introduce another degree, it must either be of an inferior description to the M.D. as it stands at present; or the latter must be raised by requiring superior education, more time, and greater expense in acquiring it. If this were carried into execution, many of the intended Graduates could not, I fear, bear the expense, and still more, could not spare the time requisite, as ere the period arrived for taking the higher degree, they have probably obtained a settlement for life, and cannot then return from a foreign country for that purpose. On the other hand, if a lower degree were to be introduced, it would be considered inferior to a diploma from the College of Surgeons, if the qualifications and course of study were not raised to their standard. Now, it may be seen from a Table which I shall produce to the Commission, that the course of study required by the College of Surgeons is more comprehensive even than that required by the Statuta of the University for 1826, from Candidates for the degree of M.D., though less by one year in point of time; so that I do not see any good reason for introducing a new degree of B. M.—*The following is the Table referred to:—*

Comparison of the Courses of Study required by the Statuta Solennia of the University, and by the Regulations of the Royal College of Surgeons of Edinburgh, A. D. 1826.

The duration of the course of study is,—

For Medical degrees . . Four years;
For Surgical diplomas . . Three years.

The Courses prescribed by the University must be delivered by Professors in an University.

Those prescribed by the College of Surgeons may be delivered by Professors in an University; or by Resident Fellows of the Colleges of Physicians and Surgeons of London, Dublin, Glasgow, or Edinburgh.

Besides, it appears to me that the University and the Surgical School ought, and must always support and understand each other, if they be properly constituted and conducted. There ought to be no rivalry, except in the honourable attempt to render their respective Curricula and classes as perfect as may be. Every additional number of students attracted to Edinburgh by the Surgical School may be regarded at the same time as so many added to the University, and *vice versâ*. In this belief, I would farther observe, that as the degree of M.D. is the highest honour to be acquired at the University, so that of C.M. is, and ought to

493

University of Edinburgh.

George Bell, Esq., Surgeon.

11 December 1826.

be, the highest that can be conferred on those who are Masters of the Art and Science of Surgery. And it is humbly conceived there can be little doubt of the propriety of such a degree being conferred on those who may merit it, for the same reason that the degree of M.D. is bestowed on those who excel in that branch of the profession. But it has been stated, upon the highest authority, and it is the general opinion of the profession, that much of what would constitute the subjects of examination in advancing to a degree in Surgery, can be taught by practical Surgeons only, and that the education for the latter requires some additional classes, which are not to be found in the University Curriculum. It therefore follows, that the interests of the profession and of the public at large, render it highly expedient that some means should be adopted for the institution of this degree in this country; and I would humbly suggest, that the power of conferring it might be safely entrusted by the Crown to the Royal College of Surgeons, which has long been incorporated as a Royal College,—and there is every reason to believe such a grant would not interfere with the rights or privileges of the University.

Is the degree of Master of Surgery conferred by the College of Glasgow?—Yes, I believe that University has lately adopted some practice of this kind.

Have you had occasion to know what has been the result of it?—No, I have not.

Does the degree of Master of Surgery stand in estimation in the medical world?—The term is but little known in this country. I merely suggested it as an improvement on the Chirurgical diploma, or rather as a higher honour in Surgery.

Are there any further observations which it occurs to you to make relative to the Medical School of Edinburgh?—I was thinking of the comparative state of the numbers of students who have taken diplomas at Surgeons' Hall, of those who have attended the University of Edinburgh, and of those who have taken the degree of M.D. there. I should wish to show the apparent effect which increasing the requisite qualifications for diplomas has had on the number of Candidates at Surgeons' Hall, by which it will be seen that these numbers have kept pace with the improvements of education, although I am aware that other causes were operating in the same direction, but not to such extent. The same observation is applicable to the University degree of M.D., the number of Graduates having increased during the same periods pretty nearly in a similar ratio: For example,—Previous to 1801, the diploma of the College of Surgeons was not so much valued as it now is; students were obliged to attend the classes in the University for only a very short time. In the eight years subsequent to 1790, the average number of those who obtained diplomas was 23 per annum; during the same period, 34 students graduated at the University. The average number of diplomas for the next eight years, from 1797, was 37; of Graduations at the University, 49.

Did the College of Surgeons introduce an improvement into their Curriculum about the year 1801?—Yes, or 1802. In the third eight years after 1790 (that is, after 1805), when the Professorship of Surgery to the Royal College of Surgeons was coming into free operation, and higher qualifications were required from Candidates for diplomas, the numbers amounted to 77; that of the Graduates in the University to 52. During the fourth period of eight years, the average was 122 at Surgeons' Hall, and 96 graduated in the University.

What years are embraced in the last period of time you have mentioned?—From 1813 to 1821; and the last five years which I have not yet mentioned, they have averaged 131 at the College of Surgeons, and 115 at the University. With regard to the Students of Medicine at the University, the average, during the last five years of the war, was 797; during the five years immediately after peace was concluded, it was 772; and the average of the next five years, ending last summer, was 861, which shows that there was a great increase, apparently in consequence of the demand created by the war—that that demand became less for a time, when the war ceased, in consequence of a great number being placed on half-pay, but instead of diminishing to the extent at that time expected, it remained pretty nearly equal between 1815 and 1820. Since that time, the number has increased from 80 to 90 per annum. In forming an opinion with regard to the additional classes which ought to be attended, the difficulty I had was to make out something that might answer the purpose, and yet not diminish too much the number of those who take degrees. This is my view of the question. I should rather think that the number of those taking the degree of M.D. will not be diminished by the additional expense attending the classes now recommended, but on the contrary, I would expect, in the course of two or three years, the numbers shall be increased by the increased value likely to be borne by the degree, from the improvement in education of which it is an index. It must be kept in mind, that the number of Graduates has been regularly increasing since the peace, and had been increasing for many years previously; and I am led to infer, that the Professors in the University showed that they did not expect a diminution, as I am informed they proposed in 1808, to add £11. 7*s.* to the graduation fee; so that, in place of £13. 13*s.* formerly charged, the student would have had to pay £25 and upwards, besides the regular class-fees, as the University expense of his Graduation. This proposal was promulgated among the students, who remonstrated with the Professors against its affecting those who had entered previous to its promulgation. The Senatus rejected their petition, when the whole of the students complained to the Patrons, who interfered, conceiving it to be their duty to regulate these matters. During this discussion, Government laid on a tax of £10, when the Professors withdrew their enactment. The number of Graduates was not lessened by the increased expense of the tax. On a subsequent occasion, in 1812, the Senatus showed they were not afraid of a diminution, when they applied to the Patrons for permission to increase their fees by £1. 1*s.* This has been levied, and ever since, an increase instead of diminution has been almost regularly going on. During the war, a very great and unusual demand was created for Medical officers for the Army and Navy, which often could not be complied with. It had the effect, however, of attracting a considerable increase of students of Medicine, which

University of Edinburgh.

George Bell, Esq., Surgeon.

11 December 1826.

went on until the conclusion of the war. Instead of diminishing, they remained pretty nearly stationary; and during the last five years, they have increased by a large amount over the preceding five years. One would naturally have expected, that on the conclusion of the war, the number would have become less, as the demand ceased, but the numbers were kept up by the influx of half-pay Medical officers, who repaired to Edinburgh for the purpose of availing themselves of this opportunity of improving themselves in such branches of general Literature as well as of Medical Science, as they had been unable to attend minutely to during the first part of their Academical course, and many perhaps to spend their time usefully and agreeably until they could obtain a permanent settlement in private practice.

Have you any observations to make with regard to the diploma granted by the College of Surgeons?—The expense of the Surgeon's diploma is infinitely less than that of M.D. The whole expenses amount to about £7. 5*s*. The Examinators receive of that a very small sum: For example, 181 students were examined last year; of these, 159 received diplomas; 22 were remitted to their studies. There are twelve Examinators, each of whom received £13. 2*s*. 6*d*., making in all £158. 10*s*. among twelve individuals. If this number of students had been examined for a degree of M.D., each Professor would have received above £300., besides the class-fees,—or £1,800 and upwards would have been given by the students as the price of their Examinations. The increase of diplomas given by the College of Surgeons has been considerably greater in proportion than that of degrees of M.D. by the University: For example, during the eight years after I entered the College in 1798, the average number of diplomas was 37 annually; in the next eight years, 77; in the next, 122; and in the last five years, 131 per annum. So far as one can judge, the increase has been in proportion to the improvement of education, and the increased qualifications demanded by the College. The increased expense to the student, from the number of additional classes to be attended, no doubt was considerable; but it must be observed, that neither the College, nor any of its individual members, put any additional expenses on the students for their own use; and almost the whole of the sums thus collected have been returned to the students, in the shape of a *bonus* to them and their successors,—I mean, by expending it in the purchase of a Museum of Morbid, Comparative, and Healthy Anatomy, which bids fair to become one of the most splendid in Europe, as it now is nearly one of the most valuable and useful in Great Britain, requiring only a trifling aid from the munificence of his Majesty's Government, to have it displayed in a proper building, so that it may be opened to the convenient inspection of the whole Medical public, as it now is to all the pupils attending the University, under the most liberal regulations. But I have said the poverty of the College, which has expended a very large portion of its funds, not less than £6,000, in bringing together this splendid collection, and the Museum left to it by the late Dr. Barclay, incapacitates them from rendering it so extensively useful as it might be made, were a proper building erected for its reception and preservation; and I humbly conceive, that if a Committee of the Honourable Commission were to inspect the Museum, they might be induced to recommend (though perhaps extra-officially) to his Majesty's Government to grant a small portion of the public money, to raise from obscurity an object of such public importance and national utility. The consequence would then be, that the Alumni of the College of Surgeons of Edinburgh, who are dispersed over every quarter of the globe, would collect every object of Morbid Structure which they could procure, and transmit them to the Museum; and their exertions would not fail to be stimulated by their old masters, with whom they keep up a constant correspondence. The experiment has been made on a large scale by the Professor of Natural History, and it has succeeded; and I have no doubt but that a recommendation from this Honourable Commission, if you approve, after inspecting it, would secure the favourable consideration of the Government.

In what manner are the Examinations by the College of Surgeons conducted; are they *vivâ voce*, or in writing?—I have not been an Examinator for four or five years. I was, for nearly twenty years, and during the time I held the situation, the first procedure was to make them translate two or three sentences, *ad aperturam libri*, of Gregory's Conspectus, or Celsus, and then to write it down upon a piece of paper, to see if they could construe and spell; then they were to translate some prescriptions in the Pharmacopœia, and were examined upon the composition and uses, and doses of medicine. If they failed in Latin and English, they were remitted to their studies. The next Examinator took the candidate up on Anatomy; the third went to Surgery; and if there was any doubt upon the minds of any of them, the fourth examined him generally. The examinations lasted from twenty-five minutes to an hour sometimes, but not very often, because they were examined shortly on a great variety of subjects.

Do you consider a *vivâ voce* examination in English preferable to one conducted by questions proposed entirely in Latin?—I think a mixed examination better than either one or the other. It were better to let them write down something; for example, desire them to write a prescription of their own for a particular purpose, and translate a few sentences from a Latin author. In my time, Greek was not attended to; it was not made imperative.

It is not now required by the College of Surgeons?—It is recommended.

Is there no examination upon it?—I believe the examinators sometimes bring in a sentence where there is a Greek quotation, to see whether the student can read or write it; but I am not quite certain as to that.

Are you aware whether it has ever happened, that individuals have been remitted to their studies by the College of Surgeons, who had previously obtained the degree of Doctor of Medicine, or after passing the examination for that degree?—Yes, but not very often; if I am not mistaken, I think I have known two or three instances after they were M.D., but I could not condescend upon things which took place so many years ago.

In those instances, did you understand they had failed in examinations before the College of Surgeons on points purely surgical, and as to which it might be supposed that the exami-

University of Edinburgh.

George Bell, Esq., Surgeon.

11 December 1826.

nations by the Medical Faculty had not been so minute, or was it in regard to the general branches of Medicine?—I cannot say that I have any recollection of the particulars.

Have you any means of knowing whether the reverse has happened, namely, that those who had Diplomas from your College, have been remitted to their studies, when examined for their degree of Doctor of Medicine?—I have no means of knowing; but supposing it were to happen on both sides, it is quite obvious how it can be explained. Some may be rejected by the Medical Faculty, who have passed our examinations, for they examine in Latin; now the students who pass at Surgeons' Hall, do not generally study under a Grinder for the purpose of enabling them to speak Medical Latin, although they are expected to be able to construe Medical Latin, particularly Classical Medical Latin fluently, such as Celsus, and Gregory's Conspectus. On the other hand, those who have been passed by the Medical Faculty in the University, may be rejected at Surgeons' Hall, for they are often examined on a variety of Chirurgical subjects, which may not be treated on by the Medical Faculty in the University. As to the system of Grinders, many of them are gentlemen of very considerable talents and acquirements. I was very intimate with Mr. Candlish, who was a judicious man, and an excellent teacher. He took great pains, not only to instruct his pupils in the phraseology of Medical Latin, but gave them excellent lessons on the subjects on which they might probably be examined. For example, he had a great variety of titles, such as Asthma, Consumption, Apoplexy, &c., drawn up in the shape of such questions and answers, as good sense and a knowledge of the subject might lead a judicious person to suppose might constitute the manner in which the examination would be conducted. These titles he gave them to read, or to get by heart, and then examined them and conversed with them on the subject. With this mode of drilling, for two or three months or more, they go in, and it is difficult for the examinators to ascertain whether they have obtained the information by rote in a brief period, or have acquired it in the general course of their studies; and if they have a good memory, they get on very well. I have often heard Dr. Gregory say, that Candlish assured him, he could tell pretty accurately beforehand, whether the student would pass, who had been put through this mode of discipline.

Is it really understood in practice, that these Grinders do enable young men to pass, when they would not otherwise be able to do?—There is little doubt of this being so formerly; that was Dr. Gregory's opinion. Mr. Candlish told him, as he told myself, that he frequently said to a young man, "You had better not go in, you will not pass;" and he found he was very rarely deceived. I do not know whether this system goes on now precisely in the same way; there are many clever men among these teachers. I believe they have classes, eight or ten students in each, during the whole winter; and they read all the best Medical Classics in Latin, explain them, and give lectures upon them.

Is there any thing you would be inclined to suggest, as an improvement in the mode of examination, such as dividing it according to the different classes the students have been attending, during the first year of their studies, and then during the second year?—I think every student should be examined before he enters the Medical classes at all, to ascertain that he is in a situation capable of deriving due benefit from these classes. I would say, that at the end of every session each student should be examined, to ascertain the extent of the progress he has made, so as to show that the Professors have been attended to and understood. I have heard it repeatedly—though I do not know it myself personally—that students have come down from London and taken their tickets; and in the course of a few days they have advanced again, and taken tickets under another name, the Professors could not know them. In the course of a few days, other tickets were taken by the same person, from other Professors, for one not then studying at the University, but living as practitioners in London or elsewhere, and only wanting to obtain the certificates of the Edinburgh Professors; so that, not having had a full regular academical education previously, they may be enabled to take their degree here, or at some other University, in due time. That is less practicable now, I believe, because they have to insert their names repeatedly in an album, in the course of the winter. That is one reason why I would suggest the necessity of calling the roll, to render it as difficult as possible for any scheme of this kind to be practised. I believe that, even as it is, a student might go to the Librarian and put down the name, and he would not know him again, so large a number of students having to pass without check under his review.

You mean that one person may represent another?—Yes.

Have examinations ever been introduced into the Class of Surgery, under the superintendence of the College of Surgeons?—Yes, by the former incumbent—I believe the present one does it also; there was always an examination on a Saturday, that is, once in the week.

Were those imperative on all the students?—They were not imperative, but they were numerously attended, I understand.

Do you know if, at present, attendance upon them is considered a hardship by the students, or as a privilege?—It is reckoned as a privilege by really zealous students—by those who wish to excel. It ought to have been imperative. I ought to mention, that for these examinations, each student paid 5*s.*, which sum was expended in the formation of a Class Library, for the use of those students who attended the examinations.

Are there any other points, relating to the subject, upon which it has occurred to you to make any observations?—If it were possible to introduce those private teachers whom I have spoken of into any situation, or accredit them as tutors for students, I think they would be of great use.

Do you mean that they might be allowed to superintend the private studies of the young men?—Yes; their number would increase, if they were accredited by the University as tutors, as is done, I believe, at Oxford and Cambridge. It would be of great use to those who are not apprentices, or who have not served an apprenticeship to a general practitioner.

University of Edinburgh.

George Bell, Esq., Surgeon.

11 December 1826.

Would you render it imperative that all Medical Students should enrol themselve with one or other of these private teachers; or in what way would you propose that this alteration should be effected?—It is very difficult to say. I believe, the less you attempt to enforce these things, the better. But a strong recommendation to the students to avail themselves of the assistance of these gentlemen, would have a good effect.

Do you understand, that a great proportion of students intending to graduate, do avail themselves of the assistance of these teachers?—I understand, a great many do.

What do you understand to be about the average expense of a student of Medicine in Edinburgh, living in lodgings, whose means are circumscribed, and who is obliged to live economically?—It depends upon their rank in life. A few poor lads from the country, who have no friends or relations to support them, can manage it, I believe, for somewhere about £35 a-year for board and lodging, during nine months; but it requires great economy. The richer students board and lodge comfortably for £60 or £70 per annum.

Does that include their classes?—No; it is exclusive of them.

Will not the average expense of the classes each year be about £15?—I think, at least, that probably £20 will be requisite to take them into the Infirmary, and to fee the other classes. There is a great fault in their attending too many classes at one time, and crowding too many things together.

Does it occur to you that the subjects of the present classes are too extensive to be embraced in a course of six months?—Yes; I rather think the class of Practice of Physic is so, and the Anatomical class as it is now constituted. If the Professor of Anatomy were to give a six months' course upon pure Anatomy, without mixing it with Surgery, it would be an improvement.

You have alluded to a class of Practical Chemistry; in what way would you propose that that should be taught in the College?—I think it might be done in the College; but Chemistry is so very extensive a subject, that if the Professor had an assistant, he might give a course, or it might be left open to be taught by private teachers. The Professor's Assistant would possess great advantages from having the use of a most valuable apparatus. But there are most excellent private teachers, one of whom was the Professor's Assistant for some years; he gives lectures on Practical Pharmacy and Practical Chemistry.

Are there any other matters upon which you have to offer any observations?—Perhaps I ought to mention, that although the practice in differents parts of Scotland is confined very much to those who have studied here and in Glasgow, having diplomas, yet many have no diplomas. There is no authority that I know of, to enforce the possession of a diploma in any of the Colleges, except Glasgow and Edinburgh; and it is only over a very small part of Scotland that the monopoly of these Colleges extends. So that in every county north of the Forth, irregular practitioners may do whatever they please. Our jurisdiction extends over the three Lothians, Berwick, Roxburgh, Peebles, and Selkirk; but we have no authority over Dumfriesshire nor Wigtonshire.

Does the College of Surgeons of Edinburgh enforce its monopoly within the territory over which it is supposed to extend?—It does not, the law is so difficult of application. I remember, on one occasion, the medical people in Berwickshire applied to the College of Surgeons, to protect them against a Dunse Doctor; they prosecuted him, and got him banished the county for a year and a day, but he returned at the expiry of the term.

Is it not a fact, that a great number of persons practise in Edinburgh without any diploma at all?—Yes, no doubt of that; but I am not aware of any one having been prevented practising—at least it has not happened in my time.

You have alluded to the Class of Medical Jurisprudence as one which you thought valuable; is it your opinion that the subjects of that class are sufficiently taught by the other Professors so as to render it unnecessary, or do you consider it to be a valuable addition to the University?—I would say, from what I found when I was there myself, as well as from what I have been able to collect since, that there are many of its subjects which are and must be treated of by different Professors. For example, the Professor of Chemistry must treat of the mode of detecting mineral poisons, such as arsenic, corrosive sublimate, and others; Dr. Black was at great pains about that; he gave several lectures, and exhibited various experiments to show the means by which they might be detected. The Professor of Anatomy must do the same, with regard to the subject of suspended animation, and many others. The Professor of Midwifery must instruct the students how children put to death after birth may be distinguished from those who are still-born. But it is a subject of so much importance, and it is possible to convey so much additional information to the students by a separate course, besides being a vehicle for recapitulating all that they have formerly heard, and attracting their attention to it by putting it in a more scientific form, that it ought, in my opinion, to be made imperative. The lectures of Dr. Duncan, senior, who first introduced lectures on this subject into this University, although they were limited to a very small number, contained a great deal of useful information, and they attracted the attention of the students. It was not an imperative class, but voluntary; it has never been so well attended, from not being protected. A student does not like to spend money for classes, unless he is very enthusiastic in the pursuit of professional information.

Are there any further observations, upon points connected with the interests of the Medical Science, that you feel desirous of making?—Perhaps it is wrong for me to say anything upon the subject of Private Lecturers, but it is only in the way of suggestion that I would offer it. As various subjects which can scarcely be taught, at least to any great extent, in the University, such as Practical Anatomy, and even some branches which are taught in the University, are also well taught by private teachers, perhaps it would not be injurious to the interests of the University, if it were to reciprocate a little, and to allow the students to receive a second course of these last from the private teachers.

University of Edinburgh.

George Bell, Esq., Surgeon.

11 December 1826.

Do you understand, in point of fact, that a great number of young men who graduate in Medicine in this University do attend many of the classes twice, either in the University, or with private teachers?—I believe a number do attend twice, at least I have a few apprentices, and I make most of them attend some of the classes twice during their course of study. I make them attend the Class of Chemistry twice in the University, always during their first year, and generally during the third or fourth. I make them attend Clinical Lectures twice, and a class of Anatomy three times, dividing these between the University and private lecturers, according as their other occupations can be made to suit the hours of the different classes.

Supposing the University were to enjoin attendance upon some of the classes in the Curriculum oftener than once, either in the University of Edinburgh, or at private established lectures, do you conceive it would be requiring more study than, in point of fact, the greater proportion of the students at present follow?—Not more than what is followed by a number of the students already.

Do you consider that all the young men who are directed by their masters, if they happen to be apprentices, or by their friends, who have the charge of their medical education, do attend certain classes in general twice?—Those who I recommend do it generally—I suspect not always.

Do you know, whether to apprentices and others, who in any degree are under the charge of medical friends or advisers, the recommendation is given to attend the classes?—It is by me. I always desire every one of my apprentices to attend every Medical class in the University. Sometimes, boys will not do what they are desired, but will make their friends believe they do it. I always desire them, and give them lists every year of the Medical Professors and private Lecturers whom I wish them to attend, so that at a future period, if they wish it, they may be qualified, so far as having attended all the University classes required by the Curriculum, to graduate. Besides these, I make them attend several of the private lecturers, especially on Practical Anatomy, Practical Chemistry, and Pharmacy.

Are there any further observations which occur to you to make upon the subject?—I have none.

Edinburgh, Tuesday, 23 *January* 1827.

The Right Honourable the LORD ADVOCATE in the Chair.

Dr. *John Thomson,* Fellow of the Royal College of Surgeons, and Licentiate of the College of Physicians, called in and examined.

Dr. John Thomson.

23 January 1827.

Were you at one time Professor of Military Surgery in the University of Edinburgh?—Yes.

For how many years?—About fourteen.

Have you any suggestions to offer to the Commissioners on the subject of Medical education?—I have several, which I should like to have an opportunity of stating to the Commissioners.

Will you have the goodness to favour the Commissioners with your views as to the previous education of Medical Students?—I have taken the liberty to put down in writing what has occurred to me upon that subject; and with the permission of the Commissioners I shall read it from my notes, and shall afterwards be ready to answer any questions that may be put to me. I beg leave to state that I have reduced the different topics connected with Medical education, which I am desirous to bring under the review of the Commissioners, under ten separate heads. They are the following:—1*st.* The Improvement of the Literary and Scientific Education of Candidates for Medical Degrees. 2*d.* Instruction by Examinations, as well as by Lectures; and an Annual Examination of the Candidates for Graduation, by the Members of the Medical Faculty. 3*d.* Examinations conducted, and Theses written in the English language. 4*th.* Each Professor to be provided with a Text-book for his Course, containing a Statement of the General Principles of the Science which he teaches, with references to the latest and best sources of information. 5*th.* The Extension of the Summer Courses to the same length with the Winter Courses, and the Extension of some of the Winter Courses. 6*th.* The Division of the Theory or Institutions of Medicine into two distinct Courses of Lectures, the one on Physiology and the other on Pathology. 7*th.* Surgery separated from Anatomy and taught by a Practical Surgeon. 8*th.* The Establishment of a separate Professorship of Clinical Medicine. 9*th.* A regular Course of Medical Study to be prescribed. 10*th.* Some Provision for the Retirement of those Members of the Medical Faculty who may become unfit for the proper discharge of their duties. It is upon these topics I should like to offer to the Commissioners a few remarks:—*First.* The Improvement of the Literary and Scientific Education of Candidates for Medical degrees might, I think, be effected, by requiring of young men entering on the study of Medicine, with the intention of graduating, that they shall have received a proper preliminary education, consisting of a competent knowledge of the Greek and Latin languages, and of the elementary parts of Mathematics; by making Natural Philosophy a necessary branch of the education of candidates for Medical degrees; and by encouraging them to study other branches of liberal education, such as Logic and Moral Philosophy, either previously or subsequently to their entering on their Medical studies. The importance of these elementary branches of education to students of Medicine arises, I conceive, not only from the tendency which their cultivation has to open, enlarge, and strengthen the understanding, but also from a competent knowledge of them being absolutely necessary to enable students to comprehend readily those lectures and books through which their professional information must be obtained. A very considerable portion of the Terminology of Medicine, and of its auxiliary sciences, is of Greek derivation, a fact of which any one may easily satisfy himself by consulting a dictionary of Medical terms. In many instances a very accu-

University of Edinburgh.

Dr. John Thomson.

23 January 1827.

rate notion of the scientific meaning of the terms is conveyed in their primitive signification; in other instances the terms convey ideas important to be remembered, and well calculated, if understood, to fix them in the mind of the student. Other terms, indeed, may be expressive of opinions that have been found to be erroneous since they were invented; but even of these a physician ought, certainly, to understand the primitive signification. And in all cases, I am persuaded, the labour of the student must be prodigiously increased, if he is obliged to carry on the study of the Etymology of the terms used in Medicine, at the same time that he is employed in acquiring a knowledge of the principles of that science. I need only refer to the Nomenclatures of Anatomy, Chemistry, Natural History, and Botany, and to all the late works that have been published on Nosology, and on the Practice of Physic, in this country, France, Italy, Germany, and America, for proofs that, so far from the use of the Greek language having become less necessary for students of Medicine than formerly, new Greek terms are every day framed to correct and to complete the nomenclature of these sciences. Indeed it is well known that whenever there is occasion, at the present day, for a new term to denote any invention in the Arts, or discovery in the Sciences, the Greek language is universally employed for that purpose; and in no department of knowledge has it ever been employed to so great an extent as in Medicine and its accessory branches. With regard to the importance of a knowledge of the Elementary parts of Mathematics and of Natural Philosophy to students of Medicine, I shall only remark that, waving altogether the consideration of the advantages of the habits of attention and of accurate reasoning, which the study of these sciences has a tendency to engender, there is no branch of Medicine to which a knowledge of them is not applicable. There can, for example, be no accurate Anatomical description given of any part of the human body, without employing the language and principles of Geometry; and there can be no proper account given, I conceive, nor notion formed, of the exercise of the functions of the living body, in the states of health and disease, unless by those who add an acquaintance with the principles of Natural Philosophy to a knowledge of Anatomy and Chemistry. It would be easy to show, by a reference to the latest and best Elements of Physiology that have been published on the continent of Europe, as those of Magendie, Adelon, and Richerand, in France, and of Sprengel, Rudolphi, and Lenhosseck, in Germany, not only that these are the opinions entertained by the authors of these works, but that it is impossible to understand many parts of their writings without some acquaintance with the Physical Sciences. I am far, however, from thinking that it should be required of Medical graduates that they should be profound scholars, or deeply versed in Mathematics, Natural Philosophy, or Metaphysics; but I entertain no doubt whatever that they who have previously gone through the mental discipline necessary for acquiring a competent knowledge of these branches of education, must enter on their Medical studies, and pursue them with their minds infinitely better prepared for acquiring Professional knowledge than those who have not received such a preparatory education. The degree of preliminary knowledge in Latin, Greek, and Mathematics, which I conceive to be necessary for Students of Medicine, can be easily attained, I believe, in every part of these kingdoms; and the time of students, I am convinced, would be much more profitably employed in acquiring some knowledge of these branches, than in serving, as many of them do, long, useless, and expensive apprenticeships in the performance of mechanical and menial services. My opinion respecting the necessity and importance of a proper preliminary education for Medical students, extends to those educated for all the departments of the Medical profession, but more especially to those who are to practise as Physicians; and hence it appears to me to be peculiarly incumbent on the Universities to take the lead in a reformation, which must soon, in the present widely diffused taste for general information, be adopted by all the public bodies in this country that possess the power of licensing Medical Practitioners. Indeed I cannot but think that there is something extremely incongruous, to say the least of it, in the Professors of Letters, of the Sciences and Philosophy, in any University, joining with the Medical Professors in granting the highest honours in Medicine to individuals, of whose literary and scientific attainments no test has been required. And, even independently of the necessity which exists, from the nature of their professional studies, that Doctors of Medicine should be men of good education, it seems to me obvious, that if this University shall continue to be satisfied with their graduates possessing a smattering of Latin, at present the whole amount of preliminary qualification which they require, whilst other Universities exact of their graduates an extensive course of literary and scientific education, the respectability of an Edinburgh degree, and the reputation of the University, must necessarily sink very much in public estimation. On the subject of Preliminary Education, I may be permitted to add, that during a great deal of intercourse with Medical men, I have never heard a single individual express the smallest doubt with regard to the propriety and advantages of students of Medicine being obliged to receive such an education. I have heard many regret that their attention had not been sufficiently directed to studies of this nature, by their parents or guardians, at an early period of their lives; and several have confessed to me that, with the strongest inclination to make up for the deficiencies of their early education, they had found this a much more difficult task than to acquire professional knowledge. To their testimony on this point I can, with much sincerity, add that of my own experience.

Does your knowledge of the circumstances of any considerable proportion of the students of Medicine lead you to believe, that if such Preliminary Education were required, it would operate as a hardship upon them?—I do not think it would, if this education were properly pointed out to them. If it were previously known that they must go through any given course of preliminary education, I believe, on the whole, there would be a great saving of expense to Medical students; for the allowing students to come up to the University, without their parents or themselves being aware of the previous education that is necessary for qualifying them to enter upon the study of the Medical Profession, frequently occasions a great loss of time and a considerable additional expense.

Do you think that none would be excluded from the Medical profession, in consequence of being unable to defray the expense of that early education?—I do not think there would; and, if there were, I am quite sure they would be individuals who ought not to be permitted to enter it. I am informed that in Ireland, where the lowest grade in the profession may be considered to be that of an apprentice to an apothecary, no one is permitted to enter into an indenture with an apothecary until he goes up to Dublin, and is examined upon his knowledge of both Latin and Greek. I have been told, also, that no young man can be bound as an apprentice to a surgeon in Dublin, until he has been examined as to his knowledge of Greek as well as Latin; and the same qualification is now required of individuals, who are to receive Medical degrees, from several of the Universities in this country.

Is it one of your reasons for wishing students to have a knowledge of Greek, that many of the terms used in Medicine are derived from that source?—Yes.

Have not many of those terms been perverted of late from their original and literal signification?—Some of them have been; but as Greek terms occur perpetually in medical writings, as there is no medical book without them, as every new book on Nosology and the Practice of Physic contains more of them than the works by which they were preceded, and as every discovery that has been made in Pathology during the last fifty years, has given rise to the invention of new Greek terms, the only question with regard to this point seems to me to be, whether those who are obliged to read such books, containing nothing but Greek terms, should understand the meaning of those terms or not.

Are Medical men in use to read Greek?—Many Medical men do not read Greek so much as they ought to do, and that I conceive is the reason why they should be obliged to be able to read it. They have certainly a great deal more occasion for a knowledge of the Greek language than men belonging to any of the other learned professions. It is well known that in this country a certain knowledge of Greek is required, not only of Clergymen of the Established Church, but of different classes of Dissenting Ministers, before they are permitted to preach; yet I suppose many of them come from a class of society not wealthier than that from which students of Medicine are taken. Indeed, all students of Divinity in Scotland, whether belonging to the Established Chuch or to the Dissenters, are obliged to have received an University education of four years' duration, before they are permitted to enter on their Theological studies.

Is it your opinion, then, that after it becomes generally known that a knowledge of Greek is necessary, it could be acquired by students of Medicine, in their course of preliminary education, without material hardship?—It is my opinion; and it would, I conceive, confer the greatest possible benefit upon students of Medicine and their relations, to point out distinctly to them the branches of preliminary knowledge that are requisite for enabling them to enter with advantage on the study of Medicine. I have no doubt that, if this were done, after two or three years every young man who came to the University would be prepared with those preliminary branches of knowledge which had been declared to be requisite.

Do you at all apprehend that the result of any such change as you have been recommending would be, that a greater proportion of persons would practise without a degree?—I do not think it would. From all the experience I have had with regard to that point, and particularly from the opportunities of observation which I have had, as a Member of the College of Surgeons, it has appeared to me that the desire to have a diploma has always increased in proportion to the difficulty of obtaining it. When I say the difficulty of obtaining it, I mean the increased qualifications required of those on whom it is conferred, and the consequently increased expense.

Is there no risk, in the event of the change alluded to, of the Medical practice going into the hands of those who have no diploma at all?—On the contrary, I am persuaded that the only way to restore Medical practice into the hands of well-educated persons (for a great part of it has already passed out of their hands) is by raising the preliminary and professional qualifications of those who obtain licences to practise, to fix a distinct barrier between those who are educated for the Medical profession and those who enter on the practice of it without having had that advantage.

Do you think there would be no greater proportion who will practise, in case of such a change, without a degree or diploma, than there will always be of quacks under all circumstances?—I think it would diminish the number of uneducated Medical practitioners. At present there is, in this country, no well-marked line of distinction drawn between those who have received an education, sufficiently extensive, and those who have received little, if any education at all; and I believe it is the same with regard to the state of Medical practice in England.

Is it not the case in England, that a great part of the Medical practice is in the hands of the Apothecaries, who have no Medical degree of any sort?—The greater part of the Medical practice, beyond seven miles from London, and also a large portion of the practice in London itself, and the district immediately around it, is in the hands of Apothecaries, for whose proper education a very inadequate provision has been made by the Legislature and by the Society of Apothecaries.

Then, so far as England is concerned, the object would naturally appear to be, would it not, to increase the number of graduates, rather than to throw obstructions in the way of obtaining degrees?—I think so. I have no doubt the number of graduates would be increased in proportion to the increased respectability of the Medical degree, and that if parents, who are going to breed their children up to the Medical profession, were made acquainted with the necessary qualifications for obtaining degrees, a better prepared class of students would go to the Universities to take them than do at present. They would be better educated and more respectable in every way.

Are the Commissioners to understand that your notion is, the greater the value and esti-

University of Edinburgh.

Dr. John Thomson.

23 January 1827.

mation in which degrees are held by the public, the greater number there would be of those who would take them?—I think this would happen the moment a proper line of distinction is made by the Legislature between well-educated Medical men and illiterate pretenders. At present there is none, or at least very little.

Is a knowledge of the Greek language required of Medical students by any of the public bodies in this kingdom?—It has long, perhaps I should say always, been required by the Universities of Oxford and Cambridge, on the part of medical men; and it is now required by the Universities of Aberdeen and St. Andrew's.

Is it required by the Army Medical Board?—Yes. From a very late communication with which I have been favoured by Sir James M'Grigor, it appears that a knowledge of the Greek language is, by the last regulations, declared to be indispensable for young men wishing to enter into the Medical service of the Army.

Do you consider a knowledge of the French language to be of importance to students of Medicine?—Quite indispensable. There are at present a great number of valuable Medical works published in France, particularly on Anatomy, Pathology, and Diseases. I hold a knowledge of the French language to be an indispensable requisite for students of Medicine.

Do you know if Sir James M'Grigor was consulted with regard to the regulations which have been published by the Marischal College, Aberdeen, of which he is Rector?—Yes, I believe it was chiefly through Sir James's influence that those regulations were adopted; in fact I know that he took particular pains to get them adopted, and I know he is very anxious that the other Universities in Scotland should be obliged to adopt similar regulations.

With regard to Natural Philosophy, from the account you have given just now, it appears that you do not require a very profound knowledge of Natural Philosophy; do you think there can be any great benefit derived from a mere smattering?—I believe that at present, in several Universities on the Continent, and particularly in France, there are two courses of Natural Philosophy given. One of these, (which is called the experimental course, such as that which the late Mr. Ferguson was accustomed to give in all parts of this country,) conducted with a view to the practical instruction of Medical men, and the other a course for men of science, in which the principles of Natural Philosophy are more rigorously demonstrated, by the application to them of Algebra and Geometry. The last is what I should regard as the proper course for Medical men, for I hold that there is a very great difference between a course of lectures on Natural Philosophy, where the teacher has recourse to the ordinary principles of Algebra and Geometry, and one into which much of the fluxionary Calculus is introduced. I know that in this University the late distinguished Professor Robison introduced the fluxionary Calculus into his course of lectures, which put his demonstrations frequently beyond the comprehension of all, except a very small number of his audience; but that is not the kind of course on Natural Philosophy which I conceive to be desirable for students of Medicine.

Do you not think that a considerable knowledge of Natural Philosophy is necessary, if not directly for the improvement of Medical Science, at least for the purpose of enabling a Medical man to refute absurd hypotheses, and likewise to expose the inutility of Empyrical practice?—There are various branches of Medical knowledge, which I conceive cannot be understood without a knowledge of the different branches of Natural Philosophy. Thus, everything relating to Muscular Motion requires a knowledge of Mechanics; everything relating to Vision requires a knowledge of Optics; everything relating to the Circulation of the Blood requires a knowledge of the common principles of Hydraulics. I conceive that there is no branch of knowledge, the introduction of which into the education of Medical men, is better calculated to prevent the adoption of useless, futile, and erroneous theories, than that of Natural Philosophy. It was at one time the pride of Medical men, to be profound Mathematicians and good Natural Philosophers; but the popularity which the Science of Chemistry has attained, has thrown other branches of knowledge far into the background. The consequence of this has been, that for the last forty years, it has seldom, if ever, in Medical reasoning, proved the slightest hinderance to the adoption of a Medical theory, that it involved a *physical* impossibility, or was incapable of having applied to it the stricter methods of reasoning used in Geometry and Algebra.

Do you think Borelli *De Motu Animalium* is a good book for students?—It is a good book, but it is not sufficiently elementary for students. The ingenious and very learned work on the same subject, by the late Dr. Barclay of this place, seems to me to be liable to the same objection.

Will you have the goodness to proceed to state any further observations you have to offer?—The *second* change I would propose on the system of Medical Education at present pursued in this University is the enforcement of the system of instruction by Examinations as well as by Lectures; and the institution of an Annual Examination of the Candidates for Graduation by the Members of the Medical Faculty. The practice of holding daily or weekly Examinations of the students on the subjects treated of in the lectures of the day or week, I consider, from some experience in it, to be highly beneficial to the pupils, and nearly equally so to the teacher—to constitute, indeed, the most useful and instructive species of intercourse that can subsist between them. This practice, which was followed for many years in this University by Dr. Cullen, has been adopted, I understand, by the present Professor of the Practice of Physic, and by the Professor of Anatomy, and requires only to be made general, in order to evince the advantages that may be derived from it. The method of instruction by Examination, superadded to that by Lecture, might, in some measure, I conceive, be made to combine the advantages of an English with those of a Scotch University Education; for when I recommend the general introduction of Examinations into the different Medical Classes taught in the University, I of course understand that they should be superadded to, and not hold the

University of Edinburgh.

Dr. John Thomson.

23 January 1827.

place of, the Lectures at present delivered. I conceive that an Annual Examination by the Medical Faculty, of those intending to graduate, would keep their attention alive to their studies, during the earlier as well as the later years of their attendance at the University. If certain additional Professorships, which I conceive to be necessary, were added to the Medical Faculty, these Examinations might easily be conducted by a Committee of three of their number for each class. The last Examination might, as at present, be conducted in the presence of the whole members of the Medical Faculty; and, while this Examination would necessarily relate chiefly to the Practice of Medicine, it might embrace, in more or less detail, all the other branches of Medical Education. The Medical Teachers denominated Grinders in this school, are in reality private tutors, whose unrecognised tuition is carried on chiefly in the way of examination of the students. The practice is excellent in itself, and it has become a subject of derision only in consequence of the use to which it has too frequently been perverted, namely, that of preparing, in three or four months, idle and ignorant students to undergo their Examination for Graduation. If, instead of one general examination at the conclusion of their studies, candidates for degrees were obliged to undergo an Annual Examination, the great evil of the present system of grinding, that of encouraging students to be idle till near the conclusion of their course of studies, would be done away with, and the Examinations of the Grinders, supposing their assistance to be necessary, would proceed *pari passu* with the instructions of the Professors. Contracted as the examinations of the Grinders at present are, into three or four months at the end of the last winter session, they, in a great number of instances, put an effectual stop to the attendance of candidates for degrees on their University Classes, and consequently interfere very seriously with their other Medical studies. I am not disposed to believe, that the practice of the Professors holding regular Examinations of their pupils would prevent those intending to graduate from availing themselves of the assistance of the Grinders. Those who, either from inattention, from ill health, or other necessary causes of absence from lectures, have not been able to profit adequately by the instruction of their Professors, will be glad to benefit by the tuition of the Grinders. And besides, it can be only in small classes, such as those formed by the Grinders, that young men can acquire that certainty of being acquainted with the branches in which they are to be examined, and that readiness in framing their answers, which those who are to undergo trials for a degree must be desirous to possess. If Philosophical, Scientific, and Literary degrees were made objects of ambition to the young men of this country, I think one of the most beneficial effects that would result, would be the encouragement to grinding in the other departments of knowledge besides Medicine. That there should be no demand in this University for private tutors in Logic, in Moral and in Natural Philosophy, must be considered, I conceive, as a proof that the importance of these sciences in general education, as well as in professional, is still far from being properly estimated. The Annual Examinations would diminish the number of final rejections of Candidates for degrees, without, in many instances, retarding the progress of the young men, or sacrificing to compassion for them the interests of the public. It is understood that, at present, the period for which young men, found unqualified to pass, may be remitted to their studies, is indefinite. It may be either for an additional session, or merely for a few weeks. After this shorter period, by dint of hard working with the Grinders, they may undoubtedly re-appear, better qualified to answer the questions put to them, but certainly not *bonâ fide* more deserving of receiving a Medical degree. A young man, found ignorant of any particular branch of professional knowledge at his annual examination, might be enjoined to add the study of that branch in the University to his next year's classes.

Are the Commissioners to understand that you approve of a properly regulated system of Private Tutors?—Certainly. If the system of grinding were acknowledged, and properly regulated, I think nothing could tend more to promote the education of Medical students at this University. But it should be open and avowed; and it should be recommended in public to young men, whose education is in any way defective, to attend private tutors, and to avail themselves of all the information they can derive from them.

Is there anything further you have to suggest as an improvement in education, by the system of having private tutors?—No. I think good might result from the Commission approving of the existence of such a body of men; for though they exist at present, their existence is not acknowledged.

Do you think attendance upon private tutors should be compulsory, or should it be left entirely to the choice of the students themselves?—It is not a subject, in fact, that I have studied; but I would be inclined to leave it very much to the young men to make choice of a private tutor, who, they learnt from their companions, was the person from whose instructions they were likely to derive most advantage.

Do you think that it should be compulsory on them to employ any private tutor?—No, not at all. I think that private tuition may be the means of assisting and promoting the studies of those whose education has been retarded by ill health or other circumstances. Young men who come up here, are often confined to their rooms by indisposition for a great part of the winter; and it is hard they should be put back in the course of their studies, when, perhaps, they are employed at home, if health permits, and study their profession as diligently as they can for a time from books, instead of lectures.

Do you happen to know that Dr. Cullen was in the habit of examining his class?—Yes; I have a document in my possession which proves that. Dr. Cullen was, I believe, the first who began this practice in the Medical School of Edinburgh. What I am going to read, is a letter to Dr. Cullen from the gentlemen who attended his Examination Class in 1781-82. It is dated Edinburgh, March 1782, and is as follows:—

"Sir,—Permit us to express the grateful sense which we have of your goodness, in meeting with us at five of the evening, amidst your various and important avocations. You have generously dedi-

University of Edinburgh.

Dr. John Thomson.

23 January 1827.

cated to our improvement those valuable hours which, as usual, you would otherwise have employed in promoting the health of mankind, and in enlarging the boundaries of Science, and of the Medical Art. With a familiarity which endears you to us as a man, with an acuteness which characterizes the philosopher, you have explained to us those important doctrines which ought to be the guides of our future years. We perhaps shall soon visit the most distant quarters of the globe, but we trust that neither distance of time nor place shall ever erase from our memories the high obligations which we lie under to our disinterested and illustrious Professor. Sir, we have the honour to be, with the highest respect, your very obedient and obliged servants."

I may mention, as showing the value which students themselves attach to Examinations, that I received, in the year 1809, a letter from my own students, thanking me for holding weekly Examinations.

Was it in the course of your general duty, as Professor to the College of Surgeons, that you commenced the practice of examining your students?—I think it was before I was appointed Professor that I began to hold examinations on the Saturdays. I instituted a Class Library, and those who attended the examinations paid 5*s.* to this class library, for which they had the liberty of reading the books. I put in a certain number myself, and the same practice has been continued by my successor in the Chair of Professor to the College of Surgeons.

What proportion of the students attending your class attended those examinations?—A very considerable proportion of the students, who were going to take out their Diplomas, attended. In fact, I may say I was forced into the practice of holding public examinations, for a considerable number of my pupils came to me to ask it as a favour that I would examine them privately; and I found it quite impossible to accomplish this on account of their numbers.

Was it at a separate hour from your hour of Lecture that you examined?—I examined upon the Saturdays, at the ordinary hour of Lecture; but when, towards the end of the session, I found that I had not overtaken all the subjects of my course, I occasionally took another hour. From that letter to Dr. Cullen, which I have read, it is evident that he examined at a separate hour,—in fact, that he went out at five o'clock after dinner to examine his class.

Do you conceive that there is any difficulty as to examinations, from the want of hours?—An hour, according to my opinion, is at all times much better employed in examination than in Lecture.

Do you think that one hour a-week will generally answer the purpose?—There are some courses of Lectures in which, I think, the Professors might include the whole of the questions that would require to be put on the subjects treated of in the course of the week, in one hour's examination. There are other subjects, for which I think it would be better that, besides Saturday, a day should be devoted to examination in the middle of the week, so that there might be an examination every third day. I speak of the Medical Classes entirely.

From your knowledge, having been a Professor of this University, do you think that generally there is such a difficulty arising from the want of hours, as could present a formidable obstacle to an arrangement for general examination?—No; I am sure that one Medical Professor might be examining one class, whilst another Professor was lecturing to another class, without any inconvenience. It is no objection to a Professor's holding an examination at any particular hour, that another Professor happens to lecture at the same hour, whose lectures the students of the first Professor are not sufficiently far advanced to attend, or ought previously to have attended. I think the hours destined to Medical Professors cannot be better employed than in examination.

Are any hours employed in the morning, in the University of Edinburgh?—The first is at eight, the second at nine, and they go on after that regularly. There is one open hour, but no medical teacher, either Professor or Lecturer, has occupied it; it is from twelve to one, which is the Infirmary hour.

Is it your notion that the course and plan of Medical Studies should be regulated, in regard to the distribution and attendance on classes, with reference solely to the object of Medical study, assuming that the preparatory education had been previously acquired?—Yes.

Is it not generally understood to be the practice of Medical students at this University, to attend too many classes at the same time?—A great deal too many. I think the system of examination would check that more than anything; it would oblige them to fix their attention upon the proper subjects of their studies.

Will you proceed to the next topic on which you have any observations to offer to the Commissioners?—3*d*, As to examinations conducted and Theses written in the English language, there can be little doubt that the extent of the professional qualifications of candidates for Medical degrees will be best ascertained by their being examined in the language most familiar to them and to their examiners. The only reason which has ever been alleged in favour of the examination in Latin is, that it ensures some knowledge of that language on the part of Graduates. It is a matter of notoriety, however, in this Medical School, that the manner in which a student undergoes his University examinations is a very inadequate test of his knowledge of Latin; for very good classical scholars often find the necessity of speaking Latin, upon these occasions, a more serious inconvenience than those do whose chief knowledge of the language has been acquired for the purpose of enabling them to pass through their examinations. It seems to me, therefore, that the requiring the candidate to translate a portion of some Latin author, either orally or in writing, would afford a much better test of his knowledge of that language than his being obliged to speak it. With the practice of examining in English, there might, it appears to me, be advantageously conjoined, both in the annual and in the final examinations, the mode of examination which I have been informed is followed in the trials for Literary and Medical degrees at the University of Cambridge, and at Trinity College, Dublin, as well as in several of the Continental Medical Schools, and which was formerly followed in this country, and is, I believe, still followed on

the Continent in all situations where Professorships are obtained by competition: I mean the allotting of a certain number of written questions to each candidate, and requiring of him to write out his answers to these in a situation where he cannot receive assistance. The opportunity which this mode of examination would afford of ascertaining how far the candidates for Medical degrees are capable of writing their own language correctly, would have the beneficial effect of obliging them to pay a due attention to English composition. Some of the questions might, if this were judged expedient, be put and answered in the Latin language. I am persuaded that the printing of a Thesis should be left optional with each graduate. It is only in the event of a Thesis exhibiting some proofs of research, or of talent for original observation, that its circulation in print can contribute to the reputation of the University, or to the promotion of Medical Science. I am sure it will readily be allowed, on all hands, that a very inconsiderable proportion only of the Theses printed at this University is calculated to produce either of these effects. The saving of expense to graduates that would arise from doing away with the necessity of printing a Thesis, added to that which would result from a remission of the tax on Diplomas, if this should be approved of and recommended by the Commission and granted by the Legislature, would go far to cover the additional expenses of a more extended Literary, Scientific, and Professional education. But if it should be thought expedient to continue the practice of each graduate printing a Thesis, then I am persuaded that the Thesis should be written in the English language. It is well known that, on the present system, the greater part of the Theses printed at this University are rendered into Latin by the Grinders. The money paid for this service, and for instruction in speaking a kind of Latin that can serve no purpose whatever after the day of graduation, might be laid out to much greater profit, if the Grinders were employed in teaching the students to read either the Latin or Greek Medical Classics. I believe it has been found that there is but a very short step between getting a Thesis translated into Latin and getting it wholly composed by a Grinder; and I believe, also, that a table of the Grinders' fees would show that there is no great difference in point of expense. The circumstance of a Thesis being in English would go far to secure a greater degree of care being taken in its composition, and in the study of the subject to be treated of, than are to be observed in the greater number of the Edinburgh Medical Theses. In the Universities of France and of America, the Medical graduates write their Theses in their native tongues. It used to be the custom, in several of the foreign Universities, for the Professors to write many of the Medical Dissertations, which were published under the names of the graduates, and I know not how far this practice has as yet been given up; but I feel assured that it is a practice infinitely more creditable to these Universities than that which has been long followed in this place. During the time I have resided in Edinburgh, this part of the business of graduation has been executed, I believe, in a very large proportion of cases, by the Grinders, though their labours in this department are not only unacknowledged, but contrary to the declarations demanded by the Medical Faculty of its graduates.

With reference to the subjects of examination for degrees, would you propose that they should continue private, as at present, or would you make them public examinations?—I should prefer that the annual examinations were public; but as the last is a very critical examination, where a young man's prospects in life are materially concerned, it were better, perhaps, that it should be conducted in private. I know it is impossible to have observed greater delicacy than has been done by the Medical Faculty of the University of Edinburgh, in relation to those individuals who have had the misfortune to be rejected; and as the final examination implies either admission or rejection, I would be for making that examination private, I confess; but the annual examination should be public, as it would give a great spur to the studies of young men to be called upon to give answers in public, whilst, at the same time, they would be relieved from that painful anxiety which they cannot fail to feel, when they know that their fate in life depends upon the appearance they may make.

Do you mean that there should be a power of rejection at the annual examinations?—I have proposed, that in the event of a student's not giving satisfaction by his answers upon any particular subject, he should be enjoined to attend the Lectures of the Professor of that branch in the University, for another session, so as to study over again that subject upon which he appeared to be deficient.

You do not think it advisable that there should be a power of rejecting the student, or of making the whole previous course of study go for nothing?—It would be very easy for the Professor to intimate privately to a student, who had failed in his examination, that he must either make up his deficiencies against the following year, or abandon the expectation of obtaining a degree. I do think that there ought to be a certain power lodged with the Professors, to judge of the appearance which young men make at their annual examinations; but perhaps it were better, in cases where the Professors were led to determine that a young man should be put back in his studies, that this should be communicated to him in private rather than in public.

If the annual examinations were efficient, would it not happen that rejections would be very rare at the conclusion?—I think they would be much rarer than they are at present. My own opinion is, that such a system of examinations would very much abridge the labours of the Professors and relieve them from much disagreeable and painful duty.

In that respect would it not become an object of less importance that the last examination should be private?—Yes; but unless the three first implied admission, I think that rejection at the last examination, if this were public, would bear very hard upon a young man, and upon the feelings of his relations and guardians.

Would there not be another evil which would arise from making the last examination private, that there would be no opportunity for a young man to distinguish himself from another, as to the mode in which he entered the profession?—I do not think that even if the final

University of Edinburgh.

Dr. John Thomson.

23 January 1827.

examination were to be made public, it could afford a young man much opportunity for distinguishing himself. All that is ever required of a young man, in such circumstances, is, that he shall give distinct answers to the questions put to him.

Is it your opinion that a young man of superior genius would, by means of his Thesis, have the opportunity of announcing his talents to the public?—It would be the duty of the Professors, if they saw a Thesis containing marks of talent of original observation or genius, to recommend to the young man to print and circulate it; but with regard to the greater part of the Theses that are printed here annually, they are just things which come out of the grinder's drawers. In many instances what they contain has been said 150 times before, without one single iota being added to the information of the public.

Have not many of the foreign Theses been valuable treatises?—Yes, and are so at this moment. A considerable number of valuable Theses are printed every year at the *Ecole de Médecine* at Paris, in the French language. I have seen, also, several of the American Theses, which are printed in English; and it is obvious from them that the authors are obliged to take more pains with their Theses than if they wrote them in Latin; while in the ordinary run of Theses printed here, the attention of the writers seems to be more especially directed to the Latin phraseology than to the subject-matter of their Theses.

Has it occurred that Theses printed at Edinburgh have been afterwards translated into English, and published as Medical works?—Yes.

Has that been a common occurrence of late years?—There have been some in all periods: there were several during Dr. Cullen's time; there was one on Hydrocephalus by Dr. Quin, at Dublin. There has been one at a latter period, upon Hemorrhage from the Arteries, by Dr. Jones, of Barbadoes. Such Theses have occurred occasionally, but they have not been numerous. The Theses would much more frequently, I believe, form the nuclei of future publications if they were written in English, than in Latin.

Do you think sufficient care is taken to ascertain if those who are candidates for Medical degrees are adequately acquainted with their own language?—I should think not. I am not aware of any means that have been taken in this University for that purpose. There is no Literary Composition of any kind required of candidates for graduation which they cannot get done for them. It is this circumstance which has induced me to suggest the propriety of giving the candidates for graduation a distinct set of questions, and obliging them to sit and write their answers to these questions in presence of some of the Professors. The greater part of the Medical men in France seem to write their own language with great ease and accuracy; and I have no doubt that the students of Medicine in this country would write English infinitely better than they do at present, if some plan similar to that which I have suggested were adopted.

The age required for the admission of graduates is twenty-one; do you think any improvement would arise from requiring them to wait a longer period?—I do not think it should extend beyond twenty-two.

Do you consider that it ought to be extended to twenty-two?—I think that if the system of education were improved, there would be an advantage in extending the age for graduation to twenty-two.

Will you have the goodness to proceed with any further observations you have to offer?—The next suggestion which I have to make is, *4th*, That each Professor should be provided with a text-book for his course, containing a statement of the general principles of the Science which he teaches, with references to the latest and best sources of information. I am persuaded it would be of great advantage to the students that each Professor was required either to adopt some text-book for his course of lectures, or to prepare one of his own, within a certain period after his appointment. Such text-books should contain not merely a Syllabus of the Professor's Lectures, but a statement of the general facts or principles best ascertained in the science which he is specially appointed to teach. These text-books would not only serve as useful guides for the students, by directing the course of their reading and enabling them to prepare themselves for examinations, but would save them much time and money; and the whole of them taken together would form a valuable compend of medical knowledge. Such text-books would also be of great importance, by pointing out distinctly the particular subjects which are treated of by each Professor, and thus preventing any collision between them, or unnecessary loss of time from their going over the same ground in their different courses. Those who are conversant with Medical Literature must be aware how few works of this kind have hitherto been produced in this country, compared with the number of excellent manuals or text-books that have been published at the different continental Universities. Indeed, in several foreign Universities the Programmes of the Lectures to be delivered in each department of Literature, Philosophy, and Science, published at the commencement of each session, besides mentioning the names of the Professors, and their days and hours of meeting, state the text-book which each follows in his course.

Have such text-books been common in this University?—Dr. Cullen, in the Medical School, Professor Ferguson, Professor Bruce, Professor Stewart, Professor Playfair, and Dr. Brown, who died whilst engaged in the preparation of a text-book, have all given elementary books of that sort.

Was not a great part of Dr. Cullen's First Lines rather theoretical, than otherwise?—No. They were a generalization of practical knowledge, and the most remarkable generalization of practical Medical knowledge, perhaps, that yet exists. There were, it is true, points of theory which he laboured; but these, I think, could be taken away very easily, without detracting very much from the originality or the value of his work.

Will you proceed to your next head of observations?—These relate, *5th*, to the extension of the Summer Courses, such as Botany, Natural History, Clinical Surgery, Clinical Medicine, and Medical Jurisprudence, to the same length with the Winter Courses; and the extension

University of Edinburgh.

Dr. John Thomson.

23 January 1827.

of some of the Winter Courses, such as the Practice of Physic and Chemistry. In place of the present division of the Academic Session into a Winter Course of six, and a Summer Course of three months, which is a nominal division,—for they are neither of them actually extended to that length of time,—there might, I conceive, be annually two courses, each of full five months' duration,—it being quite obvious that there is no branch of knowledge, for which a Professorship has been instituted, a sufficiently accurate and extensive view of the principles of which can be given in a three months' course. At present both the winter and summer courses are shortened by the occurrence of the Sacrament week, about the time of their commencement; and there is an interruption of a week or ten days at Christmas, which is not only unnecessary, but most prejudicial in its effects on the students. Some of the courses, indeed, which are at present delivered in from five to six months, would require to be of nine or ten months' duration, particularly the Practice of Physic and Chemistry. In proof of the impossibility of delivering a complete Course of Lectures on the Practice of Physic, in the time at present allotted for it, I may refer to Dr. Cullen's statement of his own experience in this matter:—"Some great defects of my course," says he, in a copy of his MS. Lectures in my possession, "are very obvious; but I believe they are unavoidable. I have not done so much as was to be wished; I have left many subjects untouched, and I have not been so complete on any one subject as I desired to be. But I say that this is the fault of every course that has been given in the same circumstances. It is an unavoidable consequence of the great extent of the subject and the short time that is allowed for it. In these circumstances we must necessarily take the alternative, either to touch a few subjects fully and neglect some others, or by touching these subjects also, to treat no one properly as it ought to be." I believe that Dr. Cullen's successor, Dr. Gregory, felt the same difficulty of condensing the materials of his course, so as to suit the Academic session; and I know that his successor, Dr. Home, has been obliged, in order to complete the view which he takes in his course of the Practice of Physic, to lecture for two hours daily for a considerable period towards the end of the winter session. I have myself felt the same difficulty in the private course of Lectures on the Practice of Physic, which I have for some years been engaged in delivering. I believe it would be difficult to carry into effect any plan for remedying this evil, except an extension of the duration of the course, or the concentrating the information to be given in the lectures, by the assistance of a text-book. With the view of keeping the attention of students directed for a sufficient length of time to this very important and extensive branch of Medical study, several of the Universities on the continent of Europe require that the Practice of Physic shall be attended during two sessions at least; and in this country the same demand is made by the Army and Navy Medical Boards of those who enter the public service. No science ever extended its boundaries with such extraordinary rapidity as Chemistry has done during the last forty years. Besides a course, therefore, explanatory of the general principles of Chemistry, and of the application of these to the common arts of life, which must form the principal part of a course,—addressed, like that delivered with so much ability and success in this University, to a mixed audience,—I think that there ought to be an additional, perhaps a summer course of Chemistry, intended specially for the instruction of Medical students, in which the composition of animal and vegetable substances, and the particular application of Chemistry to Pharmacy, should be fully considered, as these subjects, though foreign to the pursuits of individuals studying Chemistry, merely as a branch of liberal education, and consequently uninteresting to them, are nevertheless of the utmost importance to students and practitioners of Medicine.

Is there any particular evil resulting from Christmas holidays besides the loss of time?—Yes, it has the most remarkable effect on all the classes it is possible to conceive. You have all the students attentive and eager, you would suppose, to receive instruction before Christmas occurs; but when the classes meet again, some of them do not return, and still more return with diminished ardour for their studies. The greater part of the students here are strangers, who have no friends to go to during the Christmas holidays, and are consequently set adrift to find out amusement for themselves; so that by the time the classes meet again, many of them have formed acquaintances, and have contracted habits, which disqualify them for the future steady prosecution of their studies. I think the examinations would tend very much to correct this evil; for I hold it at present to be one of greater magnitude than it is possible for any person to conceive, who has not had occasion to address students, in this school, before and after Christmas.

Does that evil exist in other Colleges, as well as in Edinburgh?—I do not know.

Might not the length of the Christmas recess be abridged?—Christmas-day, of necessity, is a holiday; but there seems to be no good reason why it should be followed by a week of idleness.

How long does the Christmas vacation continue here?—It generally extends to ten days.

How long has it been of that duration?—It is only of late, I believe, that the custom of giving this long vacation has crept in.

What has led to the lengthening of the holidays?—I do not know, I am sure. I believe that many of the students would be glad to have a week of holidays every six weeks, if they were left to themselves.

Did some of the members of the Medical Faculty object to that extension of the Christmas holidays while you were a member of the Senate?—Yes; several continued to lecture during the Christmas vacation; I am not sure but Dr. Monro lectured this very last term. I have known several continue to lecture; but that is a disagreeable thing. In fact, a number of students, expecting that there is to be a vacation of that duration, get themselves invited to the country for the Christmas holidays; and when they come back, they are vexed that the Professor should have gone over a subject, which they considered as of importance, in their absence.

University of Edinburgh.

Dr. John Thomson.

23 January 1827.

Though they go away voluntarily, they are unwilling to lose any part of the lectures which are given.

Have you observed towards the conclusion of the session a relaxation of attention on the part of the students?—Yes, a relaxation which, I conceive, would also be corrected by the weekly examinations. Whenever good weather sets in, it is extremely difficult to keep up the numbers: there is no danger of the class being ill attended in bad weather.

Do you think the same thing would probably take place, if their attention were kept up by examination, and if they had an opportunity of distinguishing themselves towards the close of the session?—I have no doubt they would keep up to the last hour; indeed, all their labours would, of necessity, be directed towards the examination they were to undergo at the conclusion of the session; at least, a great portion of them.

You have proposed the extension of the Summer course; do you consider that that would be any hardship on the generality of Medical students?—No, I do not think it would.

Do you understand that a great portion of them continue in Edinburgh, the town or the neighbourhood, during the summer?—Many of those who come from the vicinity of Edinburgh return home; but a great portion of those who come from a considerable distance remain in Edinburgh or its vicinity, during the summer months. They are occupied about two months and a half, not much more, by their classes, and the rest of the summer might be advantageously spent, if their attention were directed, as I shall mention presently, to Clinical studies. As to the division of the Theory or Institutions of Medicine into two distinct courses of lectures, the one on Physiology, and the other on Pathology, I may remark, 6*th*, That the Institutions or Theory of Medicine, as taught in this University, comprehend three branches of Medical Science of great extent—Physiology, Pathology, and Therapeutics. The late Dr. Cullen, so far back as the year 1772, was aware of the impossibility of giving a sufficient view of all these branches in a course of six months' duration. "I have," he says, "been long persuaded that the time allotted for the course of the Institutions is by a great deal too short, and I have never been able to finish a course without extending the time of it beyond the usual limits, and even then I omitted some things I wished to have mentioned, and abridged others that I willingly would have enlarged." "The late celebrated Dr. Boerhaave," he adds, "bestowed six months upon the Physiology, and hardly two upon the Pathology and Therapeutics; but, for my part, I am persuaded, that in Institutions that are a proper introduction to practice, the Pathology and Therapeutics should have a considerable share of our time. I must say, this plan is not easily executed, the Physiology being a very extensive subject." Dr. Cullen divided his course of Physiology into nine parts or divisions; he lectured on four or five of these in the course of a session, but never on more. He afterwards proceeded to the Pathology, for which he employed a useful text-book, that of Gaubius of Leyden; and after giving an abridged view of Pathology, he then proceeded to the Therapeutics, so that students might have a little of everything. The boundaries of each of the departments of Medical Science included under the head of the Institutions, have been progressively extended since the time of Dr. Cullen, by a great number of new and interesting discoveries relative to the functions of the animal economy, the derangements of these functions, and the means by which they may be best remedied; and the difficulty of teaching all of them, in one course of the ordinary academic duration, must have increased in proportion. In many Universities, accordingly, as in those of Paris, Vienna, Bologna, Pavia, Rome, &c., there is now a separate Professor appointed to teach Physiology; whilst in others, as in those of Berlin, Heidelberg, &c., the Professor of Anatomy gives a full and separate course of Physiology during the summer session. Physiology has been taught in Edinburgh as a separate branch of study, in courses of six months' duration, by two private lecturers, Mr. John Allen, now Master of Dulwich College, and the late Dr. John Gordon; and each of these courses was productive of great advantage to the students, and of much reputation to the Medical School of Edinburgh. For improving the mode of teaching the Institutions of Medicine at this University, I would propose, either that the Physiology should be separated from the Pathology and Therapeutics, and delivered by a distinct Professor; or, if it should be considered inexpedient to institute an additional Professorship on the Theory of Medicine, that the Physiology should be delivered during one session, and the Pathology during another—these being obviously branches of Medical Science of so great extent and importance, as not to admit of being comprised in a single course of six months' duration. A separate course of lectures on Pathology might embrace not only functional derangements, to which Pathological Lectures, when forming a part of the Institutions, are generally confined, but organic alterations of structure, or what is termed Pathological Anatomy—a branch of Medical education which is now everywhere considered as of the utmost importance, but which has not yet been taught in a connected form in this University. The part of the Institutions of Medicine, denominated Therapeutics, belongs strictly, I conceive, to the Professor of Materia Medica, or rather should constitute the proper business of his course, as it treats of the general indications of cure to be fulfilled in the practice of Medicine, and of the various means, Dietetic, Remedial, and Regiminal, by which these indications may be best fulfilled. Materia Medica can never be taught, I conceive, advantageously to students, but upon the plan of a Course of Lectures on Therapeutics. Taught, as it has frequently been, on Alphabetical, Natural History, or Botanical arrangements, Materia Medica can only form a rude indigested mass of facts, devoid of all natural connection with one another, and disjoined from those general principles which ought to guide practitioners in the employment of remedies. I hold it to be essentially necessary that students should have acquired some knowledge of Chemistry, Natural History, and Botany, before they attend lectures upon Materia Medica; for it is impossible to conceive a greater waste of time than that the Professor of this important practical branch of Medicine should be occupied in teaching the details of all these auxiliary sciences.

1827

University of Edinburgh.

Dr. John Thomson.

23 January 1827.

Have you any thing to suggest, as to the order in which these subjects should be taught?—Yes, I have afterwards to mention that from my notes. The manner of teaching the Institutions of Medicine in this University forms a remarkable contrast with the system pursued in the Universities on the Continent, and the consequence of it has been, that we have not in the English language a single original work which we can consider as Elementary, on Physiology, Pathology, or Therapeutics, at all adapted to the present state of these sciences; and we are therefore obliged to have recourse, either to the original Continental works upon these subjects, or to translations, and of many of them there are no good translations.

Are there not three different Professors for these branches in Paris?—Yes, there are; and in the different schools I have mentioned, there is a distinct Professor of Physiology. It sometimes happens, that the Professor of Physiology treats also of Pathology; but in many Medical Schools he does not. As to Surgery (*7th*), separated from Anatomy, and taught by a practical Surgeon, it is not unknown, I believe, to the Commissioners, that I have endeavoured to point out, in a printed paper addressed to the Patrons and Professors of the University, the advantages that would result from Surgery being taught as a branch of Medical Education, distinct from Anatomy, and by a Practical Surgeon. It has given me much satisfaction to learn, that this proposal has not only been very generally approved of by the Medical Profession, but that its propriety has been lately acknowledged by several members of the Medical Faculty in the University. I know of no part of Surgery that a Professor of Anatomy, who is not himself a Practical Surgeon, can teach with advantage to students, except the relative situation of the parts concerned in Surgical operations, usually denominated Surgical Anatomy, and the mechanical imitation of these operations on the dead body. The Medical principles of Surgery, and their application to particular cases, can be properly understood and explained by those only who are themselves engaged in the practical details of the art. As well, in my opinion, might a teacher of Anatomy, who is not himself a Practical Physician, pretend to teach the Principles and Practice of Physic, as one who is not a Practical Surgeon to teach those of Surgery—an art which is founded solely on the basis of experience. These are all the observations I have to trouble the Commissioners with on that head.

Edinburgh, Friday, 26th January, 1827.

The Right Honourable the LORD ADVOCATE in the Chair.

Dr. *John Thomson* called in, and further examined.

26 January 1827.

Will you have the goodness to proceed with the statement you were offering to the Commissioners at the adjournment of the last meeting, in regard to the changes that appear to you to be desirable in the system of Medical education pursued in the University of Edinburgh?—The *eighth* change I would propose in the system of Medical education at present pursued in this University, would be the establishment of one or more separate Professorships of Clinical Medicine. In the printed paper to which I formerly referred, I have explained the views I entertain with regard to the system of Clinical instruction at present pursued in the Medical School of Edinburgh; and I have endeavoured to show that it is liable to great objections, and susceptible of much improvement. I have no hesitation in giving it as my opinion, that the duty of teaching Clinical Medicine, if properly executed, is the most laborious and difficult that can be assigned to a Professor of Medicine; and that of all the branches of Medical education it is the one which it is most important for the interests of the public, and the reputation of the school, should be taught with the greatest ability and zeal. Indeed, I am persuaded, that next to improving the Literary and Scientific education of the graduates, there is no change that can be made in the system of Medical education in this University, to be compared, in importance in all its effects, with the improvement of the plan of Clinical instruction. I may remark in the *first* place, that upon the present system there is no member of the Medical Faculty, selected by the Patrons of the University, from a persuasion on their part of his being well qualified to teach Clinical Medicine. One Professor is selected as likely to teach the Institutions to most advantage; another, as likely to be the best lecturer on the Practice of Physic; a third, on Materia Medica, and so forth; while Clinical Medicine, which is surely as deserving as these or any other branch of Medicine, of being the subject of a special appointment, is left to be taught by the Professors of the other branches, in the manner which they may find most conducive to their own convenience and interests. 2*dly*, The duties which several of the members of the Medical Faculty are actually appointed to perform, bear so little relation to the teaching of Clinical Medicine, that excellence in both departments can be but of rare occurrence, and should certainly never be relied upon in the arrangements of a great National Seminary. It is true that there is no positive obligation on the members of the Medical Faculty to deliver Clinical Lectures, and it may consequently be expected that such of them as do not feel themselves competent to the task, will wave their privilege in favour of their colleagues; but I doubt much the expediency of allowing the determination of a matter of so great importance to depend upon the issue of a conflict between duty and interest, particularly as it is well known how difficult it is even for men of an enlarged understanding to judge properly of the nature of their own talents, and of the direction in which they may be most usefully employed. 3*dly*, The proper duties of some of the members of the Medical Faculty are, it must be allowed, very closely allied with that of teaching Clinical Medicine, especially those of the Professors of the Practice of Physic and Materia Medica; and, accordingly, in many Medical schools, the duties of teaching the Practice of Physic and Clinical Medicine are conjoined in one individual, who is always, I believe, in these circumstances permanent Physician to an hospital. But there are many other schools—Paris, Genoa, Pavia, Rome—in which separate Professors are named to perform

University of Edinburgh.

Dr. John Thomson.

26 January 1827.

this duty alone; and in no single University which I have visited, or of which I have heard, has an arrangement been adopted, by which all the members of the Medical Faculty are, as in that of Edinburgh, entitled to officiate in their turns as Clinical Professors. Though I am fully convinced that there can be no better preparation for a Professor of the Practice of Physic than having been engaged in teaching Clinical Medicine, yet I am persuaded that, in a large school and city such as Edinburgh, the Professor of the Practice of Physic should not be fettered with Academic duties of so great weight as to prevent him from engaging in consultation Practice to a considerable extent. Were he to be so, this Chair would cease to be an object of ambition to the first men of the profession, and the University would lose the reputation which it must always derive from the possession of a teacher, whose professional character stands high in public estimation. *4thly*, The system of rotation followed in Edinburgh, whilst it affords no means of excluding, from the privilege of teaching Clinical Medicine, such members of the Medical Faculty as may not be very well qualified for the task, does not even ensure its being performed by those members who are the best qualified for it, in the event of their finding, as must frequently be the case, that their time may be more profitably spent in other avocations; for the divided emoluments arising from teaching Clinical Medicine in this school are too small to induce any one to abandon private Practice, in order that he may be able, when his turn of teaching Clinical Medicine comes round, to devote his time exclusively to the performance of that duty. The account which has been given by the late Dr. Gregory, in his Memorial to the Managers of the Royal Infirmary, of the progress of Clinical Lectures in Edinburgh, illustrates, in a striking manner, the consequences which have resulted from the want of a proper provision having been made for the teaching of this branch of Medicine. "Far from being eager," says Dr. Gregory, "to attend in the Clinical wards, each in his turn, for the sake of the improvement and experience which they might acquire, many of the Medical Professors could never be induced, either by the emoluments of that office or their own acknowledged sense of duty, to take any share of the Clinical Lectures. The plain truth is, that they are so severe a labour, both in point of attention and time, that all of us feel them very irksome, even though our time of attendance is but three months; and as Clinical Lectures cannot be prepared beforehand, as those on every other branch of Physic may be, and ought to be, the incessant drudgery of preparing them from day to day, and the consequent interruption of all other study, and much other business, even for so short a time as three months, is often very inconvenient, and sometimes quite intolerable." Such being the account which Dr. Gregory has given of the arduous nature of the study of teaching Clinical Medicine, it will not appear surprising that both Dr. Cullen and he, certainly the two ablest individuals who have ever been engaged in this school in the delivery of Clinical Lectures, abandoned their share of this duty to their colleagues, as soon as they found themselves established in extensive private practice. *5thly*, By the present system of rotation among the members of the Medical Faculty, very great difficulty is thrown in the way of any one of them attaining to excellence in teaching Clinical Medicine; for scarcely has a Clinical Professor begun to be familiar with the duties of his situation, when he finds himself obliged to make way for another; and before his period of duty comes round again, he must, in a great measure, have lost the benefit of his previous experience. The only way in which this evil could be diminished would be, by each Professor who teaches Clinical Medicine being Physician to an hospital, and continuing, during the period that he did not deliver regular Clinical Lectures, to make Clinical observations to such students as might accompany him on his visits. But *6thly*, Besides the injury that must result to the patients, the pupils, and the public at large, from the Clinical Teacher being so frequently changed, this system gives rise to an evil of a most serious nature, from which the students are, in the first instance, only the principal sufferers, and which is not the less prejudicial in its effects upon them, that they are often led to regard it as an advantage—I mean, the variety of modes of practice which they may witness in the course of a very short space of time. It would, I am persuaded, be considered as a very strange recommendation of a course of lectures on the Practice of Physic, that the duty of delivering it was divided between three or four Professors, entertaining opposite Medical opinions from one another, and that the subjects discussed in each three months were consequently treated of on different principles—in the first, on those of the Depleting System—in the second, on those of the Repleting System—and in the last three month's on those of Expectant Medicine. Such an arrangement, it would be readily allowed, could not fail to perplex the minds of young students. Nor would the evil be less if, instead of prelecting on different topics, these conjoint Professors were successively to treat of the same subjects, and each to exhibit them to his pupils in a different point of view. The pupils, indeed, might feel satisfied that their instructors were not all in the right; but it might be more difficult for them to determine in their own minds, whether they were not all in the wrong. I am persuaded, however, that there is no just reason why a course of lectures on Clinical Medicine should not exhibit the same uniformity of design, principles, and execution, as a course on any other branch of Medical Science. It is not surely a task suitable for tyros in the art of Medicine to compare together, and to form a judgment respecting the merits of different modes of treatment, unprepared as they must be to estimate duly the proper application of the rules of the art or general results of experience, to individual cases, or to attach a just importance to those accessory or accidental circumstances, on which the ultimate success of Medical Practice frequently depends. *7thly*, The professed object of Clinical instruction is to bring students of Medicine into the near and personal observation of diseases, and to afford them an opportunity of having pointed out to their notice the phenomena of diseases, and the effects of remedies as they occur in individual cases. Unless a student, therefore, in his attendance on a Clinical Hospital is called upon to exert all those powers of observation and of intellect on the skilful exercise of which his success as a prac-

titioner is afterwards to depend, he might be more profitably employed in his closet at home, in reading over a series of the many thousand Medical cases that have been put upon record, than in listening to reports and prescriptions in a Clinical ward, where he has but little, if any, opportunity of seeing the patients. The number of students that attend the Clinical wards of the Royal Infirmary during the winter session renders it impossible for a very large proportion of them to benefit by the instruction to be derived from the use of their senses. To most of them, indeed, as the Clinical lectures have hitherto been conducted, it is a matter of no moment whether or no the patient be present. I am glad to learn that the members of the Medical Faculty have, since the Commission has begun to sit, become convinced that some change in this respect was necessary, and that two Professors are this winter employed at the same time in giving Clinical courses; for, imperfect as the system of Clinical instruction in the Royal Infirmary is in other respects, this arrangement will undoubtedly afford to a larger proportion of the students than formerly, an opportunity of seeing the patients whose cases they hear described. It appears to me, however, that in order to prevent this arrangement from proving prejudicial rather than advantageous, it will be necessary to take measures for preventing young students from frequenting both sets of wards and lectures, under the erroneous idea that their improvement will be proportional to the extent of their sphere of observation, and the variety of the modes of practice they see employed. Clinical teachers are very generally agreed, that, provided the patients in a Clinical ward be well selected, they should not be very numerous, as this tends only to distract and perplex the minds of the students. I have already suggested a measure which, if adopted, would tend to diminish the number of students attending during the winter session in the Clinical wards—I mean the lengthening of the summer course of lectures, so as to make it suit for graduation. I believe there exists at present a very great disproportion between the numbers who attend the winter and the summer courses of Clinical lectures; and that this is in a great measure owing to attendance on the summer course not qualifying for graduation. Were the fee for attendance on a second course of Clinical lectures to be only one-half of that for the first, I believe that this measure, by inducing students to prolong their attendance on the Clinical lectures, would be found equally advantageous for Professors and students. 8*thly*, In order, however, that attendance on a course of Clinical lectures should prove in the highest degree advantageous to a student, it is not enough that he should have merely an opportunity of exercising his organs of external sense. Judging from what I have myself had an opportunity of witnessing in the Clinical schools of the continent, and from what I have heard of the system of Clinical instruction pursued in other schools which I had not an opportunity of visiting, I am much disposed to doubt, if there be any Clinical institution in existence, in which the students play so completely the part of mere spectators as in that of Edinburgh. Indeed, I am convinced, that in this department of Medical instruction, we are in this country greatly behind all the Medical schools on the continent. It may be, that in some Continental Hospitals more attention is paid to the instruction of the students than is consistent with what, in this country, we consider to be due to the comfort of the patients; but, at all events, the practice of these Institutions might suggest a variety of arrangements, no ways inconsistent with the safety of the patients, and much more conducive to the instruction of the pupils than the system on which Clinical Medicine is at present taught in Edinburgh. If young men were appointed to do the duties of Clinical clerks, who had already finished their academical education, and were so far advanced in a knowledge of their profession, as to be capable of taking some charge of the studies of the pupils, the students might be divided into parties, consisting of a determinate number; and each party might in its turn accompany one of the Clinical clerks on his morning and evening visits of his patients, so as to be present when he draws up, or to draw up themselves, under his superintendence, the cases of the patients, or the reports of their progress since the preceding visit, whilst the Professor might take care to ensure, by frequent inspection and examination, that each of his pupils is attending to, and is comprehending what is going on before his eyes. 9*thly*, But whilst I offer these suggestions with regard to the improvement of the system of Clinical instruction, I am aware that the successful execution of these and of other measures for the accomplishment of this object, must mainly depend upon the intelligence, zeal, and practical experience of the individuals who are entrusted with the duty of carrying them into effect; and I know of no way in which the zeal of any teacher can be more surely called into action than by making his interest and reputation depend on the manner in which he executes his duties. To a Professor specially appointed to teach Clinical Medicine, the successful discharge of this duty would not only be a present source of emolument, but his chief or only means of attaining higher advancement. On the present system, the teaching of Clinical Medicine is a duty superadded to those of other Chairs—a duty on the execution of which the Professors depend, in a comparatively slight degree only, for emolument or for reputation. 10*thly*, The experience of other countries has shown that a Clinical school, properly conducted, is capable of exerting a most powerful influence on the diffusion of Medical knowledge beyond its own necessarily limited sphere. There would, I believe, be little difficulty in tracing the extraordinary zeal and success with which all branches of Medical science are at present prosecuted at Paris, for example, and the great number of valuable publications to which these have given rise, surpassing, I am persuaded, any thing to be found in the previous history of Medicine, to the influence of the system of Clinical instruction which has been pursued in its Medical school for the last thirty years. The Clinical School of Edinburgh is of much longer standing; and when we consider the eminence of the individuals who have successively been attached to it, we are necessarily forced to attribute the inferiority of the fruits which it has yielded to that pernicious system of rotation, which makes the most difficult department of Medical instruction a matter of secondary importance, and renders it impossible for any one of those who are engaged in teaching it, to

University of Edinburgh.

Dr. John Thomson.

26 January 1827.

follow out such a continued train of observation as can be useful to themselves, their pupils, or the public. I am persuaded, therefore, that the appointment of one or more Professors, whose special duty it should be to teach Clinical Medicine upon a plan similar to that which is followed in the Medical Schools on the continent, would go as far as any institution of the kind can go, to secure its being taught to the greatest advantage,—by enabling the Patrons to select for the duty an individual whom they considered well qualified to fulfil it,—by enabling the individual appointed to devote his uninterrupted attention to improving his qualifications for the office,—and by securing to the patients and students, and to the public at large, the benefit of a continued train of observation; whilst it would tend at the same time to improve the whole system of Medical education, by enabling each of the other members of the Medical Faculty to direct his undivided attention to the department of the science which he is appointed to teach. In the opinions which I have expressed with regard to the state of Clinical instruction in the Edinburgh School of Medicine, compared with that followed in the different Medical Schools on the continent of Europe, I feel assured that I shall have the support of all those who have had an opportunity of making this comparison. I had the pleasure to receive a few days ago from Dr. Clark, late of Rome, a physician who has bestowed a great deal of attention on the state of Practical Medicine in the different countries of Europe, some very judicious observations on the system of teaching Clinical Medicine in the University of Edinburgh, with suggestions for its improvement, which he has addressed to the Patrons and Professors of that Institution. These are all the observations I have to make upon the subject of Clinical Medicine.

Do you contemplate the appointment of only one Professor of Clinical Medicine?—I think more would be necessary; but I have stated one or more, because I know how strong objections are entertained to the addition of more Professors to the Medical Faculty.

How many of the Medical students at the University, do you conceive, should be attending the Lectures on Clinical Medicine?—I think there should be from 200 to 300.

From that number of students, must not a great difficulty occur in the opportunities of seeing patients in the manner you have described?—Yes, very considerable difficulties. Indeed, unless some means are fallen upon, in order to diminish these difficulties, I think that students will go to other schools, in quest of those practical opportunities which they do not find here. But my belief is, that they can be just as readily afforded in Edinburgh as in the Hospitals of any other place.

How many students do you think could, with advantage, attend the Professor or his colleague in his private rounds?—I think each could take 20 or 30 at a time; not easily a larger number.

How could that be managed with 200 students?—They might be divided and subdivided into parties; and, independently of the general mid-day visit, when all the students should be present, there might be a morning and an evening visit, at each of which there should be only a party present. My belief is, that the teachers, as well as the students of Clinical Medicine, should have very little else to do. At present, the Professor of Clinical Medicine goes to the Hospital at the ordinary visiting hour at 12 o'clock; he sees the patients; he hears the account of their cases read out to him from the journals by the clerks; but he never goes back unless there is an urgent case. At all events he does not meet the students in the Hospital at any other time. A Clinical Professor, according to the notions I have of his duty (and I have seen this practised in all the countries on the continent), should be in the Hospital a great part of the day.

How many wards do you contemplate there should be for the Clinical Professor?—Each Clinical Professor should have one for male, and another for female patients. One of the best Clinical Institutions I have ever seen was at Göttingen, where there were only 12 or 14 patients in each ward; and in the Clinicum attached to the Great Hospital at Vienna, where there is an immense number of patients, each of the Clinical wards receives only 12 or 14; and the same, I am informed, is true with regard to a Clinicum attached to one of the largest military hospitals in Europe at Petersburgh, where a judicious selection is made of the cases which are to be brought into this Clinicum. The attention of the students in the Clinicum to which I refer is directed to a small number of cases, and kept fixed upon them. In some of the Clinical Schools which I have visited, I have seen the students examined at the bed-side of the patients occasionally, in a manner I could not altogether approve of, and which would not readily be permitted in this country. There are many cases of disease, however, where the examination of the students can be carried on to the greatest advantage without any detriment to the patient. But retiring into an adjoining room, after visiting the patients, and making observations off-hand upon their cases, which is a very common practice with the Clinical Professors on the continent, is of the greatest advantage to the students from their having thus the opportunity of immediately returning, and seeing circumstances which perhaps had escaped their notice. I see no reason why every ward in the Infirmary should not be converted into a Clinical School, for the instruction of students. Though, till very lately, no Clinical Lectures were given in the Hospitals of London, the students there pay a fee to the Physicians or Surgeons of the Hospital; and it is understood that any student may go up to the Medical officer, whose visit he follows, and they do it every day, and ask questions relative to any case; or the Medical officer himself takes an opportunity, if there is any thing worthy of notice in any of the cases, to turn round to the students and give an explanation. Though this mode of instruction is, in my opinion, greatly inferior, in many respects, to that by regular Clinical Lectures, yet it obviously establishes a reciprocity of interest between the students and all the medical officers of the Hospital, which does not exist in this country.

Is there any thing to prevent students, or is it not the custom for them to attend the Ordinary Physicians of the Infirmary in going their rounds?—They attend very little, for

University of Edinburgh.

Dr. John Thomson.

26 January 1827.

this plain reason, that it has not been the custom for the Ordinary Physicians to give Clinical instruction; on the contrary, the Ordinary Physicians or Surgeons are prohibited from doing so by the rules of the Hospital. It would be considered as an encroachment upon a privilege, at this moment annexed to the members of the Medical Faculty in the University.

Do you understand that the Ordinary Physicians of the Hospital are not allowed to state any thing to the students attending them?—They are not exactly prohibited in any case from turning round, and saying—"This, gentlemen, is a very uncommon and particular case, and it is worthy of your attention;" but it is no part of their duty to communicate information to the students, and I know it is seldom, if ever, done. I know also, that the repetition of such addresses would be considered as an encroachment upon the privilege of the Medical Faculty.

Do you not apprehend, that, in many cases, the frequent visits of the students and their minute inquiries must interfere with the recovery of the patients?—Yes; but I think there would be a great deal less of it upon a proper system of Clinical instruction than there is at present. In my time the Infirmary used to be open from morning till night; and, unless there were particular orders given to shut up a patient from intercourse with the students, they were liable to be questioned and teased by a succession of students during the whole of the day. I believe that certain changes have been lately introduced since I was in personal attendance upon the Royal Infirmary; and there is no change which can be made in that respect, that must not be valuable and useful.

Must not the disturbance given to patients, of course, be less, if students were limited to particular wards?—As to limiting students to particular wards, that is a subject on which I have quite made up my mind. I do not think there should be any Hospital maintained at the public expense, where the whole of the wards are not converted into a School of Practical Physic. I have written some observations upon that subject, which are not yet published; but that is the notion I entertain with regard to all public Hospitals. The first object of these institutions is unquestionably the cure of the sick and diseased poor. The second object, and one which is by no means incompatible with the former, is the practical instruction of young men breeding to the Medical profession. I am glad to find, that at Glasgow, during the present winter, and at Aberdeen, they have entered upon the practice of teaching Clinical Medicine upon these principles. I hope there will soon be no public Hospital in this country, in which Clinical instruction of one kind or another is not afforded to students of Medicine.

Do you not think it likely that there would be a less regular supply of patients, if it were known that this mode were to be followed?—No; I do not believe that there would. Patients, in general, are rather pleased with the attention that is paid to them. There might be an objection to it with some; but, upon the whole, we find they are exceedingly pleased with the attention given by the Professor, or by his clerks, to their ailments. I am satisfied no patient would be permitted to be teased by the students. They would be only allowed to examine, in the presence of the Professor or his clerks, specially appointed for that purpose; and I feel assured, that in that way the questions put, would all tend to some useful end, and the patients would, on the whole, have fewer questions put to them by the students than at present.

Do you contemplate that two Professors should be lecturing at the same time, or that one should lecture during one part of the year, and the other during the other?—If there were two Professors of Clinical Medicine, each should have his separate wards and his separate students, and should lecture throughout the whole, or at least the greater part of the year.

So that you think the students of the one should not interfere with the other?—No; they should not interfere with the other: if they did so, they would just be running about idle. I think also, that the system of examination should be introduced into the Clinical instruction, and that would completely prevent the students going from the one Professor to the other. If the public hour of visiting were the same for both Professors, it would also completely prevent students gadding about from one set of wards to the other.

Have you any suggestion to offer upon the state of Clinical Surgery, or do you consider that it stands, at present, upon a satisfactory footing?—I do not consider that, at present, it is upon a satisfactory footing, inasmuch as the Professor has no separate ward. I think the Professor of Clinical Surgery should, as far as possible, be placed on the same footing with the Professors of Clinical Medicine; he ought to have separate wards and assistants.

Do you propose that there should be more than one Professor of Clinical Surgery?—If the candidates for Medical degrees were required to attend Clinical Surgery, as I think they ought to be, there would be enough of duty for two Professors of this branch; but I do not believe that more than one is necessary at present. If the Managers of the Royal Infirmary were to add the High School to that establishment, and to convert it into a Clinical Hospital for the University, I am satisfied it would be of the greatest use to the Medical School of Edinburgh, and would afford opportunities for Clinical instruction superior to any that have hitherto been enjoyed in this place.

Will you have the goodness to proceed with any further observations you may have to offer?—The next improvement that I would recommend would be, 9*thly*, A regular course of Medical study being prescribed. The propriety of this measure seems to me to arise from the connexion and dependency which exist between the different branches of Medical Science, and which render it necessary for the student, in order to be able to study some of these branches with advantage, to have previously acquired a knowledge of one or more of the other branches. Thus, for example, he who begins to study the Institutions or Theory of Medicine, before having acquired a knowledge of Anatomy, or to study the Practice of Physic before having acquired a knowledge of the Institutions, does little better than waste his time. Yet it is far from being a rare occurrence, to meet with students commencing their Medical education in Edinburgh, by attendance on the Practical and Clinical courses. In other Schools, where the extent of Academic education required of Medical graduates is fixed, as at Paris and

University of Edinburgh.

Dr. John Thomson.

26 January 1827.

Vienna, the order in which the different branches are to be studied is also fixed by regulation. I am persuaded that much time and money are lost by the students in this School, from their not being aware of the proper order in which their studies should be conducted, and I would therefore recommend that a fixed course of study should be laid down for those students who intend to graduate, from which they should not be permitted to depart, unless they can assign some satisfactory reason for wishing to do so. In laying down a fixed course of University education for Medical graduates, it appears to me that it ought to be adopted as a general principle, that students should not be *obliged* to attend any University class more than once; and that if attendance on two courses of lectures on any branch be prescribed, it should be left to their own choice, whether to attend the Professor in the University for a second time, or a private lecturer. Wherever Universities exist, they must to a certain extent be supported by the possession of privilege; but, beyond a moderate extent, the privileges of a University must always become to those who enjoy them a source of indolence and negligence, instead of being, as they ought to be, an encouragement to assiduous exertion. I think, however, it would be but fair, and certainly more reputable to the University, in case it might be thought necessary to the proper education of Medical graduates, that they should attend second courses on any particular branches, that this should appear on the face of the Statuta; otherwise, I believe it will generally happen that those who stand most in need of this additional instruction will be the least disposed to avail themselves of it. The more industrious class of students who voluntarily extend their opportunities of obtaining professional information by attending second courses of lectures, lose with the public the credit of having done so, from its not appearing as a part of the regulations of the University from which they hold their degree. The University classes form often but an inconsiderable part of the number of classes attended by students. The course of Medical study might, perhaps, be arranged somewhat in the following order:—

First Winter Session.—Anatomy, Chemistry; with Natural Philosophy, if this course has not been previously attended.

First Summer Session.—Botany, Natural History, and Medical Chemistry.

Second Winter Session.—Physiology, Pathology, Materia Medica; with Logic or Moral Philosophy, if these courses have not been previously attended.

Second Summer Session.—Practical Anatomy and Practical Chemistry, at any School at which the students conceive they can be best obtained.

Third Winter Session.—Surgery, Clinical Surgery, and Practice of Medicine.

Fourth Winter Session.—Practice of Medicine, Clinical Medicine, Midwifery, and the Diseases of Women and Children; Medical Jurisprudence.

Attendance on some of these classes might be anticipated, or repeated, at the pleasure of the student; but this should not supersede the necessity of attendance on the classes enumerated in the order prescribed. The five branches of instruction which I regard as the most fundamental in a Medical Education are—Practical Anatomy, Practical Chemistry and Pharmacy, Clinical Surgery, Clinical Medicine, and Clinical Midwifery. In the arrangement of the course of study to be pursued by Candidates for Medical degrees, there is only one Medical class established in the University which I have not included, viz. that of Military Surgery. As this class has, for its more peculiar object, the instruction of those destined for the Medical service of the Army and Navy, I am convinced that it should receive its encouragement chiefly from the Medical Boards of public service. I am happy to see, by the Syllabus of his Lectures, that the present Professor of Military Surgery has extended his Prelections to a subject of great importance, which, when I held that situation, I had it in view to include in my course, but which, from the service in which he has been engaged, he is much better qualified to teach than I was—I mean, the Diseases of Warm Climates. It is quite obvious, of how much importance it must be to those who are to act as Medical Officers in the Army or Navy, or in the East India Company's service, that they should have their attention directed in a particular manner to these diseases by one who has had opportunities of observing and treating them. I cannot but think that it would add greatly to the value of this class, if the students attending it had an opportunity of visiting the Military Hospitals in Edinburgh along with their teacher during the period of their attendance upon his Lectures. That this might be a valuable source of Clinical instruction to students, I am the more persuaded, from having had an opportunity, during the time I was attached to these Hospitals, to witness the interest that was taken by the Medical Officers of the Army and Navy in the regular visits which I held, and in several courses of Clinical Lectures on Military Medicine, which, with the approbation of the Director-General, I thought it my duty to read to them, on the cases of patients contained in these Hospitals. I feel assured, from what I know of the liberal views entertained by the Army Medical Board respecting the education of Medical men, and the zeal which they have evinced for the promotion of Military Medicine, that they would have the greatest pleasure in opening these Hospitals to the students destined for the public service, and in rendering them in every way conducive to their instruction. And were it recommended by the Boards of public service, that young men going through their Medical education at Edinburgh, with a view to enter their respective departments, should avail themselves of the opportunity of attending the Lectures of the Professor of Military Surgery, I am persuaded that the effect would be as beneficial to the public interest, as to that of this otherwise unprivileged Professor. In the printed observations which I took the liberty to submit to the consideration of this Commission at the commencement of its inquiries, I ventured to express my belief, that the introduction of improvements in the courses of study required for obtaining a Medical degree from the different Universities of Scotland, has been partly, at least, retarded by the apprehension which each University has entertained, that to raise the standard of qualifications required of its Graduates, might, without being productive of any public benefit, operate pre-

University of Edinburgh.

Dr. John Thomson.

26 January 1827.

judicially to its own interests, and only tend to promote those of its rivals. But it has not been merely with regard to one another, that the Scottish Universities have entertained this jealousy. The only plausible argument which I have ever heard adduced against the improvement of the education of the Medical Graduates of these Universities, has been, that if the difficulties of obtaining a Medical degree were to be increased, many students would content themselves with obtaining the diplomas of other bodies empowered to license Medical Practitioners, which do not require so extensive a course of education, nor subject their Licentiates to so satisfactory an examination as some of these Universities have been accustomed to do. This objection is obviously founded on the well known fact, that a very small proportion only of those who obtain Medical degrees in our Scottish Universities, afterwards confine themselves to the practice of Medicine strictly as Physicians, and that by far the greater number settle throughout the country, or in its colonies, or serve in the Army or Navy as general practitioners. In order to be qualified for this line of practice, it is necessary that they should be well acquainted with all the different branches of the healing art, because they must practise them indiscriminately, and often in circumstances where they cannot avail themselves of the advice or assistance of practitioners, older or more experienced than themselves. The course of study I have taken the liberty to suggest for the Medical Graduates of this University, has been drawn up with a view to qualify them for the performance of those important and responsible duties which are required of general Medical Practitioners; and it appears to me to be as short in point of duration, and as limited in point of extent, as ought to be received by any of the public bodies empowered to license Medical Practitioners of any description, whether Physicians, Surgeons, or Apothecaries. I by no means concur in a proposal which I have cently heard made, that a power should be conferred on the Universities of granting Licences to practise Surgery, because I am convinced that it will be much more for the interests of the public, that this right should remain where it has been long placed by the Legislature, with the different Colleges of Surgery in these kingdoms. I conceive that, in point of general principle, it would be much better that the determination of the course of study to be pursued by those wishing to practise Medicine, should be determined by the Legislature, and that the examinations into their actual qualifications should be entrusted to public bodies, such as the Colleges of Physicians and Surgeons who have no pecuniary interest in granting Licences to practise, rather than to those who are employed in teaching. And consequently, I am very doubtful whether, instead of conferring on the Universities the power of granting Licences to practise Surgery, even the granting of Licences to practise Physic to those who have obtained University degrees, should not be transferred to the different Colleges of Physicians in these kingdoms. The Practitioners of Medicine in Great Britain and Ireland may be divided into two classes; those who have received their education in Universities, and those who have received it chiefly or solely in private Literary and Medical schools. It is the former class chiefly who apply for Medical degrees, and qualify themselves to become Members of the Colleges of Physicians; the latter class usually obtain Licences to practise from the Colleges of Surgeons and Societies of Apothecaries, or become members of these bodies. The professional education of both these classes of practitioners, from the nature of the duties they have to perform to society, appear to me to require to be precisely the same, if we except, perhaps, the performance of Surgical operations; for it is well known, that the general practitioner, who may have only the diploma of a Surgeon or Apothecary, if extensively employed in practice, has every day occasion to prescribe for a greater number of patients, and for a greater variety of complaints, than Physicians who are in the greatest practice. It is this circumstance which renders the proper education preliminary and professional of the class of general Medical Practitioners, an object of so much importance to all ranks of society. A very large proportion, it is conceived, of those educated to the Medical Profession in these kingdoms, must continue to receive their professional, as well as their preparatory education in private schools, and it seems, therefore, to be extremely desirable, that the different public bodies entrusted with licensing the class of general practitioners of Medicine, should be obliged to pay much greater attention than they have hitherto done to the literary and professional qualifications of those to whom they grant their respective diplomas. Were an uniform and sufficiently extensive course of preparatory and professional education prescribed and enforced by the Legislature for this class of practitioners, their usefulness could not fail to be greatly increased, and a competition of the most beneficial kind would be established and maintained between the Universities of these kingdoms, and the private Medical Schools of London, Dublin, and Edinburgh. Though, perhaps, not strictly connected with the immediate object of the Commission's inquiries, I may be permitted to state, that the Charters and Statutes of the different public bodies entrusted with the power of licensing Medical Practitioners for these kingdoms, form, at present, a strange medley of incongruous regulations, framed, and, in most instances, it is to be feared, acted upon with but little, if any, reference to the interests of the public. Each of these bodies requires a different course of study, which, in most instances, is very insufficient from those on whom they confer Licences to practise Medicine; each of them possesses a monopoly of some branch of Medical Practice, or an exclusive right of practising a particular branch in a particular district of the country; and, unfortunately, it does not, in all instances, happen, that the extent of privilege which each of them has it in its power to confer on its Licentiates, increases and diminishes in the same proportion as the amount of qualifications which it requires of them. Among these Corporation Charters, the English Apothecaries' Act, which dates its origin no farther back than the year 1815, may perhaps be considered as one of the most objectionable in its provisions, and most prejudicial in its operation. By this Act, all persons are prevented from practising as Apothecaries in England and Wales, unless they shall be licensed by the Apothecaries' Company in London. Though the Act apparently only confers on the Company the exclusive privilege of licensing Apothecaries, it is

University of Edinburgh.

Dr. John Thomson.

26 January 1827.

well known, that, under this denomination, are included nine-tenths of the country Practitioners in England. It is only in large towns, if even in them, that the different departments of the Physician, Surgeon, and Apothecary can be kept separate. In other places, it is absolutely necessary for every Practitioner to dispense drugs, so that the Act really confers on the Apothecaries' Company a monopoly of licensing all the general practitioners in England and Wales. But whilst the exclusive privileges conferred by this Act on the Licentiates of the Society of Apothecaries are so extensive, the only positive provision which it makes for their education is, that they shall have served a five years' apprenticeship to an Apothecary. That it may be highly advantageous for young men entering upon the study of Medicine, to be placed under the superintendence of individuals able and willing to guide them in their studies, and that at a later period they may acquire much useful knowledge by attendance for a twelve-month or more at an apothecary's shop, will not be denied. But why young men should be obliged to pay a large fee, and to perform the menial offices of an apothecary's apprentice for a period of five years, in return for advantages which a great number of them, at least, would obtain upon much easier terms, but for this interference of the Legislature, it is difficult to conceive. Even in the most favourable circumstances, therefore, where an apprenticeship may be supposed calculated to promote a young man's Medical studies, the arrangement made in the Apothecaries' Act is obviously one in which the interests of those who are training to the profession are sacrificed to the interests of those who are already engaged in its practice. But when we remember the circumstances under which a large proportion of these apprenticeships must be passed at a distance from any school, where either preparatory or professional knowledge might be acquired, the evil to which they give rise, assumes a still more serious character. For it is in vain to expect, that even the most conscientious master can compensate to his apprentices, by his own instruction, for the want of those opportunities of acquiring a knowledge of the different branches of Medicine that are afforded by attendance on the instructions and lectures of professed teachers. And when we remember how small a portion of country practitioners can have the leisure, even if they had the inclination and ability necessary for guiding the studies of their apprentices, we cannot be surprised that apprenticeships of this kind should be, what they are now generally considered by the liberal and enlightened part of the profession, more frequently the nurseries of idleness and ignorance than of industry and knowledge.

What was the state of the law before the Apothecaries' Act passed?—I am not well acquainted with the state of Medical Practice in England, previously to the establishment of this law in 1815; but I believe that those who received degrees or diplomas from the Universities, or the other Medical Schools of this country, were permitted to practise unmolested in the different towns and country villages of England, at a distance from London; the privilege of the College of Physicians extends to seven miles round London.

The whole of the Edinburgh graduates are excluded from practising in England, are they not, unless they have served this apprenticeship?—Yes; it appears to me, that the effect of this law must be to prevent all those who are well-educated for the Medical profession, by preparatory and professional knowledge, from becoming general practitioners in England.

Is there no other qualification required, but that of having attended an Apothecary five years?—Yes; there is one slight one, which I am just about about to mention. The Society of Apothecaries indeed, by their regulations, have prescribed a Course of Study, which must be pursued by all who apply for their diploma, and have pointed out the subjects on which they must be prepared to undergo an examination. With regard to these, it may appear sufficient to remark, that the Course of Study, which does not comprehend either Surgery or Midwifery, is contrived in so ingenious a manner, that students may run through it in a six months' residence in London; and that, besides Surgery and Midwifery, Anatomy also is omitted in the subjects of examination.

Is there no other qualification prescribed in the Apothecaries' Act?—No, I believe not; I would beg leave to mention the Course of Study which is required by the Royal College of Surgeons of this place, as compared with that which is required by the Company of Apothecaries in London:—The Royal College of Surgeons require "Separate and distinct Courses of Anatomy, Chemistry, Materia Medica, Institutions of Medicine, Practice of Medicine, and Principles of Surgery; attendance on a public Hospital for one year; Clinical Surgery during the attendance on the Hospital; Midwifery and Practical Anatomy. The above Courses must be delivered by Professors of Universities, or teachers properly qualified; *i. e.* by Fellows of the Royal Colleges of Physicians or Surgeons of London, Dublin, and Edinburgh, or of the Faculty of Physicians and Surgeons of Glasgow. The student must have spent at least *three* years in attending the above classes, the first six of which must be Winter Courses; that is, must comprehend the same period as those delivered in the University, commencing in October, and terminating at the end of April, and consisting of at least five Lectures in the week." The Course of Study required by the Company of Apothecaries is, "Two courses of lectures on Anatomy and Physiology; two courses of lectures on the Theory and Practice of Medicine; one course of lectures on Chemistry; one course of lectures on Materia Medica; six months at least of attendance at an Hospital, or nine months at a Dispensary, and an apprenticeship of five years." This course of study is framed according to the practice of the London School, of giving two courses of lectures during the Session, commencing in October and ending in May, each consisting of from three to four months in duration, and of lectures delivered twice, or at most thrice a-week. It is obvious, therefore, that the whole of the education required by the Apothecaries' Company, with the exception of the apprenticeship, may be gone through in one session, or, at most, in eight months. The Apothecaries' Act, then, would be sufficiently objectionable, if its only effect was to allow of licences to practise being conferred on individuals for whose proper education it makes so slender a provision. But when it is considered,

that by this Act the Society of Apothecaries is enabled to prevent individuals from practising as general practitioners, who from the course of their education must be supposed to be much better qualified than their own Licentiates, it cannot but be regarded as an intolerable evil. There is another effect which this Act is calculated to produce, and which is equally prejudicial to the public interests, and degrading to the Medical profession; it tends to throw a large share of the Medical practice of England and Wales into the hands of individuals whose emoluments depend on the quantity of useless, and too often pernicious drugs, with which they may be able to drench their patients. So long as the English public shall choose to foster this most absurd and disgraceful trade in drugs, which I believe is now very generally abandoned in this part of the kingdom, it is in vain to expect that Medicine can be practised upon scientific or rational principles. The Apothecaries' Act, then, so far from being adapted to effect its professed object, the protection of the public against ignorant pretenders and quacks, seems to me to be rather calculated to give to quackery its most obnoxious, because its legalized form. It is to be hoped, that when the Legislature shall next interfere with the subject of Medical education, it will not be for the purpose of conferring exclusive privileges on any one Corporation of Medical practitioners, but of directing that all of them shall prescribe such a course of preliminary and professional education, for those who may be desirous to obtain licences to practise Medicine, and of subjecting candidates for licences to such an examination as may afford a reasonable security to the public of their being qualified for the responsible duties which they undertake.

[*A Case for the Royal College of Surgeons of Edinburgh, in relation to the Apothecaries' Act, produced by the Witness, is printed at the end of his Evidence.*]

Do you understand that any plan has been proposed in London, for the purpose of bestowing exclusive privileges on any proportion of the Physicians?—I am aware that, at present, an association is formed for the purpose of resisting the right of the College of Physicians to call before them, and to examine graduates from the different Universities. I have seen a paper in circulation to that effect, of which I can furnish a copy to the Commissioners. One of the objects of this association, that is, the improvement of Medical education, and the more general employment of Physicians throughout these kingdoms, appears to be legitimate enough, but the other, I fear, is not so legitimate; it is intended to operate against the class of general Medical practitioners, who have not received University degrees. This association appears to me to be in quest of privilege, and they want to put a stop to the practice of Physic, by those who have diplomas only from the Colleges of Surgeons, or the Society of Apothecaries. They wish to reduce those who are at present general practitioners of Medicine, to be mere dispensers of drugs; in fact, Druggists. The effect of that would unquestionably be, to throw a monopoly of Medical practice into the hands of the Physicians, and to enable them to raise double or quadruple fees, if an Act of the Legislature could be obtained for that purpose. I have heard it suggested that it might be desirable to have two orders of Medical degrees in the Scottish Universities—a higher and a lower degree; and, provided the qualifications required of those who obtain the lower degree were such as to ensure a sufficient knowledge of their profession, to enable them to practise it with advantage or safety to the public, I see no objections to the conferring of additional University honours on those whose education or standing in the profession may entitle them to such honours. But I am satisfied in my own mind, after much reflection on the subject, that it is in the sufficient education of the class of general Medical practitioners, that the public has the best security for being provided with individuals qualified by their superior attainments to assist and advise their professional brethren in cases of danger and difficulty. The qualifications necessary for those who are to act as consulting Physicians and Surgeons must be the produce of extensive opportunities of practical observation, and of the industry and talent necessary for turning these opportunities to the best account. Neither the most extended course of University education that could be prescribed, nor the most rigid examinations that could be enforced, could ensure the acquisition and possession of such attainments, and certainly no University or Corporation privileges can confer them. The public must be left at liberty, with the benefit of such assistance as it may choose to receive from the Medical profession itself, to select, from among the general mass of Medical practitioners, those whom they consider to be best qualified by their attainments for the duties of the higher ranks of the profession; for any attempt to limit its freedom of choice in this particular cannot fail to be followed by the ludicrous result, that those who, in the eyes of the law, are the sole proprietors of a particular branch of practice, are very far from being so in reality.

According to the plan which you have proposed, how many years is that course of study to occupy?—Four. I have left one summer open, in order that it might contain any class that had been omitted, or any branch of education that might be suggested by others. I have not said anything about the third summer session.

Do you mean to propose that this course should be imperative?—Yes, I think it should be imperative.

Have you compared the order of study, which you have proposed, with that which is followed at Paris?—Yes, with most of those that are followed on the Continent. I have compared it with that which is followed in Italy, in France, in Prussia, in the Netherlands, and in Austria.

Does it not seem to differ from the course pursued at Paris?—In the names of the subjects more than anything else; they give different names to some of the branches of Medicine from those which we give.

It appears that the last winter of the Paris course is dedicated to what is called *Clinique Interne;* what is comprehended under that?—That is, the practice of Medicine, with attendance upon Clinical Lectures. They call the Principles of Physic and Surgery *Pathologie Interne* and *Externe.* The students of Medicine at Paris are obliged to pay much more

University of Edinburgh.

Dr. John Thomson.

26 January 1827.

attention to Clinical Medicine in the Hospitals, and it occupies a very considerable portion of their time.

Is the course which you have suggested, framed with reference to any division of the class of the Theory of Physic which may be thought proper?—It is. Though I have named Pathology as a class to be overtaken in winter, I am quite satisfied it were much better, in the event of that division being conceived to be proper, that the Pathology should be given during the summer session; and I am quite satisfied, and I have no scruples in repeating it, that I cannot conceive Medicine to assume a scientific form in this country, until that division is adopted. Until then, we must ever remain behind the Continent. One inevitable effect, I believe I stated the last time I had the honour of being before the Commissioners, has been, that we have not a single Elementary book, in the English language, upon Physiology, Pathology, or Therapeutics; whereas, in every school on the Continent, they have excellent text-books on these subjects.

How would you adapt that, or any similar course of study, to those who may have studied in other schools, in which the order of study may not have been the same?—I think there should be a power lodged with the Professors for that purpose. A few cases, in which there had been any deviation, would enable them to frame a set of regulations, which could be adapted at once to any given case. If the students had studied in private Medical Schools, there would at present be no difficulty, since attendance on the lectures of private teachers is not recognised by this University. If it were the case of an individual who came from the Continent, he would there have been obliged to study in a given order. For the students who come to study Medicine at this University, there is no course prescribed; and the effect of this is, that they take the advice of everybody, and a sort of struggle ensues between the admirers of the Professors in the University, and the friends of Private Lecturers; and the students are, in some cases, sent to University classes that are improper for them; and in others they are sent improperly to private classes, which are not suited to their state of education, merely out of a wish to promote the interest of the private Lecturers. This is one of the evils to which students, so long as there is not a prescribed course, will always be subjected.

Did you ever submit your views, concerning the mode of Medical study, to the Senatus Academicus, while you were a member of that body?—No.

Was any plan of Medical education proposed there?—Dr. Harrison's plan of Medical reform was discussed there, after I became a member of the Senatus Academicus. I took a part in that discussion. My opinions differed in some measure from those of the members of the Medical Faculty; but I believe that they were coincided in by some of the members of the Senatus, not members of that Faculty.

Was Dr. Harrison's plan generally disapproved of?—It was disapproved of upon several grounds. Dr. Harrison's plan extended the Medical Course to five years. The Medical Faculty declared themselves to be satisfied, from ample experience, that three years was a sufficiently long period for acquiring such a stock of Medical knowledge, as to qualify an individual for entering on the practice of Physic. That was one objection urged in the Senatus' reply to Dr. Harrison. A second was, that his plan made no provision whatever for a good preliminary education. These were, so far as I remember, the two main objections to Dr. Harrison's plan. I am happy to perceive, by the last edition of the *Statuta Solennia*, that the Medical Faculty have changed their opinion with regard to the first point.

Are there any documents extant concerning those discussions?—Yes; the answer of the Senatus Academicus is in the Minutes of the Senatus.

You stated there was an answer of the Senatus Academicus; to what had that reference?—I alluded to an answer to a letter addressed by Dr. Harrison of Horncastle to the Senatus. It was in the year 1806 or 1807, I think. Dr. Beddoes, in his Letter to Sir Joseph Banks (referred to in the printed observations which I took the liberty to submit to the Commissioners), makes an extract from the Senatus' answer, and makes great use of it, in commenting on the state of Medical education in the University of Edinburgh.

Does not the Course which you have proposed, comprehend not only four years' study, but four Courses of Lectures in summer?—I mentioned three Summer Courses. I have left one open.

Does not that amount to a great extension of the Courses?—Two Summer Courses more than are at present prescribed; but not more, I believe, than is taken by most of the students.

Do you propose that degrees may be taken during the fourth Summer?—Yes.

You suggested, at the former meeting of the Commissioners, that there should be Annual Examinations at the close of each session, of those who intend to graduate; but, with reference to the plan of study which has been pursued by those who come from other schools, would the examination, which would take place in the classes to be taught in the third year, of necessity imply a knowledge of the branches of Medical Science proposed to be taught in the two former years?—I think it were better, in general, that each annual examination should be confined as much as possible to the subjects taught during that session; but, if any doubts were suggested with respect to a student's knowledge of branches taught in a previous session, I certainly think he ought to be examined upon them. I am not aware that any great difficulty would arise from students coming from other schools. At present, unless they come from Universities, the classes that they have attended in other schools are of no avail whatever in the affair of graduation.

Will you proceed with any other observations you have to offer?—The next improvement that has occurred to me is, 10*thly*, That there should be some provision for the retirement of those members of the Medical Faculty, who may become unfit for the proper discharge of their duties. When Professors are considered unfit for the discharge of their duties, by accident, by disease, or by age, it seems very desirable that they, like those who are engaged in

517

University of Edinburgh.

Dr. John Thomson.

26 January 1827.

other departments of public service, should be permitted to retire upon a certain proportion of their incomes. This provision seems to be the more necessary for the members of the Medical Faculty in the University of Edinburgh, that their Professorships bring them little, if any other emolument, besides the fees of their students. In feeling themselves, therefore, unfit for the duties of their situations, they must either give up, without compensation, a lucrative office, or contrive to make privately the best bargain in their power, with the persons who have interest enough to be appointed their successors. I believe that serious inconveniences are liable to arise from this practice, and that it would be much more for the credit of the University, and the interests of the public, that those who find it necessary to retire, should be secured in the enjoyment of a moderate independency, by obtaining, according to age, length of service, and other circumstances, some fixed proportion of the profits of the Chair which they resign. On the other hand, it seems also to be extremely desirable, for the benefit of the students and the interests of the public, that some means were devised to induce Professors to retire from office, whenever it shall become evident to others that they are no longer fit to discharge with full advantage the duties of their Professorships. I am well aware how difficult it is to devise means for this purpose, applicable to the different conditions of all the Professors in the Scottish Universities; but the object is one which is highly deserving, I conceive, of the attention of the Commission. It has occurred to me, that this object, as regards the members of the Medical Faculty in the University of Edinburgh, might, perhaps, be attained, by allowing Medical students intending to graduate, to omit one of the classes enjoined by the Curriculum, and to substitute, in its place, attendance on a course of lectures on the same subject given by a private Lecturer. This permission, by the effects which it would have on the income of an incompetent or negligent Professor, would silently, but effectually, inform him of the time when he ought to retire from the University, and would hold out the strongest possible inducement to the Professors, and to Private Lecturers on Medicine, to exert their utmost endeavours to obtain and preserve the reputation of able, assiduous, and useful teachers.

Do you propose to invest the students with that power?—The Professor himself would be warned of his situation in the simplest possible way. I do not consider this proposal to be applicable to any other class of Scottish Professors, but it is applicable to the situation of the Medical Faculty in this University, from the amount of their fees, and from the great number of students who are obliged to attend them. For, supposing it shall become evident to the students, and to every other person in the University, that they cannot derive from the instructions of any Professor of the University, that advantage which they are entitled to receive, it is quite obvious that all that is necessary to be done is, that they should not be obliged to fee that Professor—who, in feeling the effects of this, would, in the course of a session or two, apply for retirement, and would be very glad to be permitted to retire, on the condition of receiving a certain portion of the emoluments of his class.

In what body do you mean to invest the power of allowing a Professor, so circumstanced, to retire from the University?—In the bodies from whom he may hold his commission. He might apply to his Patrons, whether the Town-council or the Crown, for permission to retire. I am sure the students will all take the University classes, unless there is some strong or valid objection; and if there were such an objection, I am sure they would make the proper choice.

Do you mean that, supposing such an option were given to students, to omit one of the classes, as soon as any great number of the Medical students omitted a particular class, it would operate as a broad hint to the Professor of that class to retire from the University?—Yes, I do.

You have stated that you were formerly Professor of Military Surgery in this University?—Yes.

Did you give a course of lectures within the walls of this University?—Yes.

Did you do so during the whole time you were Professor?—No; I lectured in the University, from 1806 until 1812; but I found it exceedingly inconvenient to lecture in the University from the want of a proper class-room. There was a class-room allotted for the Military Surgery and Clinical Surgery, in the new plan of the University; but it was to be a long time before it could be ready. I gave in a petition to the Town-council on the 6th of May, 1811, applying for leave to lecture in my own class-room, which was granted; and I continued to do so till I resigned that situation.

Did you attend the Military Hospital at that time?—No; I was appointed to the Military Hospital in 1815.

Does the attendance upon the Military Hospital necessarily go along with the Professorship of Military Surgery?—No; but I think Sir James Macgrigor would be very willing to throw the Military Hospital open to the students attending the class of Military Surgery.

Has the present Professor of Military Surgery the charge of the Military Hospital?—No; he has not any whatever.

Who has it?—It is a Staff-surgeon, who is changed from time to time.

Do you contemplate that the Professor of Military Surgery should prescribe to Military patients?—No; he could not.

How could he give Clinical Lectures?—He could give them upon the same plan as that upon which Clinical Lectures have been given in the Royal Infirmary on Surgery, for the last 32 years. He could not give the Clinical Lectures as the result of his own practice, but he could point out to the students attending them, the different diseases occurring in Military Hospitals, and the modes of practice that are adopted there. The students would see the manner of drawing up Reports, and of keeping the Hospital Records, which would be highly useful to young men entering into the service of the Army and Navy.

Did you ever hold any other Medical appointment in the Military department?—I was for

University of Edinburgh.

Dr. John Thomson.

[26 January 1827.

a short time attached to Lord Moira's staff in 1803-4, and received afterwards the Commission of Staff-surgeon while in Belgium, after the battle of Waterloo.

For what length of time did you hold that appointment?—About six years.

I beg leave, before retiring, to lay before the Commission the heads of a Lecture on Medical education, which appears to have been delivered by the late Dr. Cullen, while Professor of Chemistry in this University, the original MS. of which I have found among his papers, in his own handwriting. They are the following:—

"*Of the Study of Physic.*

"The Study of Physic seldom properly conducted.

"The Universities prescribe no rules to direct.

"Students come uninformed, and their various circumstances occasion great irregularities.

"I have often been asked to give my opinion, and I take this opportunity.

"If it were possible a genius should be chosen.

"A knowledge of languages; a familiar acquaintance with Latin, and at least a moderate with Greek; French is at present necessary, and the other modern languages useful.

"Study of Belles Lettres.

"Logic and Metaphysics; Mathematics and Natural Philosophy. Disputes about their utility: this pushed too far, and has had little success; but though it does not go so far as once imagined, still necessary in many respects.

"The question connected with that about the Theory of Medicine, and then to be discussed.

"It is necessary, and time should be allowed for it as a preliminary.

"N. Philosophy consists of two branches, the Mechanical and Chemical: the first in the schools of Philosophy, the second, unhappily transferred to those of Medicine. It is my own branch, and I should have no improvements to make in it, but there are many. It is a part of Philosophy, a preliminary study, and should be treated as such.

"When finished, another preliminary study, that of Natural History, to be entered on.

"Chemistry is necessary to Fossils.

"Botany may [be] taken at any time, but the sooner the better.

"Zoology may be entered upon by itself—as the insects—but the most of it will fitly succeed the Anatomy. It affords the Comparative Anatomy.

"Instructed in Natural Philosophy, Chemistry, and Anatomy, a student is to proceed to the Institutions, the general doctrines, the Theory of Physic.

"False notions on this subject. Disputes about the use of Theory. It has been abused, it still is, and much of it is hurtful; but some parts useful, and a full discussion necessary; suitable to young, and at least by them to be indulged; but always with diffidence.

"The Institutions consist of three parts, Health, Disease, [and] Means [of Cure.]

"The first (Physiology) occupy our students.

"The second (Pathology) is repeated in the practice, but should be taken more generally; and our Professor thinks so.

"The third part (Therapeutics), still slightly touched in the Institutions, supplied by the Materia Medica.

"This (Materia Medica) has been improperly placed, but requires Natural History, Chemistry, and Theory of Medicine.

"It has been improperly taught, but now more properly as a *Methodus Medendi.*

"Now instructed in the preliminary studies, and the general doctrines of Physic, he proceeds to particulars, or the study of the Practice."

Case for the Royal College of Surgeons of Edinburgh, in relation to the Act 55 *Geo. III. chap.* 194, *commonly called the Apothecaries' Act.*

The Royal College of Surgeons of Edinburgh, by various Royal Charters granted in their favour, and confirmed by sundry Acts of Parliament, are empowered to grant Diplomas in *Anatomy, Surgery,* and *Pharmacy.*

The Royal College have not only been most careful in conducting the examination of candidates for their Diploma, but have also prescribed a Course of Study to be observed by all candidates previous to their being admitted to such examination. The Royal College have been most desirous to render their prescribed Course as complete as possible, in order that it may keep pace with the progressive improvement of Medical Science.

From the attention of the College to this important duty, their Licentiates have not only obtained the confidence of their countrymen in civil life, but also the notice and approbation of the Medical departments of the public service. Their Diploma is received as a qualification in the Medical service of both Army and Navy; and it may be mentioned that many of the most eminent Medical Officers in both departments are Licentiates of this College.

Previous to 1815, the Diploma of this College was held as a qualification to practise Surgery and Pharmacy throughout the United Kingdom; but in that year an Act was passed, by which all persons, whatever may be their qualifications, are prevented from practising as Apothecaries in England and Wales, unless they shall be licensed by the Apothecaries' Company of London.

The avowed purpose of this Act was to protect the public from ignorant pretenders and quacks; but its real effect has been also to interrupt, in the exercise of their profession, persons the most highly qualified.

Apparently, the Act only confers on the Company the exclusive privilege of licensing *Apothecaries;* but it is well known that, under this denomination, are included nine-tenths of the country practitioners in England. It is only in large towns that the different departments of the Physician, Surgeon, and Apothecary are, or can be, kept separate. In other places it is absolutely necessary for every practitioner to dispense drugs. Hence the enactment goes much farther than could have been intended by the Legislature, as it really confers on the Apothecaries' Company a monopoly of licensing all the country practitioners in England and Wales.

University of Edinburgh.

This Act was passed so hurriedly, that the Royal College was not aware of it until it was too late to petition Parliament against it.

In the last Session a Bill was introduced to supply some defects in the Act of 1815; but this Act of Amendment was limited to one year, in consequence of the numerous complaints against the original Act; and it is understood that an inquiry will be made into the merits of the subject during the approaching Session of Parliament.

The College of Surgeons of Edinburgh are willing to rest their claims in this matter on a comparison of the Course of Study required of candidates for their Diploma, and that required by the Apothecaries' Company. The two Courses are printed as an Appendix to this Case; and in comparing them it will be observed, that while the College require, at least, *three years study* at some University or School of Medicine of reputation, the whole Course prescribed by the Apothecaries (with the exception of the apprenticeship, to be afterwards noticed) may be gone through in *one year*. It is also to be noticed, that while the Course prescribed by the Royal College comprehends *all the branches* stated in that required by the Apothecaries, including *Pharmacy*, the Course prescribed by the Apothecaries' Company omits two most important practical branches—*Surgery and Midwifery;* nor is any notice taken of these in their examinations.

The only distinct and specific requisite demanded by the Apothecaries' Act, in those who are to be taken on trial for a Licence by the Apothecaries, is, that the candidates shall have served a five years' apprenticeship to an Apothecary.

This enactment is beneficial to the practising Apothecary, as it procures him a supply of apprentices to do the business of his shop; but it is injurious to the Medical student, by occasioning a waste of much valuable time, which could be far more profitably employed. In places which are the seats of Medical Schools and Hospitals, apprenticeships of a moderate length may be useful, as the student may enjoy, in the course of them, many other opportunities of improvement; but in other situations they are positively hurtful, as they shut out the student from all such opportunities; and in such situations they may be stated to be the very worst and most inefficient means of communicating instruction.

Some of the injurious and even absurd effects of the Apothecaries' Act of 1815 may be stated in a few words.

It prevents from practising, not only the Licentiates of Royal Colleges whose Diploma extends to *Pharmacy*, but the graduates of Universities, and if such a case could be supposed to occur, the Professors in such Universities, unless they are licensed by the Apothecaries' Company.

It prevents from practising those who are qualified to hold, and even those who have actually held, Commissions as Surgeons in His Majesty's Army and Navy, not one of whom, by the original Act, could dispense a single drug in the remotest village in England, without being licensed by the Apothecaries' Company.

To conclude, this exclusive right is conferred on a class of persons whose medical education is comparatively imperfect, while those possessing the highest qualifications are excluded, unless they will submit to pay certain fees, and be examined by a body of men who are their inferiors in professional qualification.

The College are acquainted with many instances of the interference of the Apothecaries' Company with their Licentiates settled in England, whose knowledge and acquirements had recommended them to an extensive practice. In a late instance they threatened a prosecution against one of the Licentiates of the College, whose practical opportunities had been more than usually extensive, he having acted as House Surgeon of a large Hospital; and whose education, which was full and complete, had been conducted under teachers of the first eminence in the profession.

The Royal College, therefore, confidently trust, that this injurious monopoly of the Apothecaries' Company will be abolished, and that the practice of the profession will be thrown open to all who, like their Licentiates, possess proper testimonials of professional ability, ascertained by examination, and secured by a proper course of preliminary education.

Edinburgh, 6th February 1827.

HENRY HOME DRUMMOND, Esq., M.P., in the Chair.

William Henry Playfair, Esq, called in and examined.

W. H. Playfair, Esq.

6 February 1827.

Do you act as Architect for the Buildings of this University?—I do.

Have you any appointment as Architect for the University from the Commissioners for building the College?—When the Commissioners first began this building, they appointed me to act as their Architect.

When was that?—Towards the end of the year 1816.

Have you continued to act as Architect from that time to the present?—Yes.

Do you receive an annual salary for that?—I receive a per centage upon the outlay on the buildings.

What is the amount of it?—Five per cent.

Are the buildings nearly completed?—They are.

Is it the Library which principally remains to be done?—The Library, and the lowering of the Court, and the Dome, are the three great objects which still have to be executed.

Will you be so good as to state, shortly and generally, what remains to be done to the Library?—We have to plaster the whole of it; to put up all the book-cases and wood-finishings; to heat it and to furnish it.

Are there not some rooms, in the same building with the Library, still unfinished, particularly the Graduation Hall, for assembling the University to confer degrees?—The plaster work of the Graduation Hall is nearly finished. The wood work is all cut out, and ready to be fixed up, so soon as the plastering shall be completed.

What is the sum that will be requisite for finishing the Library and the Graduation Hall?—According to a statement I lately made to the Commissioners for building the College, it will be £8,686, not including the last instalment, which has to be paid to the contractor, amounting to the sum of £2,875.

Is any part of that sum provided for by money now in hand?—There is. When the Com-

University of Edinburgh.

W. H. Playfair, Esq.

6 February 1827.

missioners shall have discharged the contract for the Library, and paid all their outstanding engagements, they will still have upwards of £4,000 to meet the demand for £8,686.

Was there not an understanding last year, when the sum of £10,000 was granted by the House of Commons, that a further sum of £6,000 should be afterwards granted?—There was.

Are the Commissioners to understand that £10,000 has been received, and that £6,000 remain for this present session to grant?—They are.

With that £6,000, then, will there not be upwards of £10,000 to be laid out in the College Buildings?—There will.

At the time the plan for the internal arrangements of the buildings of the College was adopted, was there any report by the Senatus Academicus of the number of Class-rooms wanted, or was there any minute of the Commissioners for building the College made, fixing the number of class-rooms required for the purposes of the University?—There was a circular issued by the Senatus Academicus, and given to the several Architects, who made out plans, and in that circular each Professor stated what he considered would be sufficient for his own accommodation. I presume copies of that paper must still be in the possession of the Secretary, who furnished it to the Architects. The Commissioners, in approving of my plan, assuredly approved of a certain number of class-rooms; but I know nothing about any minute to that effect.

Are the Commissioners to understand, then, that the way in which the business was done, was this, that your plan had reference to the statements furnished you by the Senatus Academicus, and that your calculations were made with regard to that, before the Commissioners for building the College had fixed upon any particular extent of accommodation, which they conceived to be necessary?—Precisely.

Do you mean that this Circular was sent by the Senatus Academicus, to the Architects directly, or that it was transmitted by the Commissioners for building the College to them, as the Circular of the Senatus Academicus?—I cannot recollect exactly; but the impression upon my mind is this, that any Architect, who wished to acquire information on the subject, and who was going to send in a plan, made application to the Secretary of the Senatus Academicus, Dr. Duncan, who gave it to the person so applying.

Would it not appear that, in point of fact, the extent of accommodation, and the propriety of it, were not regularly a subject of consideration by the Commissioners for building the College, until the merits of your individual plan, framed on the information you have now stated, came to be considered?—I think it would so appear.

In making out your plans, were there no directions given by the Commissioners for building the College to you, to provide separate class-rooms for each Professor?—Certainly not; my information was derived entirely from the source I have mentioned.

Your plans—as the plans of all other Architects, in similar circumstances, must have been—were framed with reference to the information so acquired?—Most distinctly.

Were you empowered by the Commissioners, if a Professor reported to you that such and such accommodation was required for his class-room, to decide upon the propriety of giving that accommodation, further than the space allotted to you, within which the building was to be placed, in a manner enabled you to do?—No. I first came in contact with the Commissioners when they had approved of my plan. An advertisement was put into the newspapers, stating that the College Buildings were to be finished, and that Architects might come forward and produce plans for their completion. They were allowed to apply to the Secretary of the University for any information that was necessary to form their plans. The plans thus made out by different Architects were sent to Sir William Arbuthnot, then Lord Provost, in whose possession they remained a short time. Then, I presume, they were examined by the Commissioners, and afterwards ordered to be hung up in the City Chambers for the inspection of the public, in order that every one might judge of their relative merits. Considerable discussion arose as to whose plans were the best; and it was thought by the Commissioners that the best plan of arriving at the truth was to send the drawings to the Senatus Academicus to be examined and reported upon. They were accordingly sent to the Senatus Academicus; and the Professors, with the exception of three, reported that the plan made by me was the best, both as relating to the accommodation for themselves, and the general wants of the University. It was in this way that the matter was conducted.

Looking to the extent of accommodation necessary for the Library and Museum, and speaking from the knowledge you may have had of the accommodation actually required, if you were now to make the plan over again, would you allot so large an extent of the building to the accommodation of the different class-rooms?—Most distinctly; I would, most decidedly. I could show, by reference to the plans, that the whole of the class-rooms are usefully occupied during the day, and that, with the exception of one small room, not one of them could be dispensed with. It is in consequence of the interlacing of different lectures one with another, that more class-rooms are required than might, at first sight, appear necessary. Most of the Professors are obliged to lecture at certain fixed hours, to accommodate each other; and it is in order to avoid the confusion of students meeting in the staircases, and to procure good ventilation, that several class-rooms are provided.

You have alluded to various reasons, and you have mentioned one connected with the ventilation of the rooms; are there any others that you can mention?—No other; that of ventilation is a strong reason. It is evidently impossible for a Professor to lecture during one hour in his class-room, and that the same class-room should be occupied by another Professor in the hour immediately following.

If there are any of the class-rooms not occupied during the day, after the lecture is over early in the forenoon, or early in the morning, might not such rooms be occupied again during the latter part of the day?—Not as the hours of the classes are now arranged. The only way

University of Edinburgh.

W. H. Playfair, Esq.

6 February 1827.

in which I could convince the Commissioners upon that subject, would be by referring to the plan. There are certain classes which must have a lecture-room appropriated to themselves alone, being those which have apparatus: for instance, it is evident that the Chemistry class can be occupied by only one Professor. The Anatomical theatre, the Natural Philosophy class, and the Natural History class, for the same reason, require separate apartments. There remain, therefore, on the second floor, the Moral Philosophy, Logic, Civil and Public Law, Oriental Languages, and the Church History Class-rooms, and the Divinity Hall, in which more than one Professor might lecture, if it were thought necessary. The Professors of the Practice of Physic, and of Scots Law, lecture in the same apartment. The Practice of Physic meets at nine, the Scots Law at three; consequently there is a great interval during which the room is unoccupied: but it will be seen, by a reference to the plans, that the Lectures upon the Theory of Physic are delivered in a very small class-room, capable only of containing 137 students, although nominally the class consists of upwards of 250. The Professor of that class is Dr. Duncan, senior, a gentleman far advanced in years. It is evident that the students, although they cannot take out degrees without nominally attending it, do not attend it, in fact, regularly, the room being incapable of holding them. Dr. Duncan is extremely unwilling to quit this class-room; but it is evident that, when he shall cease to lecture, Dr. Alison will require a larger room; and he could well occupy the Practice of Physic Class-room from eleven till twelve. The Professor of Mathematics requires a room to himself. He lectures from nine till one, with some intervals; and he is frequently obliged to draw diagrams upon his boards, which remain from one day to another. If the students of another class were admitted, they might interfere with this arrangement. The Professors of Latin and of Greek lecture from eight till three, with some intervals; consequently each requires a separate class-room. The Professor of Materia Medica exhibits a number of experiments, and, with his assistants, is frequently occupied during the day in making preparations; and consequently his class-room can be appropriated to no other purpose. This small class-room is the only one remaining to be disposed of upon this floor.

Is there not a Laboratory and an Apparatus-room attached to the Professorship of Materia Medica?—Yes.

Does not that contain the preparations which are exhibited to the students?—Yes. But the Professor of Materia Medica has occasion to prepare materials for the next day's Lecture, by placing apparatus upon the table; and this arrangement would be interfered with, if another Professor lectured in the same room. The Professor of Moral Philosophy lectures from 12 till 1, in this apartment, and the Professor of Conveyancing from 2 till 3; and the Lectures upon Clinical Surgery, which are now delivered by Mr. Russell, in the Infirmary, might, if it were thought necessary to give a course of Lectures on that subject within the College walls, be delivered there from 5 till 6. It is evident that the class of Moral Philosophy could not meet in the class-room of the Practice of Physic.

Could it not meet in the Logic class?—The Professor of Logic lectures from 1 till 2, and the Professor of Moral Philosophy from 12 till 1; consequently, there would be no hour intervening between the lectures, which must always be the case. It will be found, that the Logic class could not be transferred to any other room, in consequence of the interference of the hours. The Professor of Civil Law lectures from 3 till 4. There are no lectures given on Public Law; but this class-room is provided for them, in case the Professor ever should lecture.

Are there any rooms for Professors attached to the different class-rooms, excepting those that are Laboratories or Model-rooms?—There are retiring rooms for the different Professors in many cases.

Are they in addition to such rooms as are required in the Chemical class, or the class of Materia Medica, or the Laboratories?—Yes.

Are these rooms ever used, do you understand?—I understand they are, and that they are found of great use.

When a Professor delivers only one lecture in a day, what use does he make of his retiring room?—The Professor uses his retiring room as a quiet place, in which he can arrange his thoughts for his lectures; and also as a repository for his books and papers, which it would be inconvenient to remove backwards and forwards from his house.

In the arrangement for the Library, is it proposed to have merely one very large room, or are there to be separate apartments?—There are to be separate apartments. The lower part of the Library is arranged in such a manner as to allow the books which are in constant use among the students to be delivered with rapidity and ease. The students, entering at a separate door, pass through the lobby, and arrive at what is called the Students' Hall. This Students' Hall is divided from the lower, or working library, by a small partition, in which partition there are intended to be four or five wickets. When a student wishes for a book, he knocks at a wicket, which is opened by the Librarian, who stands within, and receives the paper containing the name of the book the student wishes to have. The Librarian then searches among the books placed in the lower library, and, if the book be there, he gives it to the student, he remaining in the Hall. It is considered that, by this arrangement, students will procure a book with more facility than if they were allowed to go among the catalogues themselves, and converse with the Librarians as they formerly did.

Are there to be any books in the Students' Hall?—None.

You think it would not be expedient that students should be admitted into the places where books are?—Not in the lower library where the bookcases are to be without doors, and where they might easily derange the books.

Is it not the case, that students are detained an hour and a half, and sometimes two hours,

University of Edinburgh.

W. H. Playfair, Esq.

6 February 1827.

before they can get the books they want?—I have heard it said so; but I scarcely ever go into the Library, and I do not know it to be the case from personal observation.

How many wickets is it in contemplation to have?—It is not yet determined. There might be five, or even seven, if it were found necessary; but that would require an additional number of assistants, a demand which the funds would not meet. I think that three would probably be the proper number of wickets.

Supposing students to be detained for the length of time that is alluded to, is there not a risk, if they are kept in this outer hall, they may go off without waiting for their books?—No doubt.

Are any arrangements made by which students can be allowed to read in the Library?—Only in case of consulting expensive books, which are not allowed to be sent out from the Library. A large room is provided, entering from the Students' Hall, to which they are to have access.

Is it intended that the Library should not be fitted up, so that a number of persons may be reading, and prosecuting researches there?—There are spaces which I have not yet described, that may be fitted up for that purpose, and which might be used to much advantage in that way.

Are your instructions to fit it up in such a way, that those recesses can be used in that manner?—I have received no instructions on that head.

Is it part of your plan to fit them up in that way?—It is my wish to put tables at each window, on each side of the great room, so that a person wishing to read, might do so.

Was the arrangement as to the Working Library, to which you have alluded, the result of your own consideration of the subject, or suggested by the instructions and opinions that may have been expressed to you by the Librarians, or the Senatus Academicus?—It was the result of conversations I had with Dr. Brunton, the Librarian, and with the under-librarians. The arrangement was founded upon the information so obtained.

In the arrangements that you made, the Commissioners are to understand you consulted, what appeared to be the most approved plan for a Library among the Librarians?—Distinctly.

Had you taken occasion to inform yourself as to the construction of other Libraries, previous to your forming your plans for this?—Before I contrived the plan of this Library, I visited Oxford, Cambridge, and London, but I could institute no comparison between the Libraries there, and that part of the Library which I have been describing, for the English Libraries are differently constituted, and the books are not given out at all.

As to the construction of the Library, although the plans are formed under the direction of the Commissioners for building the College, was it understood that, in that matter, you were to be guided by the wishes of the Senatus Academicus, or the Librarians, or was the principle of the plan approved of, in any way whatever, by these Commissioners?—It was. Having endeavoured to procure information from every source, in Oxford, Cambridge, and in London, and from the Librarians here, it became necessary to make out the plan of such a Library, as I thought best suited to the wants of this University. This done, I submitted the plan to the Commissioners, and explained my views upon the subject, which they approved of.

How many persons can be conveniently accommodated in the outer-room or Students' Hall, connected with the Working Library?—I never made any calculation upon that subject; I cannot answer the question.

Is it to be seated?—That is not yet determined.

Will you describe the Upper room?—A person wishing to visit the Upper Library ascends the great staircase, and arrives at the landing. There is a large folding door at the end of the Library, which conducts into a sort of ante-room, surrounded by Ionic columns, which support the entablature, and a flat ceiling, in which there is a horizontal skylight. Beyond the ante-room is the main body of the Library, which extends 150 feet in unbroken length. It is lighted by windows, equally disposed on each side; and between these windows there are placed a sort of buttresses or pilasters, projecting into the room, and supporting the entablature and the arched ceiling above. On each side of these buttresses are inserted the bookcases. The windows I have alluded to, light the lower part of the room; and above the tops of the windows there is a broad gallery, to which there is access by staircases, situated at each corner of the apartment. The space between the gallery and the entablature is filled with book-cases, there being no windows; each of the small recesses, formed by the buttresses, being lighted by a horizontal skylight. At the other end of the room there is another assemblage of Ionic columns, forming a small apartment similar to the ante-room.

Is it in the spaces between those buttresses you would propose to place the tables for reading?—Yes.

If the students are not to be admitted to read, of what use will that vast number of tables be?—When I stated that the tables were to be placed there, I should have mentioned, that I cannot say so positively, no such arrangement having yet been sanctioned by the Commissioners.

If the room shall be so fitted up with such opportunities of reading, and the students are not admitted into the Library, must not that accommodation necessarily be thrown away?—Completely thrown away; but I think they might be admitted with great propriety.

Is it proposed that the books in the Upper Library shall be kept under lock and key?—It is.

So that the student will only be able to get the book given out to him, which he requires at the time?—He will only be able to get the particular book that he requires.

Taking in the whole extent of the accommodations upon both floors, which you have been

University of Edinburgh.

W. H. Playfair, Esq.

6 February 1827.

so good as to describe to the Commissioners, what number of books do you think the Library will be calculated to hold?—It is exceedingly difficult to answer that question with precision. I have conversed with the Librarians upon that point, and they tell me they believe there are about 65,000 volumes in the present Library, as nearly as they can calculate, and that it is increasing at about the rate of 1,500 volumes per annum. In order to arrive at a just comparison between the capacity of the new Library and that of the old one, I measured the superficial contents of the bookcases of each, and I found that, if the old Library holds about 65,000 volumes, the new Library will contain about 110,000 volumes.

Will not the Library be more than doubled in 50 years, according to the present rate of increase?—Yes.

Supposing any other funds to be appropriated for the increase of the Library, or the source of the present funds to turn out more profitable to the College, can there be any provision made in any other part of the building, for a more rapid increase of the Library?—I think the Graduation Hall, which is 30 feet by 70, could be fitted up with bookcases, with great advantage, and with little additional expense.

Does that adjoin the Working Library on the floor underneath the large Library?—Yes.

Is it intended to apply the Graduation Hall to any other purpose besides that of conferring degrees annually?—It is. It is considered by the Librarians a great object to keep every body, Professors as well as students, from the Lower Library, where the books, being unenclosed by doors, might be easily displaced, and the whole thrown into confusion. The Lower Library is to be considered as quite sacred, no person going into it but the Librarians. A Professor wishing to get a book from the Lower Library, will go into the Graduation Hall, where there is to be a wicket or door, through which he will apply to the Librarian for the book he is in pursuit of—he, the Professor, remaining in the Graduation Hall, and which is to be considered as a Reading-room for the Professors.

Suppose a student wishes a book that is not in that Working Library, in what way is he to obtain it?—There is a staircase at the end of the Lower Library, which communicates with the upper floor and the gallery, and by which the Librarian has access.

Does he obtain it at the same wicket?—Yes.

But will there not be a considerable difference in the trouble to the Librarian, according as the students happen to want a book, which is, or is not, in the Working Library?—A great difference.

Supposing a Medical student, or a student in the Natural Philosophy or Moral Philosophy class, prosecuting a subject of interest, should wish, in consequence, to consult a number of books, and might be sorry to take them all away (which, perhaps, would be a detriment to the Library), in what way, according to the arrangements upon which you were directed to frame your plan, is he to attain his object?—He would be admitted into the Consulting-room, which is set apart for that purpose, and the books would be brought to him there. It is a large room, 21 feet by 40.

In what way are those who wish to use the Consulting-room, to be separated from the larger body of the students, waiting for ordinary books, who are not to be allowed to use it?—By a door. If the student wish to go into the Consulting-room, he knocks at the wicket, and tells the Librarian he wants to consult an expensive work, which is not allowed to be sent out from the Library. The Librarian desires him to go to this door, which he opens from within, and the student remains in the Consulting-room, the door being fastened in the inside; or these works may be consulted in the Upper Library, if thought right.

Is it understood that the students are not to be supplied with any books from the Upper Library?—By no means; that is not understood.

Supposing any of the assistants of the Librarians, to whom so many applications may be made in the course of the day, choose to be indolent and inattentive, and do not go up to the Upper Library to look for the books, can the student in any way know whether they have truly looked for the book, or whether they merely, through the wicket, report that it cannot be found?—He cannot know.

In the course of the consideration you have bestowed upon the plans for the Library, have you had occasion, or was it at all necessary for your purpose, to see how the system at present practically works, and how the books are given out, so as to judge of the facilities that are given to it?—Yes. I went up to the large room, which is fitted up in a somewhat similar manner; and, upon looking at the wooden wicket, I found certainly that there was sometimes a considerable crowd around it; but the students appeared to get the books which they asked for, and there was great activity among the Librarians; but this activity evidently depends upon the character of the individuals, and not upon the check the students may have over them. I certainly do consider, that, if the students had access to the catalogues, and were allowed to converse with the Librarians freely, it would interfere with business, and would render it difficult to get out a book quickly. The young men at College are sometimes mischievously inclined, and somewhat noisy, and the catalogue would be speedily destroyed. This is not like the Library belonging to the writers to the signet, which is frequented by men, whose time is of value, and who are more advanced in life. I certainly think that some line of separation might be adopted with advantage in the College Library—not that I am by any means an advocate for shutting out the students from the Upper Library. Probably, an increased number of wickets might be sufficient.

It is not proposed to make a distinction between the students attending different classes, is it?—Not that I know of.

Are the whole of the students equally restricted to getting books through these wickets while they are in the Students' Hall?—Yes; but if the wickets be objected to, it would be perfectly practicable to construct a broad table, like a banker's table, and which would be a

University of Edinburgh.

W. H. Playfair, Esq.

6 February 1827.

line of separation between the Librarian and the students, who would then see what was going forward.

Has there been, at any time, a catalogue of the College Library published?—There never was a printed catalogue that I know of.

Where is it proposed that all the new publications are to be put?—I do not know that. Those new publications which will be in daily use will be separated, and put into the Lower Library; and the others will be placed in the Upper Library, according to the general principle.

By the new publications, do you mean new editions of those books which are supposed to belong properly to the Working Library?—Yes, or duplicates of them, such as Cook's Voyages, &c., which are frequently asked for, and elementary books upon Chemistry, &c. &c.

Had you any opportunity of observing whether students complained or murmured at the mode of getting books?—I had no opportunity of observing that. I have observed nothing of the kind.

Did they appear to be kept long?—Certainly not, when I was there.

Is the accommodation for the Museum now entirely exhausted?—Entirely exhausted.

Supposing that a different arrangement, in regard to the hours at which some of the classes meet, could be introduced, so as to enable more to meet in some of the class-rooms, is there any portion of the building which, without any great expense, could be appropriated for the increasing collections of the Museum?—There is, no doubt. If the seats of some of the class-rooms were taken out, such rooms would hold a number of objects; but they could not probably be advantageously displayed from the light not being so good as might be wished.

Would the room that is now occupied by the Professor of the Practice of Physic be most conveniently applied for that purpose?—No. There is a great want of light in consequence of the buildings approaching very near it. The houses are close to it on the western side; the street rises above it, and it is, in consequence, rather dark, even for a lecture-room.

Are the buildings, on the opposite side of the street, nearer this part of the College than those opposite the present Museum?—There are none opposite the present Museum. The Commissioners have acquired the property there, and have pulled down the houses to improve the light.

Is it only opposite the Anatomical Museum where these buildings are?—Yes; but it has a northern light also.

There is a room marked Natural History Preparation Room; is that so occupied at present?—Not entirely; it is used also by the Wernerian Society, of which Professor Jameson is President.

Is that done under the authority of the Commissioners?—I do not know if any application has been made to them; I apprehend not. It is used also as a Preparation-room, when the Society does not meet there.

How is the Preparation-room fitted up?—It is a long while since I was in it, but when I last saw it, there was a table in the centre, and some benches placed round the walls. The table was covered with a variety of Minerals, which Professor Jameson was preparing for the Museum.

Are those benches for the accommodation of the Wernerian Society?—Yes.

Are they the property of the Society?—I do not know.

In the course of the opportunities of practical observation, which you stated you availed yourself of, did you observe how the books were given out in the present Library, or had you at all the means of perceiving if the younger portion of students, attending the Latin and Greek classes, asked merely for books limited to the particular subject of their classes?—No, I did not pay attention to anything of that kind.

Does your observation, in regard to the impatience and noise of some of the students, apply chiefly to the younger portion of students?—Yes; but I speak chiefly from my own recollection when I was attending College, much more than from recent observation.

Might not that lead to some different system of distribution, according to the class of students attending?—It must be extremely difficult to separate one set from the other. I do not know how it could be done.

How many volumes will that Working Library contain?—I cannot tell at the present moment.

May it contain 20,000, do you think?—I should think it would, certainly.

There are two rooms, one large reading-room, and the other a retiring-room, communicating with the Students' Hall; are they intended for either the students or the Professors to occupy as reading-rooms?—They are for that purpose.

Does it appear to you, that the small rooms adjoining the several classes might be advantageously fitted up with book-presses, containing books to be given out under the direction of the Professors?—I do certainly: it has been done in one instance by Mr. Pillans, with great advantage.

Might the use of the Class Libraries, in part, supersede the necessity of the mode of delivering out books to the junior students in the General Library, which you have explained?—I should suppose it might, to a certain extent.

What accommodation is intended to be provided for the Theological Library?—There are apartments provided over the entrance-gate at the eastern front, separated entirely from the other Library. These are intended to be fitted up for the reception of the books, as they shall gradually accumulate.

Do you happen to know how many volumes, at present, are contained in that Library?—I do not.

At what rate is the collection annually increasing?—The last time I inquired, I think that there were 10,000 volumes; but I do not know the rate at which they are increasing.

University of Edinburgh.

W. H. Playfair, Esq.

6 February 1827.

What number of books will be accommodated in these rooms?—I have not made a calculation, but greatly more than at present; I could not precisely say what number.

Is it intended that the books in the Theological Library shall be applied for in the same way as in the other Libraries, at wickets; or has any arrangement been made for that purpose?—No arrangement is yet made that I know of. This has been left entirely to the Theological Faculty to arrange.

Is this Theological Library, or the apartment for it, actually at present fitted up for the reception of books?—A part of it is; and a part of it is also appropriated to the books of the old Library. We have been obliged to pull down a part of the old Library, to make way for the new buildings; and, to accommodate the books which have been thereby displaced, we have fitted up, in a temporary manner, part of the Theological Library.

Then the expense of fitting up what is still wanted for the Theological Library must be added to that sum which you have mentioned as necessary for the fitting up of the other Library?—It will.

Can you state, generally, what sum will be required for that purpose?—About £800.

How long is it since the Anatomical Museum has been fitted up?—The Anatomical Museum was finished in the course of the last three or four months.

Was that done at the expense of the Town?—At the expense of the Commissioners.

Did it form originally a part of the Anatomical Theatre?—Yes, originally.

Was the Lecture-room of the Professor of Anatomy made, originally, to extend from the top to the bottom of the building?—Yes.

Is the Anatomical Museum constructed out of the lower part of the Anatomical Theatre?—It is.

Is the Anatomical Theatre now better adapted for its purpose than originally?—It is decidedly better lighted, warmer, and better adapted for hearing.

Was there not considerable difficulty in seeing and hearing formerly in the Anatomical Theatre?—There was very great difficulty, the skylight being nearly sixty feet above the body to be dissected.

Is there still ample accommodation for the students in it?—Yes. A gallery only has been removed, which never was made use of, from its inconvenience.

Is the whole expense of constructing the Anatomical Museum defrayed?—Not entirely.

What remains to be done?—There remain some cases, which are to be placed in the centre of the apartment, and some trifling articles of furniture.

What is the amount of the sum which is wanted for that purpose?—About £500.

Are the different sums which you have mentioned all that will be required for the final completion of the building?—They are not.

What other sources of expense remain?—There is, to the execution of the dome or spire over the entrance-gate, £4,750. 8*s*. 8*d*.; to the clock, £300; and to complete the supply of water, £60; to iron railings and gates, which are required to enclose the buildings, £900; to various extras and additions to the southern building, £945; to various particulars required to complete part of the buildings, foot-pavements, lamps, and for fitting up necessaries for the students, £900. These are the principal items which were laid before a meeting of the Commissioners for building the College, at their meeting on Saturday last.

What is the expense of excavating the Court?—That is included in the £8,686 required for the Library, and which I have before mentioned.

What is the total wanted, over and above the sum of £4,000 now in hand?—The total sum which we want is £16,889, over and above the £4,000 which we have now in hand; that is to say, £10,889 more than £6,000, which we have reason to believe we shall get from the Treasury this year.

Is any part of the building, according to your plan, destined to the purpose of Religious Worship?—It is understood, that if Divine worship is to be held within the walls of the College, the Graduation Hall may be applied to that purpose.

Is it capable of being conveniently applied to that purpose?—Not to a great extent.

How many persons might be accommodated there for such a purpose?—I should presume from 700 to 800.

All sitting on the same level?—Yes.

At a Meeting of Commissioners, at Edinburgh, on Thursday, 10th May, 1827.

Dr. TAYLOR in the Chair.

[There not being a quorum of Commissioners, those present proceeded to take into consideration the following Complaints made to the Commission:—1*st*, The Petition by a Committee of Divinity Students of Edinburgh, in regard to the Theological Library thereof;—2*d*, Letter of Dr. Alexander Jameson, in regard to the limited access allowed to the public Library and Anatomical Museum of said College;—3*d*, Letter (Anonymous) in regard to the Fee exacted for attendance at the Third Greek Class of said College;—and, 4*th*, a Letter from Mr. Epps, Student, complaining of the Janitor's Fees—and having examined several persons in regard to these matters, Notes of their Evidence were reported to a Meeting of the Commissioners, held on 12th May 1827, and received by them, and ordered to be printed.]

(*No short-hand writer present.*)

Mr. *William Cuningham*, Student of Divinity, Secretary to the Students' Committee, called in and examined.

Mr. Cuningham.

10 May 1827.

Petition of Divinity Students.

Has seen, and acquiesces in all the statements of the Petition.

On what ground do you say that this Library was founded by a voluntary collection on the

University of Edinburgh.

Mr. Cuningham.

10 May 1827. Petition of Divinity Students.

part of the Students of Divinity among themselves?—On the authority of the Donation Book, which used to lie in a tin case in the Divinity Library. The Professor of Divinity, in 1815, sent the door-keeper to carry off this book. Mr. Paul (now Minister of Maybole) took it from the door-keeper, and retained it in his possession for two years. In 1817, it was given to the Senatus Academicus. The Students gave it up to Mr. Christison, who engaged to return all the papers—but retained it, as he said, "by order of Dr. William Ritchie, and the Senatus Academicus." The Students took a notarial copy of the title of the Donation Book, and of the first entry therein, which is as follows:—

"The Students of Theology in the College of Edinburgh, in the year 1698, collected amongst themselves, at the desire of Mr. George Campbell, their Professor, the sum of £376. 15*s*. Scots, intending thereby to found a Library for themselves and their successors, which money was sent to Holland and London for such books as were thought needful.

"*April* 16, 1718.—Given into the Library 24 Old Testaments in Irish in quarto, and 24 New Testaments in octavo, ordered by the General Assembly to keep therein, and not to be given out but by the Assembly's order."

Witness does not know the date of Donation Book.

Where does the witness suppose the book to be?—I suppose Dr. Ritchie has the book in his possession.

Is there any evidence of the Students having met for the management of the Library subsequent to 1698?—I do not know.

What reason have you for saying that the right of the Students to share in the administration of the Library has been recognised by the Professors?—I have reason to believe, that, in the time of Professor William Hamilton and Dr. Robert Hamilton, the Students had a share in the management as Curators. The reasons for supposing so are the authority of Dr. Robert Hamilton (Professor from 1752 to 1780.)

Where is this authority recorded?—It is to be found substantially in the Report of the Senatus in 1817.

Was the right of the Students recognised by any other Professor?—We believe so, only in consequence of the statement of Dr. R. Hamilton. I do not know if the Students ever met for appointing Curators after the time of Dr. R. Hamilton, or why the Curatorial system was discontinued after his death. I do not understand that the discontinuance was complained of in Dr. Hunter's time till the last years of his life.

How were these complaints preferred?—A Committee was appointed, who made application to Dr. Hunter. Professor Buchanan, now at Glasgow, and Professor Alexander, now at St. Andrew's, were the principal persons concerned in this application.

Were any Minutes of their proceedings preserved?—I have reason to think so, and I think the Minutes may be obtained.

How do you make it appear that the accounts of the Library were submitted to the Students, with the vouchers, during the incumbency of Dr. Hunter?—It appears from this, that a great number of them are found among the lumber of the Library.

Do they appear to have been audited or approved by the Students?—I cannot say, as there are no Minutes.

Do you understand that the Students were called together, or had any meetings for auditing the accounts?—I cannot say that the Students met to audit the accounts.

You state that one of the first acts of Dr. William Ritchie was the re-establishment of the Curatorial system; how does this appear, or how did he intimate it?—I do not know. I have a letter from Mr. Buchanan of Glasgow, who says that he drew up a set of Regulations, but does not know how long they continued in force. He says that the Regulations were submitted to the Professor, and afterwards to the Students, and approved by all parties interested. The Curators were selected by Dr. Ritchie from a list submitted by the Students. The Minutes of the proceedings cannot be found, but they are supposed to be in the possession of a Mr. Aitkin, a schoolmaster at Dunfermline, and it is hoped they may be obtained. The Minutes of the Curators acting under the New Regulations are extant, and in the possession of witness. The Curatorial system was broken up in consequence of Dr. Ritchie refusing any longer to concur in the proceedings.

On what ground do you say, in the Petition, that Dr. Ritchie repeatedly and most solemnly acknowledged the right of the Students to manage the Theological Library conjunctly with the Professor?—I have two letters.—[*Here the Witness exhibited a Letter from Dr. Ritchie, dated* 28*th March* 1815, *and it was read, and Witness produces a copy.*]

See p. 486.

Is it on the ground of this letter, that the Petition asserts that Dr. Ritchie repeatedly and solemnly acknowledged the right of the Students?—There is another letter also, dated 27th December 1815.—[*Read—and Witness produces a copy thereof.*]

See p. 487.

You mention a public meeting in the Library on the 15th of March 1817, for receiving the Report of a Committee appointed for drawing up a Constitution for the Theological Library; did Dr. Ritchie call the meeting?—I do not know if Dr. Ritchie called the meeting, but he took the Chair.

How was the meeting of 15th March 1817 broken up so abruptly?—Dr. Ritchie would not allow the Students to speak, and closed the meeting by pronouncing the blessing.

You state that the claims and documents of the Students were submitted to the Senatus Academicus; was the submission of the claims and documents to the Senatus Academicus made with a view of abiding by the decision of the Senatus?—I cannot say; there seems to have been no intention of considering the decision final, and there was no formal submission; but the Papers were given in to the Senatus.

When, in relation to the foundation of the Library, you say that a voluntary collection by the Students was the origin of it, do you mean that the donations of individuals (one, for in-

stance, to the extent of 700 volumes, and another of 400 volumes) were unworthy of notice? —We mean that there was no Library before the collection; but we believe that contributions from other quarters were made simultaneously. *University of Edinburgh.*

Are there any other persons entitled to enjoy the benefit?—I understand that Preachers are admitted *Cives.* Mr. Cuningham. 10 May 1827. Petition of Divinity Students.

Might not any gentleman become a *Civis?*—I suppose only Preachers.

Are you aware, that, in the Rules appended to the Catalogue of 1757, it is stated, that every Student must pay 2*s.* 6*d.* at his entry each Session, and *any other person may have the right of Civesship at the same rate:*—If the privilege might be thus extended to persons not Students of Divinity, might not these persons, paying for the support of the Library, claim a share in its management, on the same ground with the Students?—I cannot answer the question.

You mention, in your Petition, a great accumulation of evils; what are some of them?—One of them is that the system of laws is not observed, and no evils are rectified.

Have any complaints been made to the Senatus?—No complaints have been made to the Senatus, because the students have not acknowledged the authority of the Regulations of 1817. Another evil is, that books of little use are sometimes bought.

Mention any books of little use?—Bell's Commentaries on the Law of Scotland; Hume's ditto on Criminal Law; Hutcheson's Justice of Peace; Dodsley's Annual Register; Lightfoot's Flora Scotica; Trials of Margaret Lindsay. The students never saw the accounts. They were not put into the hands of the Librarian. The students never publicly demanded the production of the accounts till last year. They were produced in March 1826. Another evil complained of is, that many books purchased have never been sent to the Library. Several have been sent of late, but there are still about 200 volumes wanting. Those which were sent in, were not marked as belonging to the Library.

How is the loss of books to be ascribed to the want of Curators?—The Senatus Academicus take no charge. No order is given by the Senatus, or the Theological Faculty, to return the books. I know that several clergymen's libraries in the country contain books belonging to the Library.

Mr. *Donald M'Kellar,* Preacher of the Gospel, called in and examined.

Have you any information on the original management of the Theological Library?—Mr. Cunningham is in possession of all the evidence to which the Committee have had access. The mode of management in Glasgow is much more satisfactory. Mr. M'Kellar.

Is the collection of books in the Glasgow Divinity Library more valuable?—I cannot answer this question, as I do not know what books are in this Library, the catalogue is so imperfect. A considerable number of *Cives* are admitted to the Glasgow Divinity Library. At Glasgow, the Curators are generally chosen from the junior Divinity students.

How can the general body of Divinity students know the qualifications of those who are only joining the class?—The character of the distinguished students in Glasgow is well known to all who attend the University. The students in Edinburgh are not so well known to one another. Witness never applied for a book in Glasgow without having it in a fortnight. Never got the book here that he applied for. Books here are often sent to the country, even in the time of session, but not so in Glasgow, without distinct permission from the Curators. The Curators in Glasgow have full power to fine. The Librarian has no power here, and the Theological Faculty never take any charge of the interests of the Library. Complaints of this Library generally proceed from Glasgow students.

Dr. *Alexander Jameson,* Edinburgh, called in and examined.

Witness is not connected with the College of Physicians or Surgeons. Attended this University nearly ten years, but was in bad health. Contributed to the Library at least seven years. Witness wished to have a copy of the New Testament in Spanish, and applied to Mr. Bain, the under-librarian, who said that he was not authorized to give him the book, without an order from a Professor. Could have easily obtained it so, but does not like to receive as a favour what he might claim as a right, though he does not assert that he has a right. The Natural History Museum appears to be liable to great complaint, as it is not on a liberal footing. There is no encouragement to send specimens of subjects of Natural History, and most students go away hostile to the establishment. Witness has also been refused admittance to Anatomical Museum. Would get admittance, he had no doubt, if he applied to Dr. Monro. Declines to apply, for the same reason stated as to Library. Witness wishes to make no complaint; merely wished to bring the matter before the Commission, as a matter worthy of consideration. Dr. A. Jameson. 2d. Public Library and Anatomical Museum.

Professor *Dunbar* called in and examined, as to fee exacted for attending his third Greek class.

No fee is exacted from the students who have attended first and second class; but he does not consider himself precluded from receiving a fee for this class. Occasionally has given tickets for less than £3. 3*s.* This third class was attended in Mr. Dalzell's time. Understands that Mr. Dalzell exacted £1. 1*s.* more for it than for the first and second. A few enter merely as hearers. These the most unprofitable sort of students. The certificate given them, at the end of the session, bears merely that they were hearers. Business of third class may be judged of, by what was done last session. Read Œdipus Tyrannus of Sophocles—Part of the Oration of Demosthenes for the Crown—An exercise once a-week, besides subjects prescribed for Essays—Three or four Essays, in addition to the Prize Essays. The fees were Professor Dunbar. 3d. Fee of Third Greek Class.

University of Edinburgh.

Professor Dunbar.

10 May 1827.

regulated by the Town-council, the Patrons. Never more than four students called up in an hour—two at a time.

Do you know what is the practice of charging fees for the Greek classes at Glasgow?—Witness does not know,—thinks that his class is cheaper than that at Glasgow, from the very showing of the communication transmitted to him by this Commission. The expense of books to students attending witness's class for first year is—Coll. 6*s.*—Gram. 5*s.*—Exercises 7*s.*—or about £1 in all. Witness states, that it might be a great good, if the same grammar were used in all public schools and Universities. This might probably be effected without much difficulty in the Universities; but the matter could not be so easily regulated as to schools. Witness will furnish the Commission with a note of the books used in the third Greek class. It is optional to students either to buy Mr. Dunbar's Collectanea, or to use the books containing the passages.

Do you know any thing of the complaints in regard to the Theological Library of this University?—There were some complaints in my time. Witness does not think the accounts were ever submitted to the students. The complaints related to the difficulty of getting books, but not to the administration of the funds. The selection of books purchased was not thought very good.

John Wilson, Principal Janitor of the College of Edinburgh, called in and examined.

John Wilson.

4th. Janitors' Fees.

Witness is principal Janitor of the College. Witness states, no fee is paid him along with the Professor's fee. Witness is paid by the Town-council, and out of the Matriculation fund. Witness is also particular Janitor to Dr. Home's class, but to no other class. He does not receive the student's tickets, excepting of Dr. Home's class. When tickets are returned to students by the door-keepers or particular Janitors of the class-rooms, to whom they have been delivered, the fee given is optional. A gentleman may give nothing if he please. None of the door-keepers receive any fee at the commencement of the session. It is not the general Janitor, but the College porter who attends the gallery of Lady Yester's church; and he ought to know the persons of the students.

Thomas Barrowman, Porter or Under-Janitor of the College, called in and examined.

Thos. Barrowman.

Witness is particular Janitor to Dr. Duncan, junior's class-room, for which he receives £10 annually; and he receives from the Library fund of the College £40 annually, for being College porter. Receives no fees from the students. When the tickets are returned to the students of Dr. Duncan's class, some pay him a gratuity of 2*s.* 6*d.*, or 2*s.*, or 1*s.*; but the greater part of the students, say two-thirds, give him nothing at all; and no demand is ever made.

Exclusive of the £10, do you draw any thing from Dr. Duncan?—No. Some Professors give him a little *douceur* at Christmas. He attends the gallery of Lady Yester's church on Sundays to exclude strangers.

APPENDIX, No. I.

Copy of an Address by Dr. William Ritchie, Professor of Divinity, to the Students of Divinity.

Edinburgh, 24th March, 1815.

"Gentlemen,—I have deliberately considered the proposals signed by a number of students, which were put into my hands on Wednesday last. I am not surprised at the proposals you have made, when I consider the authority on which, by mistake, you have founded them. The printed paper which has for title 'Regulations for the Divinity Hall Library,' is nothing but a name. These Regulations were neither written nor dictated. They claim not my authority, nor the authority of any human being. They are Regulations without a Regulator, and without any specific subject to be regulated, for they do not even tell over what Divinity Hall they are appointed to preside. That Library may be in St. Andrew's, or in Aberdeen, or in Glasgow, or in Edinburgh. That paper was never announced by me from the Chair, for receiving the approbation of students, in concurrence with that of the Professor; and without being so announced and so approved, how can a deed of legislation for our Hall be said to have the sanction of official authority? I have been so far from acting, or thinking myself bound to act upon these Regulations, that I had entirely forgotten their existence. Proposals supported by so baseless an authority, the students, I hope, will have the manly fortitude to withdraw. In doing so, they have an illustrious example to follow. I have the authority of the Very Reverend Principal Baird to state, that he, when a student, did, together with the late Dr. Finlayson, and some other students, engage in the cause which you now maintain, and did present a Memorial on the subject to the Professor, in the year 1785. The students of that day, upon making inquiry into the history of the Library, which they did most minutely, found that their claim was not good, and they, as became them, renounced it. The students of this day will not yield in frankness and candour to those of 30 years ago. Following the example of such respectable names as those of Dr. Finlayson and Dr. Baird, in their conduct upon that occasion, they will, I trust, follow them successfully in the path to eminence and fame.

"I am not at present to enter upon the subject of Curators. In a few words, I mention that I have attempted with little success to trace the history of the Library, and I find almost nothing established, either by law or practice, except the fact that, during the 40 years preceding my admission, there was no nomination by the Professor, and no election by the students or curators.

"I now announce that our new catalogue is to be printed in the course of the ensuing summer, and that in the course of next session I will submit to the students some Regulations for the management of the Library, by which, when mutually adopted, we shall be mutually bound to abide. These Regulations I presume not to think of imposing upon you, but of submitting to you for your approbation or disapprobation. I am zealous to maintain for students every right and privilege which they can justly claim, and I am persuaded that students will all unite in strengthening my hands, to maintain the rights officially transmitted to me, and which I am bound to transmit unimpaired to my

successors. Acting thus together for one good end, we shall prosecute our studies without interruption, maintaining the unity of the Spirit in the bond of peace. (Signed) WILLIAM RITCHIE.

To the Students of Divinity authorized to meet in the Divinity-Hall on Saturday, 28th March 1815.

Copied and certified by
(Signed) WILLIAM CUNINGHAM."

University of Edinburgh.

10 May 1827.

No. II.

Copy of a Letter from Dr. Ritchie, Professor of Divinity, to Mr. Matthew Leishman, Student of Divinity, and authorized to be communicated to the Students in general.

"DEAR SIR,—A letter dated 25th November last, which you some time ago put into my hands, refers to a letter from me in the month of March last. The object which I had then in view, and which I very shortly mentioned, has not been neglected nor forgotten, but suspended in consequence of an event which took place last summer. The Act of Parliament granting an annual sum for finishing the College-buildings, gives us now the certain and immediate prospect of a new Hall and a new Library-room. When that room shall be prepared for the reception of the books, then will be the time for making our new arrangements—then Curators must and shall be chosen. With their assistance, a constitution for the management of the Library, which is so much needed, shall be made out and recorded—the establishment of Curators, as far as depends upon me, shall be rendered permanent, and thus every object, which I believe the students have in view, shall be obtained. The only difference of opinion between them and the Professor seems to be the *time* when these things should be done. From the moment I heard of the Parliamentary grant, my opinion has decidedly been, that the proper time, which cannot be distant, will be when the removal must be made of the books to the new apartment. Some students may think otherwise, but I trust these students will, upon reflection, find it not unbecoming on their part, to adopt the opinion of their Professor, as to a matter of mere expediency, since on what is important, his views so entirely coincide with theirs. For the information of the Hall, I shall announce the substance of this Letter from the Chair, on some convenient day before the end of the session.

I am, with due regard,
Dear Sir,
Your very obedient Servant,
(Signed) WILLIAM RITCHIE.

Argyle Square, 27th December 1815.

Copied and certifiedby
(Signed) WILLIAM CUNINGHAM."

Edinburgh, Saturday, 12th May 1827.

The SOLICITOR-GENERAL in the Chair.

[*No short-hand writer present.*]

Dr. *Duncan*, Jun., Librarian, called in and examined.

Dr. Duncan, junior.

12 May 1827.

You are Librarian in the University of Edinburgh?—I am, in conjunction with Dr. Brunton.

Are there any rules or regulations relating to the conditions on which books are lent out to students?—There are regulations in practice—but I have never seen any printed regulations—only all matriculated students are understood to have a right to use the Library.

Will you be so good as state the general principles of the management of the Library?—Originally, matriculation was optional, and only those who matriculated were entitled to the use of the Library. At present, it is open from 11 to 4 o'clock—students bring slips of paper with titles, and hand them in at a wicket to the Librarian, who proceeds to find such books as are in the Library; and, if he finds them, delivers them to the applicants, or states, if the fact be so, that the books are not in. When a student gets a book, he subscribes an obligation to return it in a fortnight uninjured, and he makes a deposit—generally £1 (for which he gets a receipt from the Librarian)—or he deposits the value of the book. Deposits generally remain with the Librarian all the session. When the student returns the last book got out by him, the deposit is returned, and the receipt delivered up. When the value of the book much exceeds £1, a higher deposit is demanded. No complaint has been made on the score of the deposit. All sorts of books are not given out. We have discountenanced the practice of giving out novels, plays, or other books considered inexpedient for students to read during their attendance at the classes. No other restriction, except when the books are of very great value—and even these are occasionally given out on application to the principal Librarian.

Are students allowed, and are they in the practice of reading works in the Library?—They are allowed to do so; but the accommodation is very bad—the large room is generally used, and sometimes they are taken up stairs for that purpose. A reading-room is to be prepared in the Lower Library of the New Buildings, in which are to be no books except those brought for the use of the readers.

Would there be any objection to the use of the large Library by the students?—I think they ought not to be admitted at all times to the large Library. It would be objectionable on many accounts. Many students are too young. This large room will be more of a show-room. The proposed reading-room will be sufficient for the object in view.

Is there any printed Catalogue of the Library?—There is no printed Catalogue, except of the Medical books. The books most wanted are to be kept below stairs, in a room to which students have no access.

How is it ascertained that the Librarian acts fairly towards the students?—There is no check except his own fidelity.

Could the Receipt-book be consulted, to prove that a book refused was previously bor-

University of Edinburgh.

Dr. Duncan, junior.

12 May 1827.

rowed?—The Receipt-books could not be consulted. Such consultation would be a great waste of time, and would occasion much confusion. The quantity of business done is more than the Under-Librarians can well overtake.

Is there any Register of the books borrowed kept?—There is no register of the books borrowed by students, except their receipts. The receipt stands in the name of the borrower, but not of the book. Every receipt has a number attached to it. The student has the same number, counterpart of his receipt, and, on returning one book, he obtains another, which is entered on the same place, and the book returned is marked out.

Would any inconvenience arise from allowing gentlemen engaged in literary works to use the Library?—An individual book would at any time be granted to an author, or any person engaged in literary pursuits; but it would not be safe to give them a right. Great inconvenience is experienced from the right of the Surgeons—it interferes much with the use of the books by the Medical students. The Surgeons often borrow books for their apprentices, and retain them long.

Are the books which have been bequeathed to the Library kept separate from the other books?—No, they are not kept separate at present; but it is intended to keep them separate afterwards.

Is any dissatisfaction expressed by the students, concerning the manner in which the Library is conducted?—Dissatisfaction has been expressed by students, and generally by those who do not make the best use of the Library.

Explain how the business of the Library is conducted?—[*Receipt-books produced, and manner of using them described.*]

Deposit Book.

In one column there is a receipt for the money deposited, which is cut off and given to the student, and in another column he gives a receipt for the book. This receipt is retained in the bound receipt-book. The same number is on both columns.

Would there be any objection to have the same receipt-book for students and Professors?—The volume would be very bulky.

Do you know the average number of books borrowed in the day?—I cannot answer the question from memory. Mr. Bain, Under-Librarian, has a statement showing this. There is a constant interchange of books every minute.

Are many books lost?—Not a great many—a few are.

Can you tell if a book be lost?—It is often difficult to say if a book be lost or not.

Is the press mark on the receipts, or merely the title?—Generally the title only of the books lent to students.

Is the date annexed to each book borrowed?—The date of the borrowing, except the first book, is not inserted, and therefore it cannot be ascertained how long the books are kept.

Is it not a great disadvantage, that a careless student may keep one of the most useful books a whole session?—It is; but it cannot easily be rectified.

Might not the Professors have the books reported to them, when they are not returned by their students?—Professors would not think it incumbent on them to act upon such report. Many students keep out books very long.

Might not students give in a receipt with the date in their own handwriting, in a printed form, containing the titles of their books, and the class they attend, and their residence?—It might be done.

Is it not a disadvantage to change books every day?—Students often require books which satisfy them in a very short time. Some of the evils may be remedied when the new Library is opened, when there will be facility for reading.

How many Librarians are employed?—There are two Under-Librarians, and two Supernumeraries. The salaries occasion considerable difficulty.

Could gratuitous assistance be obtained?—I would never countenance this. Students so employed fall into the habit of lending books to their private friends. It would not be easy to obtain young men to undergo the drudgery, and it would not seem to them to be any benefit to be present as servants. Students of Divinity were employed formerly, and they showed great partiality in giving out books, and were not nearly so attentive as hired Librarians. They were often changed, and every new one required to be taught.

Are the Under-Librarians attentive?—Every attempt is made to serve the students.

Is there any objection to give out the whole volumes of a book at a time?—The only objection to giving out all the volumes of a book at a time is, that the book may be read by a number at the same time. There is no rule against giving more volumes than one at a time, and some latitude is given to attentive students who are regular. Some students destroy the books very much.

Is it not a cause of discontent, that too much is left to the discretion of the Librarian?—No. The chief complaint arises from the time students are kept waiting, and the immediate answers given by the Librarian that a book is out, when he knows it is so. Many books are kept as near as possible to the place where the business is transacted; others are in inner rooms. Students give in slips of paper, with the titles of the books wanted. The Under-Librarian takes as many lists as are presented at one time, and immediately goes in search. On returning, he informs some that the books they wished are not in, and delivers to others the books he has found. Then another set is served in the same way, and so on. At other times, he says at once such a book is not given out, or only under particular circumstances.

Is there any rule, stating what books are to circulate, and what not?—No general rule. Very expensive books, rare books, dictionaries, encyclopædias, &c., are not circulated. Some books are circulated freely, with the exception of one copy always kept in. A book is sometimes given to one student, from particular circumstances, which would not be given to another.

University of Edinburgh.

Dr. Duncan, junior.

12 May 1827.

Have any Professors more books out at a time than they ought to have?—Some Professors have too many books out. They are not entitled to more than a certain number at a time, but it is difficult to limit them. Every Professor has a page in a separate book, kept for Professors alone. It is not easy to check abuses. Our Law Professors have told us that we had no power to fine, and it has been thought too severe a punishment to suspend the use of the Library.

Does abuse on the part of the Professors and Surgeons interfere much with the students?—The Professors do not clash much with the students. In the case of Prizes, there is often great discontent, because those who foresee what books may be recommended on the subjects, get the start of others, and in this way prevent others, who apply immediately after the Prize-question is announced, from having the use of them, and they naturally think that there is something improper in the conduct of the Under-Librarians, which is certainly not the case.

Are there any abuses in the mode of purchasing books?—Formerly Professors purchased books of their own accord at shops, and kept them years before they reached the Library. There is no such thing now. The Curators alone order books.

Has the institution of Class Libraries lessened the pressure upon the General Library?—Class Libraries have not diminished the use of the Library. The applications are increasing daily—the students have much more use of the Library than formerly. The Under-Librarians do everything in their power to serve the students. There were many complaints in Mr. Dalziel's time on account of the incivility of the Under-Librarian.

Would not an alphabetical receipt-book be better?—I have never thought of this; but it appears to me, that, from the frequency of exchanging books, the receipt-book on that principle would be enormously large, and exceedingly inconvenient, and the system perhaps impracticable.

Having an alphabetical receipt-book, would not the students be enabled to see at once whether the books wanted were out or in, and thus operate as a check on the Librarian?—Yes; but that would be the only advantage.

When a student brings back a book, does he see the receipt scored out?—He does—he is entitled to see this done.

Have you any means of ascertaining the books that are out?—None, except by ascertaining whether they be in their places in the Library, and by an examination of the receipts. The practice is to examine them occasionally, to ascertain this fact.

Does the present system answer?—The present system is the result of long experience, and it works very well.

It is understood that there are many complaints made against the management of the Library; can you state the nature of these, if any?—A complaint may be made by students that they cannot get the particular books they want; but they do not advert that the same books are generally sought for by many about the same time. The Librarian may have given out the same book immediately before, and complaints are often made because he does not look to see whether the book is in; they think he will not take the trouble. No doubt books are often out of their place, and then it occasions great inconvenience.

Could the receipt-book show to students that the books referred to were actually out?—It would not be practicable to construct receipt-books that would show the students that the books applied for are out, nor advisable. The manner in which the Berlin and Gottingen Libraries are managed is thus:—Two days are allotted for receiving applications, and two days for giving out the books. The student gives in a ticket having the name of the book wanted, his own place of residence, and a cautioner—and next day he calls for the book. In that case, the books could be entered alphabetically.

How many volumes are students entitled to get at one time?—Only one upon a deposit, and the book may be changed every day. The students are not required to give in their place of residence. The books ought to be returned in a fortnight, but this regulation cannot be enforced.

Is the present system different from what it was in Mr. Dalziel's time?—The present system is different from what it was in Mr. Dalziel's time—chiefly in each student having a page to himself; formerly there were many receipts upon one page. The numbers of the pages of the receipt-book were generally written on the first page of the books borrowed, and thus the books were spoiled.

How are the funds acquired for the support of the Library?—The funds are chiefly the contributions of students, and graduation-fees, and £5 by each Professor on his appointment, and £20 a-year from the Royal College of Surgeons.

Is any stranger—say a literary or scientific person—allowed the use of the Library, on his specially applying to the Librarian for that purpose?—Literary and scientific people must apply either through the Librarian or through a particular Professor, who must borrow the book wanted in his own name. The Librarian occasionally takes the liberty of lending a book to an applicant of the above description. Applications are sometimes made to the Curators—sometimes granted, and sometimes not. The privilege, if granted, is not as a matter of right, but of favour. If many people in Edinburgh possessed the right, it would materially interfere with the students. Any respectable person applying to sit and read in the Library, would have his request granted. If the door of the Library was opened wide, much use would be made of it, and additional attendance would be necessary. In a special case, the Librarians would be very accommodating; but some literary men are very troublesome. No privilege is acknowledged as belonging to the graduates. No number of matriculations confers a permanent right. It would be very inconvenient to extend the privilege to graduates. Classics, and mathematical works of importance, would almost all be taken out by teachers.

University of Edinburgh.

Might not graduates, making an annual payment, be allowed to read?—I see little objection to this; and, at present, leave is granted without payment.

Professor Duncan, junior.

12 May 1827.

Professors' Receipt-books described.

Every one has a part of the volume allotted to him, and the books are entered according to their dates; and again, when they are returned, the date is marked. The Surgeons' receipt-book is kept in the same way: some of them are very regular in returning them; others are not. The book is not periodically gone over for the purpose of calling in the books; but if any books are much wanted, a note is written to the Professor or Surgeon having them in his possession. The annual call has the effect of bringing in a great number of books. Lately the whole Library has been gone over by Mr. Laing, bookseller, and £3,000 is to be expended in rebinding the old books, for the purpose of putting the whole Library in order. A very large alphabetical Catalogue is now made out, extending to nearly as many volumes as there are letters in the alphabet. The total number of volumes in the Library is probably at least 70,000. The books worn out are regularly replaced, if they are much in demand; but many books go out of use. Students are often averse to take an old edition of a book, though little worse than the new.

Edinburgh, Monday, 14th May 1827.

The DEAN of FACULTY in the Chair.

Robert Jameson, Esq., Regius Professor of Natural History in the University of Edinburgh, called in, and further examined.

Professor Jameson.

14 May 1827.

You were examined before on your class in the University generally. In the course of that examination, there was a statement made about the condition of your Museum; and it bears, you were to give in a farther statement?—I gave in a short statement, and was to give in a very full one. It is now ready, and it may be delivered when the Commissioners wish it.

Be so good as to give it in, Sir.—I will.—[*The statement or account referred to, lies on the Table.*]

Is the account which you have prepared such as you referred to in your former examination?—It is.

We have some Returns from the College, and from you, relative to the Museum, but we wish a little more explanation, with regard to the state of the Museum; and, in the first place, have you any thing more to state yourself, farther than what appears in your Returns on the former examination?—I intended to state the absolute necessity for some fund being provided for the collection.

The fund, according to this Return, is £100, I think, paid annually by Government, and the sums collected from visitors?—Yes.

Can you, without an account, tell us the amount of the sums collected from visitors?—It varies. At one time it was about £700 a-year. It afterwards fell to £500. It is now about £500. The expenses are about £700.

What does the expenditure consist of?—The whole is detailed in the paper before you, and the different servants connected with the establishment, and necessary additions made to the Cabinet occasionally.

Is your Assistant paid out of that fund?—Partly.

You have mentioned in this Return, that, "At a meeting held in the Museum, attended by Representatives from the Court of Exchequer, the Court of Session, the University, and the Town-Council, I was ordered to open the Museum to the public, and to see that each visitor paid 2*s.* 6*d.* of admission-money;" upon what footing was it, that there were Representatives from the Court of Exchequer, and from the Court of Session?—The Court of Exchequer consider themselves Curators of the King's or Royal Museum. I cannot explain upon what footing the Court of Session sent Representatives to the meeting. The Lord President was there, as one of the College Commissioners.

Was it as Commissioners for Buildings they were there?—I cannot give any name to explain the character in which they appeared at the meeting.

Is there any minute of that meeting?—It is engrossed somewhere in the Minutes of the meetings of the Museum.

Will you have the goodness to furnish the Commissioners with a copy of it.—Is it your opinion, that is a good arrangement, that 2*s.* 6*d.* of admission-money be paid by each visitor?—As things stand, it is the only effectual arrangement.

That is to say, without another fund being provided?—Yes. Before half-a-crown was fixed on as the sum of admission-money, I corresponded with other Keepers of Museums on the subject, and the general opinion was, that 2*s.* 6*d.* was the lowest sum which should be demanded. I did not rest on my own feelings or experience, but made the inquiries I have mentioned; and that was the result.

Supposing the exaction to be continued, do you think it clear there should be no distinction as to scientific persons who might desire to come often to the Museum?—Yes; and I have taken the liberty of admitting such persons, without demanding any entrance-money. I shall mention, with your permission, the names of some individuals to whom this favour was granted. Mr. Selby, a distinguished Naturalist in the north of England, who was here on a visit, was admitted in that way. He stated, he was about to embark in a great work, on the Birds of Great Britain, and requested admission to make drawings from specimens in the Museum. At once, knowing his reputation, I granted the liberty he desired. Afterwards, Colonel Smith, a distinguished observer and draftsman, requested permission to make draw-

5,33

University of Edinburgh.

Professor Jameson.

14 May 1827.

ings from specimens in the Museum, which I allowed; and since then, he has made use of them in some very interesting works. About two years ago, Sir William Jardine, a former pupil of mine, made a similar application; and it was granted. Sir William Jardine, along with Mr. Selby, has now in the course of publication, a general work on Ornithology, many of the figures of which are from specimens in the Museum.—[*Professor Jameson laid copies of Mr. Selby's great work on British Birds, and of Sir William Jardine and Mr. Selby's work on general Ornithology, before the Commissioners*].—Since this application, another of my pupils, Mr. Wilson, a brother of Professor Wilson, solicited a similar permission to make drawings; and this, from the known talent and high accomplishments of that gentleman, was granted.—[*Professor Jameson laid before the Commissioners a copy of the first No. of Mr. Wilson's splendid work, entitled "Illustrations of Zoology."*]—I may also mention that, occasionally, Members of the Royal Society of Edinburgh have asked permission to make drawings, which I have granted; and such have been published in the Transactions of the Royal Society. Members of the Wernerian Natural History Society of the College, in the same way, have been permitted to make drawings from objects in the Museum, when the Keeper judged it right and proper. And further, to show that full and efficient use is making of the specimens of Natural History in the Museum, I beg to add, that I am engaged in a great work, which will contain representations of objects of Natural History in the Museum.

Have any instances occurred of persons having made such applications, whom you refused?—Yes, often.

Upon what *data* do you make the distinction?—If the individuals applying are on the spot, then, by conversation, I ascertain whether they are likely by their writings to do credit to the Academic Establishment. If I find this to be the case, I grant the permission. If I think they are not likely to do credit to the Establishment, I refuse the permission. Again, if the application is made by persons at a distance, I ascertain as well as possible whether they are likely to do credit to the Establishment, and if so, I grant permission, and if not, I refuse the application.

At the meeting referred to in your Return, that at which authority was given to take 2*s*. 6*d*. as admission-money, was any regulation established as to admission of Scientific persons?—None: I have taken that upon myself.

Have you made any observation on the subject to the Senatus Academicus or the Commissioners?—None.

Is this the only rule about Admission?—Yes.

Is there any regulation about a guinea a-year?—Yes, there are guinea and half-guinea tickets.

To whom are those granted, and on what principle?—To Ladies, and to such Gentlemen as have attended the Class of Natural History. If, however, individuals zealous in the study of Natural History present themselves, and who do not possess the pecuniary means for attending the Class of Natural History, these are furnished with *gratis* tickets by the Professor. If strangers zealous in the pursuit of Natural History present themselves and solicit admission into the Museum, it is granted, providing they declare their inability to comply with the pecuniary rules of the Establishment. The rule in regard to studies of Natural History, was made with a view of protecting the privileges of the class.

Do tickets of a guinea admit Ladies of the families of those to whom they are granted?—Yes. If two or three Ladies of the same family, each pay ten shillings—if one only, the ticket is one guinea.

As to other persons, the rule of a guinea a-year is confined to persons who have attended the class?—Yes; in the manner already stated.

Are those tickets not granted to Students attending other classes?—No.

Does it occur to you, that, if a smaller sum were paid than 2*s*. 6*d*., visitors might be induced to go more frequently to the Museum?—I should think not. Those who have annual tickets in general use them very seldom, and very few annual tickets are sold.

But might not gentlemen, who do not attend the Natural History Class, come oftener than that?—I should think not. I have experienced from my own Class, the Students of which have gratuitous admission to the Museum, and sometimes not much more than one half of them take advantage of it.

I see, from this Return, you purchased a considerable collection of objects of Natural History of Monsieur Dufresne of Paris; and, it is stated, you sent over agents to examine it?—A Captain Brown, of the Militia, at the time in London, petitioned hard to be sent over. I understood he had a turn that way, and, as he had nothing else to do, it was stated he might get to Paris; and he was therefore employed.

When you allow Scientific persons access to the Museum, what is the rule under which they are allowed specimens out of the cases?—That depends on the opinion of the Keeper.

Yourself?—Yes. It is a rule, that a petition must be sent in by the person for permission to take drawings; and, if the Keeper think him worthy, it is granted; otherwise, it is withheld.

I mean the rule practically; in what way are specimens given out to the person?—At present I have no rooms proper for the purpose, and they are taken to the class-room. Drawing at present is inconveniently circumstanced, both on the score of want of room, and the necessary attendants.

If drawing were allowed in the room of the Museum, would it not be better?—There is no accommodation there.

A small table only is necessary?—Many accommodations are required for drawing, and also the constant attendance of a person or persons to see that no harm is done to the speci-

University of Edinburgh.

Professor Jameson.

14 May 1827.

mens. In short, opening the Museum generally for drawing and exhibiting specimens, would entail on the establishment a large annual additional expense.

What time is the Museum open?—From eleven to four or five o'clock in summer, and it is never shut while parties continue in the room.

Specimens are never injured from that inspection?—No, never.

But, supposing an individual making application, who may not be, in your opinion, of much scientific attainment, but of respectable character, and not likely to injure the specimens, and who might improve himself much by drawing; would you, in that case, refuse the application, though he may not be competent to publish?—No, provided he would say his object was for his own improvement, and I could spare time to attend him, or get my assistant to do so, and if I could contrive some accommodation for the purpose. I have often given this permission to persons wishing to improve themselves. But, if they intended to publish, I would not allow them upon any account; as the reputation of the establishment might be effected by the publication of disreputable works.

But in what way is the reputation of the College involved?—I understand, that, before I can allow such a use to be made of the drawings, that the individual is really a man of science: if, therefore, I allow drawings and descriptions to appear as from the Museum, which are unscientific, the character of the Keeper, as a man of science, is in hazard.

Supposing another principle to be acted upon, and it were known that the Keeper's opinion was not pledged as to the skill of an individual, there is no other way in which the University is concerned?—I should think not.

Then, if another rule should be laid down, and you not called upon to form any opinion of qualification to improve by drawing, you would see no more objection to the permission?—No, provided I was instructed by proper authority so to extend the use of the Museum, and furnished with drawing-rooms and several additional attendants.

Individuals applying for such permission, whether engaged in publications or not, are not likely to injure the specimens?—They are very easily destroyed; the truth is, if specimens of animals were often taken out for the purposes of drawing and examination, *they would last a very short time.*

The process is done by the eye, and not by measurement?—By measurement and examination of colours, &c. Persons of skill are required to superintend.

Are there any instances of persons connected with publications, being refused permission to draw?—There was one lately. Captain Brown applied, and I refused his application, knowing that he was not fitted for writing nor for drawing, so as to reflect credit on the University. Considering my power, and what at present I hold to be my duty, I refused him permission to make drawings that were to be published. Had it been for his improvement, I would not have refused; but, considering the reputation of the Establishment concerned, I refused him the permission. And further, independent of the considerations already stated, I found it impossible, from want of accommodation in room and money, to grant the necessary accommodation for the purpose.

But how is it known to the scientific world, that your reputation is pledged in the matter?—It is understood everywhere that such is the case.

Are there any instances in which individuals, employed by literary gentlemen to make drawings, have been refused permission, or excluded from the Museum?—I do not remember a case of that kind.

Suppose a person pays his admission-money, and proceeds to make a drawing of any animal *not within the cases*, or which it is not necessary to take out for drawing; is that permitted?—I have a right to stop that, upon the same principle.

Have the attendants orders to stop such persons?—Yes, and there is a placard put up, to the effect that persons are not to draw without permission.

Upon what ground is it that those who entered by paying admission-money, making drawings on the spot without application for permission to draw,—upon what principle do you refuse them?—If a person proceeded in that way, he might come for a fortnight, and then go off, announcing in advertisements, he had had the use of the Edinburgh Museum. This Captain Brown has printed, without my permission, that he had the use of the Museum for such a work. That was irregular; he had no permission from me. But, independent of these considerations, any drawings made of specimens enclosed in cases could not be correct.

Was any one going on with a similar work at the same time as Captain Brown's?—Yes, that of Sir William Jardine and Mr. Selby, already mentioned.

Do you think it expedient the Keeper should be possessed of such power of withholding the use of the Museum from scientific persons, of giving or refusing them permission to make drawings, according to his option?—I think it a beneficial check. I have prevented the publication of works which would have done no credit to science. I have checked many previously, but I need not mention names. I did it on the same principle, that the publications would have been disreputable to the University, from the authors' want of skill in drawing, and ignorance of language. It would have been contrary to my practice to allow them to emanate from the University.

Have you seen any drawings of Captain Brown's?—Yes; I know well his style of drawing.

Do you see any objections to Students of Chemistry, or others who might not be here for many years, having the use of the Museum in the same way as the Students of your own class?—I should think that they ought not, on the same principle as Dr. Graham refuses the use of the Royal Garden to all who do not attend his class in Botany.

Suppose they had studied Natural History in another University, and completed so far their

University of Edinburgh.

Professor Jameson.

14 May 1827.

Course, would not it be reasonable to give them access to the Museum?—On the same principle as Dr. Graham acted, it would not; although, if the case were properly represented and authenticated, it is not likely that it would be refused.

But is the principle a good one?—I should think it right. We must live by our teaching.

But it is a Collection formed, in a great degree, at the expense of the public, and for general purposes?—The great bulk of the Collection at present is the actual property of individuals. In another view, the Museum is to be considered as an Academy for the use of the University, and which the public have no right to.

What portion of the Collection is private property?—Two-thirds of it.

Do you mean only deposited there, not given over?—Not given over.

Do you understand this Museum is in any way peculiarly appropriated to the Natural History Class?—I should think so.

Could that private property be withdrawn at any time?—It might, to-morrow.

When was the Museum opened to the public?—In Dr. Walker's time the Museum was shut, and it has only of late years been open to the public. It will be shut again, if pecuniary aid is not granted.

You are appointed Keeper by the Crown?—Yes.

But it does not follow that the Keeper of it should be appointed also Professor of Natural History?—They always go together.

Yes; but that is matter of discretion on the part of the Crown?—I do not know how far that may be the case; my Commission will show how it is.—[*A copy of the Commission lies on the table.*]

Captain *Thomas Brown*, F.R.S., Edinburgh, &c., called in, and examined.

Captain T. Brown.

You reside in Edinburgh at present, I understand, Captain Brown?—Yes; at No. 5, Lothian Road.

Are you a Fellow of the Royal Society of Edinburgh?—I am.

You sent us a Memorial as to getting admission to the Museum: we wish some farther explanations as to that. You state, in this Memorial, that refusal to be allowed the use of the Museum for drawings had prevented your fulfilling an engagement to publish a work at the time you had intended?—Yes; it is still unpublished.

Is liberty to make those drawings necessary to enable you to go on with the work you wish to publish?—Yes, unless I go to London and Paris; and even then it would be ultimately indispensable to have admission to this Museum to complete my work, as there are birds here not in other collections.

In the prospectus you were so good as send to the Commission, along with this memorial, you do not state you had obtained permission to use the Museum?—I forgot to state in my memorial that I considered I had permission, from what passed with Professor Jameson. He said distinctly, I would have permission, the first time we spoke on that subject.

In the prospectus you published?—It is not yet published, nor indeed printed off, although I desired the printer to do so yesterday. I intended to publish it at the end of this week. I did not withdraw the words "*College Museum*" from it, as I had no doubt I would be ultimately admitted for the purpose of drawing, &c.

On what footing is the admission to the British Museum given, to which you refer in this prospectus; did you obtain permission there?—Yes; application is generally made by letter to the Secretary. When last in London, I was put into a separate room by myself, and was allowed the use of what I wanted.

To whom did you make application?—To Dr. Leach, Zoologist to the Museum, and I got permission at once.

Were any testimonials required of your scientific qualifications?—None at all; I simply stated to him what I intended publishing; and, although engaged in a work, the same as mine in every respect, he did all in his power to forward my views.

Was any inquiry made in reference to the work you intended to publish?—None, as to my reasons for drawing birds.

Were any restrictions mentioned as to the nature of drawings?—None at all; I had only to fix on whatever subject I pleased, when one of the porters removed them into the room I used, and took them away when I was done with them.

Nor as to specimens you were allowed the use of?—No.

Or as to the use you were to make of drawings?—No; only it is probable I mentioned, in a friendly way, to Dr. Leach what my views were.

Was it stated you were to publish the drawings?—I stated such was my object.

Did you understand there are any regulations printed, to which we could have access?—I do not know. It was in 1820 I applied to Dr. Leach; and, in the course of 24 hours, he gave me the use of a room, and gave me all that I asked. When I proposed the present work on Ornithology, I wrote to Lord Melville, who replied that the regular channel to make application was through the Secretary. I accordingly wrote him; and permission was granted me, by the Trustees, to make such drawings as I pleased. I made a similar application to the Honourable Hugh Lindsay, Chairman of the Honourable East India Company. I received an answer, by return of post, granting the free use of their valuable Museum.

And for whatever length of time you desired?—Whatever suited me.

You refer in this prospectus to the Linnæan Society; is it private?—Private. The collections are, as in other societies, the property of the members.

On what principle is the collection exhibited?—To the members, who have free access at all times, and may recommend strangers to have the use of the collection, which is never refused.

University of Edinburgh.

Captain T. Brown.

14 May 1827.

Are you one?—Yes, I am.

You refer also to the Jardin du Roi at Paris, and the Museum at Haerlem; on what principle is leave there granted?—At the Jardin du Roi, application is made to the Secretary of Administration, and in a few hours it is granted.

Had you permission to make drawings?—I had before unlimited [command of the Museum; and any respectable individual is not only allowed free use of the collections, but also the use of the Library. All that is required is a simple application to the Administration, signifying your desire to study *all* or any department taught in the Garden of Plants; a ticket or tickets are given to you gratis, a copy of one of which I now hand you.

The following is a Copy of the Ticket.

"Administration du Muséum d'Histoire Naturelle au Jardin du Roi.—Cours de Minéralogie.—Capt^n. Brown, *Etudiant.* Haüy, *Professeur.*"

The following is a Copy of the Reverse Side.

"Les Galeries d'Histoire Naturelle et la Bibliothèque seront ouvertes aux Etudians, sur la présentation de cette Carte, les Lundis, Mercredis et Samedis, de onze heures à deux.—Tout est gratuit dans l'Etablissement."

Had you ever permission of drawing?—I was allowed to go in any day I choose; that is, I had leave to visit the Museums and Menageries—even on the days that the public of France is excluded, I was admitted. Foreigners are always particularly favoured. Baron Cuvier, who is at the head of the Administration, ordered me to be admitted even on the cleaning days, if I was inclined.

Were any restrictions put on you, not to publish those drawings?—No; not a question was put to me. The French, as well as every other liberal-minded man in our own country, conceive that too much cannot be published on science, as it tends to improve the national taste.

Were you previously known to this gentleman?—No; I went to visit the Museum at Paris, and I had a private letter from Sir Joseph Banks to him.

Have you ever been at the collection at Haerlem?—No. But I understood from Mr. Temminck, the Superintendent, access is got by letters, and that without the least trouble. All the Continental Museums are easy of access.

You state, in this Memorial, you applied to Dr. Duncan and the Principal?—Yes. I did so in accordance with the recommendation of the Lord Advocate.

You had no answer from Principal Baird?—I had none. But Dr. Duncan wrote me the instant he went home and found my letter, at four o'clock.

Have you presented an application at any time to the Senatus Academicus?—No. I applied to Professor Jameson, in the manner he recommended me. I never thought of asking admittance gratis; I only expected admission by paying £1. 1*s.* annually, which was cheaper than 2*s.* 6*d.* each visit; but Professor Jameson said I would get free access, and refused me an annual ticket on that account.

You state in this Memorial, that a proposal was made to you by Professor Jameson, to draw up a plan for the management of the Museum, and that you were ultimately offered the superintendence of it, which you refused in consequence of—(please look at this passage of the Memorial.)—[*Captain Brown having examined the passage, observed that he had failed to express his meaning clearly, from the hurry in which he had written it; and he then inserted the words*—" in consequence of duties being required of him."]

Have you written any papers on Natural Science for the Encyclopædia Britannica?—Yes, I have.

Mention some of them?—I wrote the article Conchology for the Encyclopædia Britannica, and I wrote for the Encyclopædia Edinensis, and many other things.

Have you published drawings connected with those articles?—Yes; all were published from my own drawings.

Artists were not employed by you?—No.

You state they were executed by yourself?—Yes. It is of the utmost importance for a Naturalist to be able to draw, for various reasons: namely, he will thereby be enabled to express better than an Artist the generic and specific characters of his subjects; and artists who can draw sufficiently well, charge such enormous prices, that it is one great cause of works on Science being generally so expensive, and from which they are inaccessible to persons of moderate fortune.

You mention, in your Memorial, that, in one of your conversations with Professor Jameson, he expressed a high opinion of your work?—Not a high opinion, but that he approved of it. He spoke both to myself and General Stratton. To him, he spoke generally in favourable terms—said that he had looked at the specimen in his possession; and, as far as appearances went, it was a very pretty thing, but he had not critically examined it, nor compared the Birds with the originals. To myself he also spoke favourably of it—seemed much pleased that Edinburgh was at present producing so many great Works on Natural History; viz. Audubon's Birds of America; Selby's Illustrations of British Ornithology; Mr Wilson's Illustrations of Zoology; Jardine and Selby's Illustrations of General Ornithology, and my work on the same subject; as also my illustrations of the Conchology of Great Britain and Ireland: he said, he hoped they would all go on. He said to myself, that any author undertaking a work likely to be respectable, would get free access to the Museum, which I understood was just saying, I have no doubt you, Captain Brown, would get access; and, indeed, he had no doubt but my work would be respectable.

Was any thing of what you have published taken from the Edinburgh Museum?—No;

1537

University of Edinburgh.

Captain T. Brown.

14 May 1827.

except that I made some drawings of Fossils for Professor Jameson, to illustrate his article on that subject in the Edinburgh Encyclopædia.

You never had permission to make any drawings there?—Never. A circumstance occurred which I may mention. This very work before me (Wilson's Illustrations of Zoology) was projected by Dr. Greville and myself in 1820, and was intended to embrace all departments of Natural History, and we got permission from Professor Jameson for the use of the Museum, and agreed with a bookseller to publish it; and we got Dr. Graham's permission to draw from the Botanic Garden. After we had fixed on our subjects for our first fasciculus, Professor Jameson said he had changed his mind, and would not allow us the use of the Museum. He said the College intended themselves to publish a History of the Museum. I mentioned afterwards to the Principal and Dr. Duncan, junior, what Professor Jameson had said was contemplated by the College; and, moreover, that it would be the last thing the Senatus would think of doing as a body. They said there was no such thing in contemplation.

It will be necessary we should furnish Professor Jameson with a copy of your Memorial. You may wish first to revise it?—No; I have no wish to revise it. You are quite at liberty to send it to him. I have no quarrel with Professor Jameson.

And you rather wish it to stand as it is?—I know no reason for making any alteration on it.

You mentioned you had written it hurriedly. It will perhaps be better, for you own satisfaction, to read it over; and, if you wish any alterations made, you can make them, and return the paper to the Secretary.—I will do so.

In the Linnæan Society is any qualification required to be admitted a Member?—Yes; you must write a Petition, which must be signed by two Members, of their personal knowledge, stating you are a person devoted to Science—and that is hung up in the room for three months previous to admission.

Who attested your Petition for admission to the Royal Society of Edinburgh?—I think Professor Jameson and Mr. Allan. I am not positive at this moment; but I think so. I am also a Member of the Wernerian Society, of which the Professor is President; and it was by him I was proposed as a Member.

I think you said, in your Memorial, you purchased Dufresne's Collection, and part of Bullock's for the College?—Yes.

Had you, with a view to obtain knowledge of the Collection, urged to be employed?—When the Catalogue was sent by Dufresne to Scotland, my opinion was asked by Professor Jameson, and it was favourable; and I said I would be happy to go with any other individuals to Paris, At the last conversation I had with Dr. Andrew Duncan, the day before I left Edinburgh for London (where I was going to make drawings to complete a work of my own), in Mr. Constable's shop, he said, if you say you will go to Paris, the College will direct you to purchase the Collection.

How much was paid for that Collection?—£2,600 odds. I examined the Collection from six in the morning till dark, for eight or ten days; every object came through my hands; I took notes as I went on. When I had terminated my inspection, I considered the thing minutely, and then agreed for the purchase.

Did you take all this trouble merely for the love of Science, or were you paid for it?—I was not paid for it; and I did it from the love of Science alone, and that my country should be benefited by it.

Not even your expenses?—They paid my travelling and other expenses; I made no charge for the loss of two months of my time. I went to London for the purpose of drawing; and, from the length of time I was occupied on the business of the College, I was unable to stay long enough to finish my work.

In reference to the difficulty you met with, as to your own work on Ornithology, have you sustained any pecuniary loss in consequence?—Sir William Jardine and Mr. Selby have published on the same subject; they have got the start of me by two numbers. Some of the drawings I have, were made six or seven years ago, some at Paris, some in the British Museum. I find several of the specimens then drawn were young birds. This I have only lately ascertained by comparing my drawings with those in the Museum. I have not been in the Museum for four years. I should wish to exhibit the full-grown Birds, and correct the colouring of some of them. I have the first number ready for publication, except what a few hours' use of half a dozen birds in the Museum, would enable me to correct. If I publish them in their present shape, it must injure my reputation.

Mr. *James Haig*, Assistant-Librarian of the Advocates Library, Edinburgh, called in and examined.

Mr. James Haig.

You are one of the Librarians of the Advocates' Library?—Yes.

Have you ever seen the Receipt-books, under which books are given out for the use of Students in the College of Edinburgh?—Yes. I was in the College Library three years.

Then you are perfectly acquainted with the system?—Quite so.

Was that before or after Dr. Duncan was Librarian?—While he was Librarian.

Can you suggest any improvement on the system, so as to give Students books without loss of time—to enable them to ascertain whether books are in, by reference to the Receipt-book—and to ascertain the time for which the person has a book out?—In the College Library, the Students are only allowed one book at a time, unless they deposit a pound for every volume they get out; and it occurs to me as hard to order three pounds to be deposited for three books, which are perhaps not worth a guinea.

Is the deposit never less than that you have mentioned?—Never: and, when attending

University of Edinburgh.

Mr. James Haig.

14 May 1827.

more than one class, more than one book is absolutely necessary for a student in the pursuit of his studies,

Are books much injured by Students?—Very frequently.

Are many lost?—They are very seldom lost. The deposit secures against that.

And, I suppose, students are frequently kept long waiting in the Library for books?—Yes.

And, at the end of it, perhaps told the book which they ask for is not in?—Yes. It occurs to me, that there should be more Assistants than at present, because it is impossible for two to do the whole duty of serving so many students in a day, as I have seen attend for books.

Could you suggest any better plan for keeping the Receipt-book, *e. g.* entering a book under the title of the work, as Bell's Anatomy; so that it might be at once found whether the book is in or not?—In general, all the books, given out daily, we had in one place.

Supposing a book asked for that did not happen to be in that select number, then you could not tell, from the Receipt-book, whether it was in the Library?—No; but it would be an easy plan to have an alphabetical index, entering all the books borrowed; for instance, Bell's Anatomy under B; and making the student sign his name on receipt of it.

Could that be done as easily as the present system works?—It would be much easier, I think.

We shall be much obliged to you to draw out, in writing, any suggestions you could give us for the management of the College Library, without the least reference to the present system, both as to keeping books, and as to their arrangement; and any thing else, which your knowledge of that Library, and of the Advocates' Library, enables you to suggest?—Is there any time within which this is required to be done?

As soon as you can conveniently for yourself.

I suppose there are necessarily a great many complaints by students on account of being kept so long waiting?—Yes. We made it our business to accommodate as far as possible; but many complaints were made by students of having to wait so long.

Are any of them allowed to read in the Library?—It was not the custom at the time I was in it; but I understand they have adopted that since.

From your knowledge of them, would you feel any difficulty in trusting the ordinary run of students with books?—Not in general.

They are injured only by the very junior students?—Frequently leaves are torn out of books; and they are rendered imperfect, and often abused.

Are the books examined when returned by the students?—That is impossible—there is not time for it; merely the titles are looked at.

So that a book may be a good deal destroyed without this being observed?—Yes.

Who kept the deposit-money?—It was given to Dr. Duncan. I was under Mr. Bain, and I returned him an account every day; and he did the same to Dr. Duncan.

What was done with the money?—It was put in a bank.

Was any sum left with you to return to the boys, when they returned books to the Library?—About £10, generally. We knew about what would do, and provided accordingly.

Do you understand the deposit is felt as bearing hard on the circumstances of any, or many Students?—Particularly hard on a great many. Although not leaving the College, they are often obliged to take out the deposit on Saturdays, to meet the expenses incurred during the week-days. It is hard, when it is necessary for them to have more than one book, to deposit the amount required. While three volumes may be worth little more than a guinea, they have to deposit three pounds for them. And they are not allowed to borrow books with plates. Only common books are given out.

Are not even ordinary travels given out?—Yes, if they have not valuable plates; Anacharsis' Travels, for instance. If there are plates, or atlases, the volumes are not allowed, without a higher deposit; as high, in some cases, as three pounds.

Could the deposit be safely dispensed with, or diminished?—If the Matriculation fee were raised a little, it might go for something.

But, with a view to the security of the Library, to prevent books being carried away or lost, or injured, could the deposit be done away, or diminished?—If all books were ordered to be returned to the Library a month before the classes are given up, the danger would be less.

In the paper you are to prepare, keep in view any plan for recovering books from students, either by writing the classes they are attending, or their lodgings, or whatever way appears to you most practicable. Is it possible, do you think, to get any of the students, if more valuable privileges were given to them, to assist the Librarian gratuitously?—I think that would not answer. It would create confusion, unless they were well acquainted with the arrangement and places of the books.

Would it not be of some advantage to have a Supernumerary or two, to examine the state of the books when given in?—Yes, that might be done by any stranger.

Was there ever, at any time, any call on students for books out on receipts?—No.

That was not attempted?—No.

We understand the lodgings of the students, or means of finding them out, are not entered at all, not even the classes they attend?—No entries were made of those particulars.

There is no date of the times of books being taken out?—Yes; the date is entered when the receipt is given for the book.

Suppose the deposit not taken up for some time, could you ascertain how long the book had been out?—No. There is merely the date when the account was opened.

Would any evil result from modifying the deposit, as by making it nearly the value of the

539

University of Edinburgh.

Mr. James Haig.

14 May 1827.

books borrowed?—I think that might be done, if the lodgings of the students were known, and the classes they attend.

Did you find much inconvenience experienced from the manner in which Professors used the Library?—They, and the College of Surgeons, certainly took up much of our time, from getting books to look at,—members of the College of Surgeons particularly. They got Novels, &c. for their families; and we had always to serve them and Professors before Students.

Were any calls attempted to be enforced on Professors for books?—Yes.

Were they returned?—In some instances. But they were not so strict then, as, I understand, is since the case. If a Professor had a book beyond 12 months, he was not deprived of the use of the Library, as far as I recollect.

Do you not think it would be an advantage if the Professors and College of Surgeons had a separate hour for taking out books?—I think it would be of great use for the service of the students.

In what manner are the books bound generally—half or whole bound?—In my time chiefly half-bound.

Is not the binding of many of the books much too mean?—It always occurred to me, that it was spoiling a good book to bind it as was then done. To bind them better would be more economical in the end, as well as give the book a handsomer appearance. A book half-bound is never paid much attention to, or proper care taken in doing it up.

Are the books in the Advocates' Library always full-bound?—Always.

Prepare that Statement for us, and we shall be much obliged to you.—I shall attend to it.

Suggestions relative to College Library. [*Supplementary to Mr. Haig's Evidence.*]

The chief object of the institution of the College Library, I believe, must have been the benefit of the Students; and the privilege granted by Queen Anne, of a copy of every book entered at Stationers' Hall, partly for the like purpose. A still greater boon was obtained in the reign of George III., when it was provided that every book published in Great Britain, whether entered or not, should be sent to the privileged Libraries.

The utility of Public Libraries, it is obvious, depends much upon the manner in which they are managed and conducted. It cannot be supposed that a Student is able to purchase every book his studies require; and indeed many of them are unable, for a time, to purchase any. It frequently happens, that the greatest economy must be observed by many of them, during their attendance at the University, through the slender means provided for their maintenance. We often see parents, in a humble sphere of life, with a laudable zeal, almost depriving themselves of even the comforts of life, for the purpose of bringing up their children to some learned profession, which occasions no small privation on their part. It is therefore of the highest importance that an establishment, such as the College Library, should be conducted on the most liberal and encouraging principles, and the utmost possible facility afforded to the Students in obtaining such books as they require.

The University Libraries may be supposed to differ from other Public Libraries in a considerable degree, as a much greater demand is made for books every day, than there possibly can be in other Libraries during the same period.

Having been requested to draw up any thing that occurred to me regarding the management of the College Library, I beg leave humbly to submit the following Suggestions, but without any intention of reflecting upon the present system:—

I. I think it essentially necessary that more Assistants should be appointed for the service of the Students, as it would save them much time in waiting for books. During the time of Matriculation, it requires mostly the whole attention of one of the Librarians to perform this duty.

II. It appears to me that a receipt-book should be kept in the following manner:—The author's names entered alphabetically; opposite to which the signature of the Student, also the date when the book was borrowed, and when returned. This is the most simple method, and it would at the same time show what books were borrowed, and the period they had been out. An Index, if found necessary, might be made for the names of the Students, referring to the particular page of each. Were this plan adopted, when a Student applied for a book, it would be entered in alphabetical order; he would sign his name, and when the book was returned, the Librarian would immediately refer to the Receipt-book, and mark it out.

III. With regard to the Deposit-money, which is felt by many to be very inconvenient, probably either of the two following plans might be adopted:—1st. The Professors' Tickets are of the greatest importance to the Students; and it occurs to me, that depositing them in the Librarian's hands would be security equivalent to money itself; since no Certificate of Attendance can be given without the actual possession of the tickets. The classes the Students are attending, to be entered in the Receipt-book; his lodgings might also be noticed at the same time.—2d. A Student might be allowed to have the use of books from the Library, were he to get security for one or two pounds. I think this might be done, without the least chance of entering into any litigation whatever. This might not be practicable in every instance, but there would be but few who could not bring forward this security.

IV. It might be of advantage to the Students if the new works received from Stationers' Hall, on Science and Medicine, were laid on the table; as it would afford them the latest information on these branches of literature, so essential to their improvement. This experiment might be made, with the intimation that, if any book should be carried away, they would lose this privilege.

V. With respect to the binding of the books belonging to the College-Library, it might be thought rather presumptuous for me to offer any suggestions on this point, as the management of it is left to the principal Librarian.

VI. It appears to me rather illiberal not to allow gentlemen, who have studied at the University, and spent so much money there, the use of the Library. The lending of a common book would not be attended with any loss, as none, I should suppose, would be so ungenerous as to abuse the privilege, were it granted. The rules regarding this subject ought certainly to be modified; even the deposit might be dispensed with. Taking the person's address should, I think, answer the purpose equally well with respect to the risk, or by his finding security for a reasonable amount.

University of Edinburgh.

Mr. James Haig.

14 May 1827.

VII. The hours of attendance for the public business of the Library ought to be lengthened. It frequently happens, that when a Student applies for a book, he has to wait a considerable time, and is often called away to his class, without obtaining his object. Should he apply again, after leaving his class, he may be disappointed till next day. Probably two hours' attendance in the evening would be of great advantage to the Students, as it would not interfere with the time of the classes.

VIII. It would facilitate the dispatch of giving out books, if those in daily circulation were placed as near at hand as possible, making a division of the books on different branches of Literature, and arranging them in alphabetical order. We find this method of arrangement of great service in the Advocates' Library with the Law Books; as, even in the greatest bustle of the Court, we can lay our hands on any work, either on Scots or English Law, at once, without any reference to the Catalogue whatever.

Lastly. The liberality shewn by institutions of this kind is seldom abused, but more frequently rewarded by occasional donations from different individuals. Indeed, by the provision of the Act of Parliament, it ceases to become, in some measure, the private property of a particular body, but is intended for the use of the public at large, at least for those engaged in any literary pursuit.

Advocates' Library, 23*d May*, 1827. JAMES HAIG.

Mr. *Nicolson Bain*, Under-Librarian of the College-Library of Edinburgh, called in and examined.

Mr. N. Bain.

You are the Under-Librarian of the College Library?—Yes.

How long have you been in that situation?—I think it was in the session of 1810-11 I went there.

Was that before or after Dr. Duncan took charge of the Library?—It was after.

And has the same system always continued to be followed in the management, since you went to the Library?—The very same.

What may be the average number, during session, of Students applying for books during a day?—I have never kept an account, but the number is very great during the winter session; the months of November, December, January, February, and March, are the throngest. I have in my pocket a statement of the number of deposits, from the end of October 1825 to the end of October 1826.

The following is a copy thereof:—

1825, In October,		£567—number of deposits standing end of this month.			
In November,	990	£635	taken, and	£212	returned.
In December,	1,153	373	——	210	—
1836, In January,	1,210	320	——	263	—
In February,	1,268	264	——	206	—
In March,	1,105	202	——	365	—
In April,	766	165	——	504	—
In May,	731	152	——	187	—
In June,	722	173	——	182	—
In July,	614	106	——	214	—
In August,	516	98	——	196	—
In September,	523	91	——	84	—
In October,	569	197	——	151	—
		£3,343		£2,774	

Average number of readers during winter, 1,082
and summer, 612

The number of Students who consult books in the Library, and who do not deposit, is considerable.

The Members of the College of Surgeons are about ninety in number, and upwards of fifty of them use the Library; they have out, at a time, from 700 to 750 volumes.

You state at the end of the paper, that "the number of Students who consult books in the Library, and who do not deposit, is considerable;" about what may be the number?—About a hundred who do not take out on deposit.

A hundred daily?—No, altogether.

How many daily?—I do not know. There are a great many who take books on deposit, who also consult books that are not permitted to be taken out.

To what books do you allude?—Merely books of reference.

Do many of them read for hours together?—Yes, they do.

Are they allowed to make extracts?—Yes, they are; and furnished with pen and ink to do so.

Are any books injured in that way?—I do not remember any. They are generally taken care of.

Might the accommodation for reading in the Library be more extended?—If accommodation could be had, it might be of advantage to some Students.

Do you see any objection to the large room up stairs being fitted up for that purpose?— I do not think the room up stairs would be at all convenient. It would not answer for such a purpose.

Why?—That room is to be fitted up to hold books of value. It would be injured by Students.

Suppose the room fitted up on a more economical and cheaper plan, and to contain only books given out to Students reading?—The room *below* might be fitted up for a reading-room. It would be better to appropriate it for that purpose, than to spoil the *upper* one. It would hold a great many: it is a large room. I mean the Graduation Hall.

Would that be open to any Students who choose to go in, without having obtained a book?

—Any matriculated Student has right to use the Library, and would have right to go into such a room.

Before he got the book?—The book might be given to him after he went in.

Would not it encourage Students to read, if those who wish to read, were removed from the crowd of others?—I do not think many would read there. A great proportion of the Students require to read the Elementary Books of the Classes they attend, and can read them with more advantage at home. The more experienced Student will always do the same, as they can also have the books they require to read, home with them; and they are, all of them, at liberty to consult such books as are not allowed to leave the Library. A room is to be fitted up for this purpose.

What is your distinction with regard to giving out books. Is there any fixed rule?—There are no printed rules.

Any written?—No. There is, however, a short printed notice to Students, how to apply for books.—*The Witness produced a printed notice, of which the following is a copy:*—

Library.—The Library will be open for the purpose of giving out books to Students, every lawful day during the winter session, from eleven o'clock A. M., to two o'clock P. M., except on Saturdays, when it will be shut at one o'clock precisely.—Students are particularly requested to take notice, that in applying for books, it is necessary to bring with them a written list of such as they wish, and that they present to the Librarian their matriculation ticket, and the ticket of some one Professor for the present session.—Every book taken out should be returned within a fortnight, uninjured; the same book may be taken out again for another fortnight, if required, unless previously asked for by another person.

On what principle is a selection made, with regard to the books that are given out?—The books that are not permitted to circulate, are Encyclopædias, Lexicons, Transactions of foreign and home Academies and Societies, Books of Plates, and other expensive works. These may be consulted in the Library.

As to Books of Plates, do you mean any Books of Travels which have plates?—No; I mean Anatomical and Botanical Plates. It is the Medical Students who chiefly consult these. The general Students consult Encyclopædias, Lexicons, &c.

Would you give out Parry's Voyage?—Yes.

If the value of a book exceeds a guinea, is more demanded for deposit than a guinea?—Yes; two pounds may be asked, unless we are well acquainted with the character of the Student.

And that is very much trusted to your individual discretion?—In such cases, we know well the character of the Student; but it does not occur often that books, beyond the usual deposit in value, are asked out.

Then the practical effect of this must be, to limit the number and character of the works that are given out?—It is not to be supposed that we can know the character of every Student equally well, to do so; but the object of the deposit is to secure the value of the book.

Yes; but the effect must be to limit the number of books given out very considerably?—No; I do not think that taking the full value of a book from a Student, whom I do not know, would limit the number: but cases of this kind seldom occur.

You have no means to enforce the return of books?—There is a printed regulation in force, respecting the return of books from Professors and Members of the College of Surgeons, when wanted. The Students, when taking out books, promise to return them within fourteen days.

Could you easily obtain from a Student the Class he belongs to?—It would be of more consequence to have his place of residence, in the event of a book being wanted, which he may have kept too long.

But if his Class were known, it would be of advantage?—Unless we knew the Student personally, to know the Class he attends would be of no consequence. His place of residence would answer better.

Might not the date, at which books are given out to Students, be marked?—We always did so till lately. I do not think it of consequence: it was given up to save time.

But could there be any objection to some such system as this—that a Student should have a printed form, in which he is to fill up the date, name of the book, Classes he attended, and that entered in a book, under the title of the work so given out?—I do not think this would be any improvement. It would not facilitate, but would retard the business. In all this, a deal of time would be put off. We should be permitted to adopt the system which allows us to proceed with considerable dispatch. I do not think this would answer.

Suppose a book entered as Cheselden, under C; by turning to it, it would be easy to see whether the book was in the Library?—Such a Receipt-book, from the size it must be, would become unmanageable. The present system, by small Receipt-books, into which two Librarians may be entering books to Students, at the same time, in my opinion will answer better.

Suppose two or three such as I speak of?—I rather think it would not do.

Would it not enable a Student to see whether a book he wants is in the Library?—If the book is in the Library, it will be delivered to him.

Suppose he be dissatisfied?—He has no occasion to be so, as every endeavour is made by us to procure what he wants.

The question did not imply any doubt of the Librarian doing his duty; but may not it be important that the Student himself should be satisfied that the book is not in?—I never knew an instance of a student doubting our word; I do not think such a plan would be of advantage; it would lead to much conversation, altercation, and great delay. I do not think it would do.

Are many of the Students kept a long time waiting, from the number of them who wish to get books?—Those who come with written lists in their hands, are kept a very short time.

University of Edinburgh.

Mr. N. Bain.

14 May 1827.

Those who do not come prepared with lists, but ask verbally for a single book, instead of having their lists with three or four titles upon them, will occasionally be disappointed, and must necessarily wait longer than others; therefore, if they are detained, it is their own fault, in not attending to the rules of the printed notice, that directs the Student how to apply for books.

Has any explanation been given to them by the Professors on the subject?—I am not aware of complaints having been made to the Professors; I do not know of any.

Would not it be of use to have the notice circulated among the Students?—This notice is circulated; the mode of applying for books is well known.

Is there any practical difficulty to a student in getting back the deposit?—None; it is given on demand, on receiving back the book, and the receipt he got for the deposit.

Have you any improvements to suggest to us, as to the manner of conducting business in the Library?—I do not think any method could be suggested, that would answer better than the present. When we get into the new Library, if any improvements can be thought of, there is little doubt but the Principal Librarian will be ready to adopt them, having the interest of the students always at heart.

Have you any other papers you think would be of use to us?—No, except a Return of the number of such books as have not been returned by students during the different sessions from 1811-12 to the end of session 1825-26, to show that books lent out to students on deposit, though not returned, are not ultimately lost, since I hold for them deposits beyond their value, and they may be purchased whenever the Curators may think proper.

The following is a Copy of the Return referred to, of Books not returned by Students from 1811 *to* 1825, *and for which the Under-Librarian holds Deposits.*

Session	1811-12,	2	Session	1819-20,	2
—	1812-13,	2	—	1821-22,	5
—	1813-14,	3	—	1822-23,	4
—	1817-18,	1	—	1823-24,	6
—	1818-19,	2	—	1824-25,	7

Have you any similar statements to present?—I have no other.

Is your time much occupied in giving out books to Professors and members of the College of Surgeons?—The Professors do not occupy much of our time; the members of the College of Surgeons are constant in their demands, and take up much of our time.

Are they required to give written lists?—No; they apply in the same way as Professors do, and the books they take out, are marked down in a receipt-book kept for that purpose.

Do you think it would be convenient to have them at a separate hour?—I once spoke to Dr. Duncan on the subject, but he thought at the time, that they would not agree to such an arrangement.

Is the strength of the establishment of the Library sufficient for the duty?—At present, quite sufficient.

Do you think that any changes, such as those I have referred to, would require much additional assistance?—Yes.

A previous question contemplated that the receipt-book itself would be the alphabet, with an index—one volume containing a few letters?—I never thought on such a plan before, but I fear it would not work well. The pages of such a book would become so numerous in the *long letters*, that for students to be permitted to examine it, would have the effect of putting a stop to business while he was using it.

You have no means of getting back books from Students when they are wanted?—The Students in general do not keep books long out; some do, but upon the whole there are few who do so; we generally know to whom we give such books as are in demand.

Are new books of general Literature given out to Students?—Yes.

Suppose the Life of Napoleon to be out, would eight or ten Professors get it for two years, and some such period elapse before the Students got sight of it?—No, a Professor might get it first, but a Student has just as good a chance of getting any new book.

Would a Professor get all the volumes?—Yes, but they always return them when asked; and in such cases, volume after volume would be returned.

It appears that there are a great many books some Professors have long had out?—But these are books not in general demand. The Professors and Members of the College of Surgeons are requested, by a printed letter, to return once a-year (in June) all books belonging to the Library, which they may have had out beyond six months from the date of our notice. This requisition is sometimes complied with. It would, however, be of great consequence to call in every book in their possession belonging to the Library, without reserve, once a-year.

Are you at any pains to ascertain the condition of books when returned?—In consequence of the quick way in which we must transact our business, we cannot examine books minutely; but we know their condition from having the same books often in our hands. Students seem to use the books much better than they did some years back; they are now seldom written on. Those that circulate among Professors and Members of the College of Surgeons, are taken care of.

When books are injured, is any penalty exacted?—We have never exacted any penalty, except in one instance, where the Student was found to have written unbecoming language in the book he returned. The Curators summoned him before them, and, having reprimanded him, ordered him to furnish the Library with a new copy of the book. He has not, however, complied; but the Curators may order it to be purchased with the deposit in my hands. We have sometimes occasion to speak to the Junior Students.

University of Edinburgh.

Mr. N. Bain.

14 May 1827.

Do many of them take out books?—Yes.

Do many in the Junior Classes?—Yes.

Do you think the increase of some of the Class Libraries has diminished the receipts in the General Library?—No; it has not diminished our business.

Could you say, generally, that the Students, from such opportunities as you have had of observation, read more now than when you first entered the establishment?—Yes; the Students, generally, are more attentive to their reading; the Medical Students, in particular, are very attentive.

Are there many of the Moral Philosophy Class Students who take out books?—Yes; they are most attentive in this respect.

In regard to literary gentlemen residing in Edinburgh, who may be anxious to use the Library, what is the rule?—They have no right to use the Library.

But, practically, are any books given them?—If it is merely an occasional application to consult a book, there is no objection. I never refuse.

Do many get orders from Professors?—Not many.

But many would apply if such a practice was established?—I have no doubt of that.

Suppose a gentleman, engaged in a literary publication, states his desire to consult books in the Library, (to read there, and to take notes,) and is known to Professors, would his application be attended to?—I believe it would; such applications have seldom been refused by the Curators. Dr. Duncan and Dr. Brunton have granted such applications.

Suppose a minister, Dr. Lee, for instance, were to come to the Library, wanting a book?—I would, to Dr. Lee, without hesitation, give it to him, and put it down in either the accounts of Dr. Brunton or Dr. Duncan: I have permission to do so.

Suppose any person, writing a work, comes into the Library, and asks for the sight of a book, would you give it?—Undoubtedly I would.

And allow extracts to be made?—Yes.

Have you had any complaints of scientific persons, on the subject of limited access to the Library?—No complaints from literary or scientific persons.

Do you know of any applications to take out books being refused?—Yes; I refused a Spanish Testament to Dr. Jamieson. I told him where to apply for authority, but he refused: he went away hurt.

Did you mention this to Dr. Duncan?—I took no notice of it.

Has Dr. Greville made any applications for books?—He has frequently done so.

Were they attended to?—Yes, always attended to. He has had out books in Dr. Duncan's name.

And there has been no other restriction on Dr. Greville?—I know of no restriction, excepting when he was a Student; and then he had access as other Students.

Would it be of advantage if the younger Students were to give in lists of books, as recommended by their Professors?—I think it would be of advantage.

Perhaps you may have observed whether they make a good selection of books for their reading?—Yes; they do in general make a good selection.

Who gives directions as to binding the books?—Dr. Brunton.

Is it still the practice to order most of the books to be half-bound?—Yes; many of the books are half-bound.

Is that from economy?—Yes. If we had funds, our books would be bound as they are in other rich Libraries.

Edinburgh, Tuesday, 15th May, 1827.

The Honourable Lord COREHOUSE in the Chair.

The Very Rev. Dr. *George Baird,* Principal of the University of Edinburgh, called in and examined.

Principal Baird. 15 May 1827.

Have you anything to add to what is stated in your Representation to the Commission, on the subject of your claim to an official house?—I have a Statement which I made out, and laid, in the first place, before the College Commissioners. I have an Extract from the Minute-book of the College Commissioners, of their deliverance upon that Statement, of which deliverance a copy follows:—

"Having duly considered the foregoing claims, the Committee have to regret that, in their opinion, the powers of the Commissioners do not extend to grant relief to the learned and respectable persons whose representations have been submitted to them; and this the Committee the more regrets, as the allowances appear to be very inadequate compensations to the Principal and Professors for their having been deprived of their houses in the College."

Have you anything further to add to the Representation?—There is one thing which I may state, that we were desired, when plans for the improvement of the College were preparing, to give in a statement of what each of us, the Principal and Professors, required in the new improvements to be made in the new buildings; and it has been thought I had relinquished my right on that occasion. Here is what I give in, to show that was not the case. [*Here the Principal exhibited to the Commissioners a printed paper, containing a Report by him to the Trustees for rebuilding the University, in regard to an official house for him, dated 18th September,* 1815, *which paper lies on the Commissioners' table.*] I have now in my hand a copy of my Commission, giving me a right to a house in the College, one of the clauses of it bearing,—"We give, grant, and dispone the salary, *together with any house belonging to, or which may be allotted to the said office, in lieu of the house formerly possessed by the Principal of the College.*" And I have made out a note of a few instances, from 1583 downwards, extracted from the Town-Council Records, as to orders for repairing

University of Edinburgh.

Principal Baird.

15 May 1827.

the house and orchard-wall, &c., showing there had been always a house occupied by the Principal. [*Here the Principal gave in* "Notes from Town-Council Records, as to the Principal's House," *of which the following is a copy:*]—

"*Right of the Principal to an official house in the College.*

"1583,

"17. Sept. Mr. Rollock was allowed £20 to pay the removal of his goods, books, and furniture to Edinburgh, and 'for fitting up his chamber.'

"1620,

"5. May. House-rent paid to Principal Charteris, and Principal Sands got £100 as house-rent.

"1623, Principal Adamson got £200 for house-rent.

"1648,

"10. Mar. Principal Adamson appointed to get a house in Horse Wynd, till his house, then ruinous, was repaired.

"1664,

"1. June. Appoint a kitchen to be built for the Principal's house.

"1695,

"29. Mar. Appoint Principal's garden-wall, adjoining to his house, to be repaired.

"1698,

"13. April. Appoint the Treasurer to cause build a chamber in the Principal's house.

"16. July. To build a jamb in his house.

"24. Aug. To furnish lead to it.

"1728,

"12. June. Principal's lodgings to be repaired.

"1729,

"Feb. 26. Paid Principal Wishart £10, laid out by him in repairing his house.

"1745,

"12. July. Principal's garden-wall repaired.

"1792. Principal Robertson, £95 of rent.

"1793. Principal Baird, . £40 „

Whence were these notes taken?—I took them myself from the Records of the Town-Council. They relate to repairs, showing the recognition by the Patrons of the Principal's right to a house. Principal Robertson had the house, and an orchard behind the house, on the south side of the Bridge.

Is not there a competing claim for the house in the New Buildings?—The only competing claim for it is by the Librarian; and probably it may occur to you as right, that my statement, laid before the College Commissioners, should be sent to the Librarian, and that he should give in his claim for the house. In said statement, some observations are made on that counter-claim of the Librarian.

Has the Librarian a house merely on the ground of expediency?—On the ground of expediency. It occurred to us as proper he should have one. But it appears that, from the beginning of the Library, there never was a house connected with the Librarian's situation: so much the contrary, when Professor George Stewart was made Librarian, the Patrons caused him to pay rent for a house he got in the College.

In your Representation you speak of certain Professors having right to houses; upon what is it founded; do you know?—On prescription, I believe, except in the case of the Professor of Oriental Languages. In my Commission as such, when I held that office, I find the following provision:—"Together with the house allotted to the Professor of said Class, or any sum allowed on account of such house." That is not mentioned in the Commission, I believe, of any of the other Professors; but an annual allowance was made to them in name of rent.

How many Professors are in that situation?—The Professors of Greek, of Latin, of Mathematics, and of Oriental Languages. At the commencement of the College, the *Regents*, and most of the Students, lived in the College. At after periods there were always a great many small buildings round the College class-rooms, many of which were not needed for direct College purposes; and the Professors were allowed to occupy them; and that allowance was continued by prescription. That, I believe, was the origin of the right, except as to the Professor of Oriental Languages.

You do not happen to know when that commenced?—I cannot state the dates of each respectively at present.

Was it more than forty years ago?—Yes, more than forty years ago.

Does not the Professor of Divinity claim a house?—Yes; that stands on a different footing. A certain person, of the name of Somerville, left a sum for the purchase of a house.

Was a house purchased?—I hold extracts from the Town-Council Records, stating that directions were given to the Treasurer to purchase a house. Then it is stated a house was purchased; then it was ordered to take infeftment, and pay the price; and then there is a report made that the price was paid.

Was the house, occupied by the Professor of Divinity, one of those taken down when the new buildings commenced?—Yes. There was no transaction with the Professor of Divinity at taking down the house. There was no direct transaction; but a sum is given him in name of house-rent.

Dr. *Davidson*, M.D., called in and examined.

Dr. J. H. Davidson.

Are you a graduate of this University?—Yes.

And you are a Fellow of the College of Physicians?—Yes.

Have you had occasion to attend to the Course of Education in Edinburgh required for a Degree?—I confess, not, till I was induced by a wish expressed by some Members of this

University of Edinburgh.

Dr. J. H. Davidson.

15 May 1827.

Commission; and I find there are few points on which I should venture to give an opinion. I have put down some observations in writing; and I request you will allow me to make use of my paper at present, as I could not otherwise explain my views so satisfactorily as I should wish to do.

Have the goodness to state shortly what are your views. You were educated at this University?—Yes.

Did you ever attend Medical Classes elsewhere?—At London; and I was some short time at Paris, and also at Vienna; but I cannot say I studied there.

Give us your views, if you please?—The first point I would remark on is *Preliminary Education*. The first subject that attracted my attention, in reflecting upon the Education of Medical Graduates, was that of Preliminary Instruction, for which but very slight provision is made in the Statuta Solennia of this University; an acquaintance with Latin being only required; whilst the means, till lately, employed to ascertain the proficiency of the Students, even in that language, do not appear to be the best suited for the purpose. I cannot help thinking that more extensive literary and scientific education should be required from those who mean to take out a Medical Degree, as extensive as can reasonably be expected in young men of seventeen or eighteen, at which age the study of Medicine will probably commence. I conceive that the branches of Preparatory Education should be Greek, Latin, French, and Mathematics; whilst Natural Philosophy, Logic, Moral Philosophy, and Natural History, may be acquired, either before beginning the study of Medicine, or may be attended to along with the Medical Classes. I presume that, though Natural Philosophy, Logic, and Ethics, will probably be studied, either at this or some other University, Languages, with Mathematics, may be acquired wherever such instruction can be procured; and that the proficiency of the Students in those branches of knowledge may be certified either by Diplomas, Certificates from respectable Schools or Academies, or by their undergoing an Examination by the Professors of this University. If I were asked the reasons for recommending a more extensive Preliminary Education for Medical Graduates, I should be puzzled, not from the difficulty of discovering them, but from the fear of that ridicule which attaches itself to advancing arguments in favour of an opinion which is so manifestly correct as to require no support. A preliminary Scientific and Literary education appears to be the best, if not the only proper preparation of the youthful mind for entering upon the study of so extensive and difficult a subject as Medicine, where an immediate demand is made for close attention, much discrimination, and an acquaintance with many subjects not strictly Medical. Experience has convinced me that those Students whose minds have been previously cultivated, make the most steady and rapid progress in their new pursuits, which are much less difficult to them than to those who are totally unscientific and deficiently educated. I know, besides, that it is a common subject of regret amongst most Physicians, as it is with myself, that they did not make use of youth, leisure, and opportunity, in laying a broad and deep foundation of general knowledge, on which to rest their Medical acquirements. I may be permitted to add, that were I not convinced of the necessity for a liberal education, preliminary to the study of Medicine, I should surrender my doubts to the authority of much wiser men, in England, Ireland, France, Germany, and Italy, by whose influence it has been established in the Medical Schools of those countries; nor should I be inclined to submit less willingly to the decision of the Faculty of Arts in this College, who strongly recommended a preparatory education for the Medical Graduates, in a Memorial presented, I believe, to the Senatus Academicus (which I had the advantage of perusing). A competent knowledge of Greek appears to be requisite for the Medical Students, from the fact that much of the language and terminology of Anatomy, Medicine, Botany, &c., is derived from that language, not only from the Greeks having been our earliest masters in many of the sciences, but also for the sake of convenience, from such terms being short, expressive, and explanatory, and ill supplied by the tedious circumlocutions of modern tongues. With these terms, of constant occurrence both in Lectures and in Books, the uneducated Student cannot fail to be puzzled; and he must either content himself with ignorance of their import, or bestow much time, and suffer no very agreeable fatigue, in hunting out their etymology. Independently of all these reasons, it appears to me, at least unseemly, that the members of a learned profession should be ignorant of the language in which those wrote who were their original instructors, and whose works are still, after the flight of ages, by no means unworthy of serious and attentive perusal. It seems, moreover, peculiarly unfitting that the Magnates of the Medical Profession (those who have acquired either real or imaginary dignity from Degrees, to which some privileges belong,) should not possess the standard education of gentlemen, nor be able to take that station in society which a cultivated intellect is entitled to assume.

Did not you attend a pretty full course of preliminary instruction in this University?—I attended Greek, Latin, Natural Philosophy, Moral Philosophy. I am sorry to say I omitted Logic.

Do you think that time was lost, or wish a greater portion of time had been devoted to such studies?—I think a much longer time would have been devoted with advantage to those subjects, and more so, if they were taught in an Elementary way.

You are aware that many of the Medical terms, which are derived from the Greek, have now changed their meaning; do you think that that circumstance affords any objection to the acquisition of the Greek language?—I do not think it is any particular objection, because their meaning is now well known; and when you know the original meaning of terms, and read an original author, you get the old opinion on any point, and it thus becomes an interesting study.

And thus a knowledge of the original meaning of the terms is an index to important facts in the History of Medicine, &c.?—Certainly so.

University of Edinburgh.

Dr. J. H. Davidson.

15 May 1827.

Will you proceed to give us your views farther?—The next point I have to notice, is Mathematics and Natural Philosophy. Mathematics, besides their influence in accustoming the Student to close reasoning and to patient demonstration, with their utility in "preparing his mind for excellence in other inquiries," which has made them an indispensable part of well regulated and liberal education, are frequently (at least the language of Mathematics) employed in Anatomical demonstrations, and are necessary for the proper study of Natural Philosophy, which is of much more consequence in the acquisition of Medical knowledge than many are willing to allow, who, unjustly ridiculing the misapplication of Physics to Physiology, and even to the action of particular Medicines, forget, that in the structure of the bones—in the beautiful machinery of the joints, where nature combines strength and mobility with symmetry—in muscular motion—vision, hearing, and perhaps in the circulation of the fluids in the veins and absorbents, a knowledge of Natural Philosophy is requisite, for explaining and comprehending the various phenomena. Climate and Meteorology also, which have such an influence on man and other animals, both in their healthy and diseased states, and which have been too much neglected in the study of Medicine, belong to Natural Philosophy.

Do you recollect that the late Dr. Monro, while explaining muscular action, was in the habit of referring to Borelli "De Motu Animali," a book which one cannot in the least degree understand without Mathematics?—I do not precisely recollect the fact, but I think he must have done so, as I remember reading the book while attending the class.

Can it be understood without considerable knowledge of Mathematics and the principles of Mechanical Philosophy?—Certainly not.

Please proceed farther to state your views to us.—The next point on which I beg to offer a very few remarks, relates to *Moral Philosophy*. I cannot hesitate in asserting, that the knowledge of Mind is requisite for a Physician, from the simple fact, that he is consulted, in order to ascertain the existence of insanity, and is intrusted with the management of disordered intellect. As an acquaintance with the healthy functions of the body is necessary for the study of Pathology, or disordered function, the Physician must be acquainted with Mental Physiology, or the phenomena of mind in its usual or healthy state, before he can either detail its derangements, or venture with a safe conscience to undertake the management of those unfortunate beings who have been deprived of their reason. When we consider, besides, the intimate union betwixt Mind and Body, with their mutual influence—that Mind renders disease different in every separate individual, that it affects the powers of medicine, and can be acted upon so as to hasten or retard recovery, whilst the various passions and emotions are the great causes of insanity—one cannot hesitate for a moment in concluding, that an intimate acquaintance with all the intellectual phenomena is absolutely essential for the Physician. I should hardly have deemed it necessary to take notice of French, had it not been mentioned by Mr. Colles, and had I not known Medical Students so ignorant of that language, as not to be able to benefit by the excellent works on Anatomy, Surgery, Pathology, Clinical Medicine, and Physiology, which have lately appeared in France, where translations also of Medical Books from the German and Italian are now very common. The subject which I next beg to say a few words on, is *Courses of Study*. I am inclined to think that the Course and Succession of Classes should not be left to the discretion or caprice of the Students, nor even to the judgment of their parents and friends. Students, unless guided by other persons more experienced, are very liable to commence the study of a subject before they are prepared, by acquaintance with what is introductory, or requisite for its being understood; so that much more labour and attention are demanded from them than would otherwise be requisite, or they never acquire a thorough and minute knowledge of what was thus prematurely attended to. This regulation of the Course of Medical Studies is adopted in the foreign Universities,—is attended with many advantages,—and cannot well be objected to as a despotic interference with the will and pleasure of the Students and their friends. Some discretionary power must necessarily be left with the Professors to modify the course, for those who may have previously attended some of the classes, and for some others who can give satisfactory reasons for exemption from the established rules. The duration of the Sessions should be regulated, as far as I can judge, either by Semestres, as in Paris, or should extend to five complete months, without any holidays, except Christmas-day and Good Friday, as I believe every teacher is aware of the bad effects of days of idleness, which are too generally those of dissipation, breaking in upon the regular habits of study and attention to business. Courses of three months should be relinquished, as there is no subject that can be taught with any advantage in so short a period, and it appears somewhat inconsistent to declare any part of medicine essential, that can be discussed in little more than ten weeks. I confess, that I have never been able quite to understand, by what rule, in the sale of learning, the quantity of knowledge obtainable in a three months' course, should cost the Students as much as the information to be derived from instruction of six months' duration.

Is there great variety, do you know, in the Course that is followed by young men here?—I never understood there was any particular Course here. They proceed either as they themselves think best, or by the advice of a Medical friend, or of their fellow students or friends.

There is not much uniformity, then, in the course followed?—I suppose not. I have often been consulted by young men as to the course they should follow in Medical study, and I found they had no views of their own. They were often anxious to begin at the wrong end.

What is the next subject on which you are to favour us with your observations?—I beg next to offer some remarks on *Examinations*. Examinations (without which, teaching by mere Lectures is apt to be very inefficient) appear to me very important for securing regular

547

University of Edinburgh.

Dr. J. H. Davidson.

15 May 1827.

attendance, which cannot be enforced either by monthly inscriptions, or occasionally calling the roll of students. They encourage study also, and attention during the prelections, by the emulation which necessarily takes place, and by the check upon idleness, arising from the public exposure of ignorance. They should be frequently, and at extra hours (except perhaps in the classes of Clinical Surgery and Medicine, where the Lectures cannot well be daily), and should be optional neither with Students nor Professors. Many of the former will be desirous to avoid these Examinations, for the very reasons on account of which they are recommended, *viz.*, the enforcement of regular attendance, and of habits of study and application; whilst the Professors (as Prunelle, a celebrated teacher, asserts) are not unwilling to drop the ceremony, as it is to many a very fatiguing, and, compared with teaching, a disgusting occupation, requiring a particular tact, got only by practice, with much patience and temper for its proper execution. If these Examinations be sufficiently frequent, and conscientiously carried on, the progress of the young men in their studies will be ascertained, and the discovery made, whether or not they have understood and profited by the instruction they have received; whilst the abuse, which I suspect still exists, will be avoided, of students preparing themselves by the continued and hurtful application of three or four months, in order to pass the final Examination, whilst three or four years may have been wasted in comparative idleness. Besides these frequent Examinations of a more familiar kind, a more solemn ceremony may take place at the end of the year, when the students would be obliged to give proofs of their proficiency in the branches of knowledge to which their attention had been directed. These Annual Examinations might be conducted by a Committee of the Professors; and the Students, besides being obliged to answer orally, might have written questions delivered to them, which they must answer without preparation, either in English or Latin; and this exercise, by which their proficiency in those languages would be ascertained, should be performed without their having power of getting assistance from others. By these methods, Students, who had been negligent, might be remanded to their studies, and thus, perhaps, reclaimed from idleness, with much less loss of time, with less disheartening disgrace than at present; whilst the Professors would be saved from those painful feelings, inseparable from the rejection of young men, whose deficiencies may have proceeded from want of capacity, as well as from inattention,—and who, besides having lost a great deal of time, may have wasted needlessly, in their Academical career, the means which their parents had some difficulty in supplying. In cases of incapacity, it is still of more importance to discover the inutility of bestowing time and money on what cannot be acquired, and by the system of Examination; I have mentioned this cause of failure would be easily found out, and the mortification, both to the Student and his parents, rendered less poignant, and less hurtful in a pecuniary point of view. I am inclined to think that all the Examinations should be in English, not in Latin, since the Lectures are not now, as formerly, delivered in that language, and as using it in conversation is completely relinquished in this country. The Classical attainments of the Graduates ought to be ascertained by other means than by their power of expressing themselves in Latin, which is not perhaps a correct test either of good or of bad scholarship, as many excellent scholars are unaccustomed to the exercise, whilst a few months' practice, with a Grinder, gives a degree of readiness in that kind of Latin with which the Examiners must be satisfied, to many who would make a poor figure in translating one of the Classics. The Professors, besides, will be better enabled to discover the Students' Medical knowledge when the Examination is carried on in English, as the young men (I speak from experience) are apt to misapprehend what is said in a dead language, whilst they are confused, not only from the flurry inseparable from the occasion, but also from the fear in some of them of committing gross grammatical errors. It appears to me, that the *Thesis* should be in English, not only because great shallowness and many defects are easily concealed under the veil of a learned language, but also because they are very commonly translated (besides being frequently composed) by the Grinders, at a considerable expense, which might well be spared for more useful purposes. I am also of opinion, that it would be much better if the publication of the Thesis were optional, as it can hardly be expected that young men, who have just finished their education can produce anything so useful, interesting, or original, as to do much honour to the University, or to be beneficial to the Medical world. I believe, indeed, that of the immense mass of printed Theses which have issued from the College, very few have been worthy of being saved from the usual fate of waste paper, though some may have been the ground-work of subsequent publications. The money expended upon printing, and frequently upon translating the Theses, would go far in defraying the charges of an enlarged Medical education; and these would be still further diminished by removing the stamp-duty upon the Diploma, which seems to be a partial and oppressive tax, whilst it cannot be of much importance to the Treasury.—*Outlines.* It appears to me, that every Professor should have Outlines of his Lectures, in which a condensed, but pretty full sketch, should be given of every subject taught in the Course, with copious references to the best writers on every important point. By such Outlines, the Professor is kept from wandering from the proper subject of his Lecture, and from needlessly encroaching on the provinces of other teachers in the University, whilst he is saved from the necessity of daily and tedious recapitulation, by which much time is often lost. In the Outlines also, the Student finds the means of reference to what he has heard during the day, without the fatigue of taking notes, and is enabled to study the subject better at home, if bad health has caused an interruption in his attendance upon the Lecture. By the list of Books in the Outlines, the class of Bibliography of some German Universities is rendered unnecessary, whilst the Student is directed to the best sources of information in the immense labyrinth of Medical Literature, where he is liable to lose himself in inextricable confusion, not only from the number of authors, but also from the opposite opinions of those whom he consults

University of Edinburgh.

Dr. J. H. Davidson.

15 May 1827.

without a guide. Some of the German Handbuchs or Manuals seem to me models of what Outlines should be.—*Theory of Medicine.* I conceive that the task of this Professorship should be confined to Physiology, or an account of the various healthy functions of the body, illustrated, when necessary, by experiment. We have only to consider the number and importance of the subjects of this Course, and the extensive labours of Haller, Adelon, Magendie, Bostock, &c., in order to conclude, that the science will give sufficient employment to the undivided attention of one teacher during five or six months, even supposing Physiology to be stationary. Progress, however, is making in this branch of Medicine every day, not only by the discovery of new facts, but also by the new views suggested, by more accurate observation correcting the fallacies of former established opinions. The science of Physiology, from its great extent and difficulty, will probably long continue wavering, and perplexed with uncertainty; so that whoever teaches it, must be upon the alert, in order to be acquainted with its advance or irregular movements, and to make the Students aware of all the improvements which are sufficiently substantiated. *Pathology*, Functional or Physiological, at present included in the Course of the Theory of Medicine, will fully occupy a separate Course of Lectures, which may be given either by the teacher of Physiology, or by another Professor appointed for that purpose, who may, at the same time, devote as much attention to Structural Pathology, or Morbid Anatomy, as may be requisite for the due illustration of the subject. *Therapeutics*, which include Diet, Regimen, and the general doctrines of Practical Medicine, at present taught also by the Professor of the Institutes, should be intrusted to the teacher of Materia Medica, which should be given therapeutically, or according to the general doctrines of the Application of Medicines, according to their supposed or ascertained influence on particular organs or functions. I next advert to *Clinical Medicine.*—A Physician may be very learned in Medicine, and yet be very ignorant how to alleviate or remove disease; hence the necessity of combining practical with theoretical knowledge, by attendance on the sick, and hence the great utility of Clinical lectures. At the bedside of the patients, the Student not only soon gets over the disrelish, and sometimes the alarm, which a near approach to disease occasions, but he also sees, and, as it were, touches the symptoms he has heard described in the lectures on the Practice of Physic, and he learns all the phenomena which are pathognomonic, but which no description can render intelligible, nor impress upon the memory. He compares all these with what he has learned from books, and soon discovers how little he should trust to general descriptions, as the symptoms vary in every individual from age, temperament, previous habits, and many other causes, both external and internal. He sees the influence of those medicines, with whose alleged virtues he has become acquainted, by the study of Materia Medica, and the general doctrines of Therapeutics, gets timely warning of the difference between the results of practice and the promises of Theory, and comes to learn that experience, enlightened by the knowledge of others, must be his chief guide if he wish to benefit his fellow-creatures in the line of his profession. Such being the importance of Clinical Medicine, I cannot conceal, that the manner in which it has been hitherto taught in Edinburgh, does not appear to me the best calculated for securing all the advantages to be wished for to the Students. The system seems to me radically defective, from too much being trusted to chance for the proper performance of so important a duty. The Medical Professors, including those of Chemistry and Botany, are, *ex officio*, Clinical teachers, and it may happen, that some of them may have no taste for such a situation, which they may either reject altogether, or fill it unwillingly, and consequently perform their task with languor and indifference: others, though able Professors in their own departments, may not have the talents suited for Clinical Medicine, may have had no experience before their appointment, and consequently may so manage the treatment of the patients, and the lectures to the Students, as to render their services beneficial neither to the one nor the other. It appears to me, besides, that the Medical Professors should be so occupied by the duties of their respective Chairs, as not to have time enough at their command for proper attendance in the Clinical wards, or for composing their lectures upon the cases under their care. To me, indeed, it is inconceivable how the Clinical teachers, during a visit of an hour or two, even with all the assistance derivable from their Clerks, can have opportunity for analysing the symptoms of a considerable number of cases with such accuracy as to enable them to form an opinion upon their nature, and to decide upon the treatment, of which a detailed account is to be given to the Students. In place of the present system, I cannot help thinking, that the appointment of a Clinical Professor, or perhaps better of two Professors, permanently attached to the Hospital, would be a very important improvement in the plan of Clinical instruction in the University. Such a Professor might continue to act as at present in the Infirmary, or have a separate hospital, in which there might be wards also for the Professor of Clinical Surgery, who has, on the existing system, the not very agreeable duty of commenting upon the treatment of cases under the charge of other practitioners. The Professor of Clinical Medicine should devote much of his time to the wards under his care—should lecture frequently, so that he may point out to the Students the important, but often transient changes in diseases. He should have frequent examinations of the Students upon the nature of the cases they witness—upon the motives for particular practice, with the distinguishing symptoms and probable termination of the complaints—and he should insist upon full and accurate descriptions of the morbid appearances discovered after death. Such a class would be useful, not only to the Students, but also to the public, as a great deal of information could not fail to be collected upon the most successful modes of practice, on the influence of the seasons and weather on the general health, with the rise, progress, and termination of epidemic diseases. I suspect that we must ascribe to the want of a permanent Professor of Clinical Medicine the dearth of Reports in Scotland, whilst these most useful of all medical publications abound in France, Germany, and Italy. Advantage would be derived from

University of Edinburgh.

Dr. J. H. Davidson.

15 May 1827.

each Clinical Professor (if two be appointed) having several Clerks, as the Students might be divided into parties, and attend them at their morning and evening visits; when, by hearing the examination of the patients, with the practice detailed in the reports, they would be more minutely acquainted with the various diseases as they occurred—more likely to understand the lectures delivered upon them by the Professor, and be less noisy and violent than at present during the Physcian's attendance, when the crowd and jostling not only disturb the sick, but also render the Students only distant spectators of what is going on. It appears to me, that the Clerks should either have taken out their Diplomas, or have attended at least for some time to Clinical Medicine, that they may be of use to the Students in the way of explanation when required, and that there may be no risk of the patients suffering from their inexperience, if medical treatment be requisite upon admission, or called for at any time during the absence of the Physician. I confess that I have some jealousy as to much being left even to the Clerks, without reference to the Clinical Professor, who should be fully and solely responsible for the treatment and welfare of the patients, and cannot approve of the foreign plan of trusting the sick to the management of the Students, however the Professor may superintend; as abuses may happen, and very disagreeable accidents be the consequence. I can see no advantage in having many patients at one time in the Clinical ward, fifteen or twenty affording sufficient employment for the most acute and laborious Physician, who has to examine the Students (who will be confused by a greater number), and to prepare two or three lectures every week. If the cases be judiciously selected, as age, sex, &c., diversify the same disease in different individuals, the Students are quite sure of seeing enough of that variety of practice which can alone be useful for beginners, as a skilful and experienced Physician (the Professor of Clinical Medicine should necessarily be so) will multiply and alter his modes of cure according to the variety of the symptoms. Such variety of practice is rational, is pointed out by nature, and forms the best method of teaching the Practice of Physic with success, being very different from that dissimilarity in treatment in which inexperienced Physicians are apt to indulge, when guided by their own theoretical views, or by the suggestions of others. I may perhaps be allowed to suggest, that the Dispensaries might be converted into a sort of auxiliary Clinical School, resembling the Polyclinic of the Germans. The Students might be encouraged and advised to devote some of their leisure time to such institutions, where the attending Physicians might give, if not lectures, at least very useful explanations of the cases, with the requisite treatment; and since these Physicians are generally junior practitioners, whose time is not, as I well know, very valuable, the fees demanded would not be very oppressive. Whilst the Students would be much benefited by attendance at such establishments, practical and experienced Physicians would be gradually formed, well fitted for supplying vacancies occurring in the Clinical Chairs of the University. I next go to the Class of *Practice of Physic*. As a complete view of this subject has never been taken in this University, it seems to be impossible to discuss so important and extensive a subject in five or six months, so that the propriety of devoting a second course of lectures to it appears manifest. In this, as well as in some of the other classes, it has been the custom to lecture twice a-day for a considerable time before the termination of the session, which shows a laudable anxiety on the part of the Professors to complete their tasks but which becomes fatiguing to the Students, who are apt, besides, to think that those parts of the course taught in so hurried a manner, are of inferior importance, so that they too generally become remiss in their attendance, or return home before the end of the Academical session.

Do you recollect what proportion of the course that ought to have been gone over by Dr. Gregory was occasionally omitted?—It is long since I attended the class. I should think, he did not go through two-thirds of it; and his course varied in different years. He never, in fact, completed his subject.

Have you ever had occasion to know, that Candidates for Degrees are sometimes examined with regard to the treatment of diseases of which they never had heard a word while attending the Medical classes?—I cannot state as to that.

Did Dr. Gregory supply, in the second year, what had been omitted the year before?—Some subjects omitted in one year he discussed in another; but I do not think he ever went over the whole. I do not like to say that positively; but such is my impression. If Students are only bound to attend one year, they might finish the Curriculum without hearing anything at all on the Practice of Physic in points of importance.

Supposing two-thirds only of the course gone over in one year, is a Student obliged to attend again?—I do not think so.

Then, one third of the subjects he may never have heard lectured upon?—And his knowledge of them may have been got from books alone, or in the Clinical wards.

What do you next proceed to make remarks on?—With your permission I shall make a remark or two on the study of *Anatomy*. These Lectures on the subject of Descriptive, General, and Pathological Anatomy, with such occasional Surgical and Physiological Observations as are naturally suggested by the parts under consideration, are quite sufficient for one Professor, and perhaps can hardly be discussed in one course of six months. The propriety, therefore, of separating Surgery from the Class of Anatomy, and confining so extensive and important a subject to another Professor, accustomed to the practice of the art, is, I believe, now very generally acknowledged. As the separation between Surgery and Medicine exists only in theory, and as it cannot exist in practice, except in large towns or in crowded neighbourhoods, I conceive that the education of a Physician and Surgeon should be nearly similar, if not entirely the same. Since diseases, which, at their commencement, do not require surgical practice, frequently escape, during their progress, from what is deemed, by some, the peculiar province of the Physician, (diseases of the eyes, throat, erysipelas, abscess, &c.) it seems absurd

University of Edinburgh.

Dr. J. H. Davidson.

15 May 1827.

that a Physician should be either unable or unwilling, from a false idea of his dignity, to give relief to his patient, without the assistance of a Surgeon. As a great proportion of the Edinburgh Graduates are to be general practitioners, and very few of them settlers in great towns, an acquaintance both with the Theory and Practice of Surgery seems for them to be indispensable. Many of them, besides, are placed in situations where a demand for a prompt decision is made upon them, where there is no opportunity for consulting with their brethren, and where surgical treatment cannot, frequently, be delayed, without danger or injury to the patient. Along with attendance upon the Professor of Surgery, the Students should, of course, frequent the Clinical Wards, where they will see the operations performed on the living body, with the various means employed in Surgical diseases, and where they will witness also the influence of Medicine on local disorders, and thus often learn the appearance, progress, cure, or unlucky termination of internal affections of the same nature. The Clinical Professor of Surgery will direct their attention to the most useful and interesting cases, explain to them the motives for particular modes of treatment, and will let them know when and why some of the diseases resist the operation of Medical management, and admit of no other remedy than the most severe of all,—Operation. *Practical Anatomy.*—Though Practical Anatomy has been left to the option of the Graduates, and classed along with some other subjects in the Statuta, I cannot help thinking that it is quite out of place, and that it is most important, if not quite essential to the proper acquisition of medical knowledge, as a minute acquaintance with the structure of the body, and of the relative position of parts, can be obtained only by dissection. Minute Anatomy is, in truth, the basis of Medicine and Surgery, as the structure and composition of the organs which perform the functions of the healthy body must be known, before we can ascertain the changes which take place in Disease, that are to regulate our modes of practice. To the Surgeon, it is needless to add, an intimate knowledge of Anatomy is, if possible, of more consequence than to the Physician; as, in operations, the mistake of a hair's-breadth may sometimes cause the death of the patient; and it is equally clear, that no Surgeon should presume to use the knife upon the living and sentient body, who has not acquired confidence and skill by frequent operations on the dead subject. As it will be nearly impossible for Practical Anatomy to be carried on to a great extent in the University, the Students must be allowed to get Dissection where they best can; and their proficiency might be ascertained, as in some of the German Universities, by their being obliged to dissect some part of the body, unless the Professors of Anatomy and Surgery be satisfied with the certificates they bring from the place where they have studied Practical Anatomy. *Chemistry.*—It may appear almost presumptuous in me to make any observations upon the subject of Chemistry, which is so admirably and successfully taught by Dr. Hope; but I will venture to remark, that, as Chemistry is so favourite and fashionable a study, a considerable proportion of those who attend this Class are general students, whilst the greatest part of the Course (from the wide and daily increasing range of the Science) is occupied with the general principles, and with their application to manufactures and the common arts of life, so that comparatively little attention is paid to Animal, Vegetable, and Pharmaceutical Chemistry. It appears to me, therefore, that a separate Course for Medical Students should be given, in which the application of Chemistry to Vegetable substances, so important for the study of Materia Medica, and to Animal substances, by which both Physiology and Pathology may be illustrated, would be discussed, whilst a part of the Course might be devoted to the Chemical preparation of Medicines. As Practical Chemistry is one of the most important subjects to which the Medical Student's attention can be directed, I think that this should form a statutory part of his education; but, from the number of Medical Students, they could not be accommodated in the University, and must be allowed to acquire their knowledge on the subject where it can be best and most conveniently procured. I believe, that, even in Edinburgh, a sufficient number of establishments for teaching Practical Chemistry would be opened, in no long time, after the demand was created by the Statuta Solennia. *Botany.*—The Course of Botany should be extended to six months, and should include, besides Terminology and Classification, Vegetable Anatomy, Vegetable Physiology, and Geography of Plants, with Horticulture, in its most interesting and important parts. Botany thus comes in contact with Animal Anatomy and Physiology, and also with Natural History and Comparative Anatomy. *Natural History.*—That Natural History must be useful to the Physician, appears from its including the History of Man, with all his varieties, and the modifications produced by climate and other causes. There is also the information to be derived from considering the habits, functions, structure, improvement, degradation, and diseases of other animals, not to mention Mineralogy, which treats of so many substances which are destructive to animal life, or useful as powerful remedies. In Medical Topography, also, a subject much neglected, but which is very important, both in a civil and military point of view, Mineralogy and Geology are of essential use to the Physician.

Might not such an extended Preliminary Education, preparatory to Medical studies, such as you recommend, have the effect of limiting very much the number of Medical Students, reducing it injuriously to the interest of the public?—If the change were to take place suddenly, without proper warning to the public, it might have that effect: but, I presume, the change would not be made without due warning, and in time for those coming to the University, who mean to be Medical Students, to prepare themselves accordingly.

Do you not think those who study Medicine are generally from a class of society as likely to be able to bear the expense of an extensive education, as those are who study for the Church?—From my own knowledge, I should say much more so—as they come in general from a class of Society able to afford it better than many who study for the Scots Church.

Have you made any observations in regard to the Class of Medical Jurisprudence?—I have; but I find I omitted to bring my notes upon it. It is a useful Class, but proper only for the last year of the Student's Curriculum. For the proper study of it, a previous knowledge

University of Edinburgh.

Dr. J. H. Davidson.

15 May 1827.

of all the subjects already spoken of is required. It should form a fixed part of Medical Education.

Have you any farther suggestions to favour us with, on the subject of Medical Studies?—I have only to offer now, in conclusion, a few observations on the influence of the proposed changes on the number of Graduates. *Influence of proposed Changes on Number of Graduates.*—I am convinced that the parents and guardians of young men intending to enter the Medical Profession, will not be alarmed at the proposed changes in education, unless these alterations be made so suddenly as to take them by surprise, or so extensive as to force the students to incur a considerably increased expenditure, with an unreasonable and inconvenient prolongation of Academical attendance. I conceive, that whatever changes are ultimately decided upon, due warning will be given; so that young men will have time to acquire preliminary education, who might not have thought such preparation necessary, under the present system. The period of residence at the University will not be much longer than is now required; and, though the expense, from enlarged education, may be somewhat increased, I feel pretty certain, that from the desire and value for knowledge now so prevalent, the public will see the propriety of Physicians keeping pace, at least with other classes of society, in Literary and Scientific acquirements, and of their being thoroughly instructed in all the branches of knowledge connected with their profession. Though other Medical Institutions, such as the College of Surgeons of Edinburgh, have essentially improved the education required from those who wish for Diplomas, and have consequently made those Diplomas of more difficult attainment, I believe that no falling off has taken place in the number of the Candidates; and I am inclined to think, that the more the respectability of Degrees is increased, the more will they become objects of ambition, and less grudge felt at any additional expense incurred by procuring them. I have heard of no diminution in the crowd of Edinburgh Graduates, after the fees were raised at once from three to four guineas, and after a heavy duty, in the shape of stamp, was laid upon Diplomas,—an imposition against which the Professors could not, unluckily, remonstrate, as they had, nearly at the same time, proposed to levy an additional sum of similar amount, upon the Graduates, had not the Students protested and the Patrons interfered. But, granting that the proposed changes in Medical Education should have the effect of lessening the number of the Graduates, I am not aware that such a result would be a good argument against the propriety of the measure. The University is bound to do its duty to the public, by taking care that no Physicians leave its walls, who are not qualified in every respect to be safe and useful Practitioners of Medicine. Its honour and respectability seem to depend, not so much upon the number as upon the quality of its Graduates; and it ought to give an example to, instead of perhaps being obliged ultimately to copy, other Institutions, which the public voice will, I trust, in no long time, compel to raise the standard of education to what is now required by the Naval and Military Medical Boards, before which an Edinburgh Graduate, with the qualifications at present required, cannot appear, from not possessing sufficient Literary, Scientific, and Medical acquirements. If other Institutions do not voluntarily improve their system of education, the Legislature must interfere for so necessary an end; and, as it has thought proper on one occasion to meddle with such matters, and pass a most injudicious Act in favour of the English Apothecaries, to the great injury of Medical respectability and the public interest, it seems bound to retrace its steps, and to make new enactments for the proper regulation of Medical Studies over the whole kingdom. As to a plan which has been suggested, of having two or more Degrees in Medicine, I confess that I cannot see the utility of such a measure. I conceive that no man who is not fully educated, and capable of managing the health of the public, should be let loose upon society, to which he cannot fail to be dangerous. If men, deficient in certain requisite branches of Medical knowledge, get the privilege of practising, proper attention to the interests of the public renders restrictions necessary, that they may be prevented from going beyond the bounds of their skill and information, in the exercise of their profession. Such ordinances exist in France and Germany, where inferiorly-educated individuals are allowed to practise; but, as far as can be judged from the opinions and complaints prevalent in those countries, the regulations are constantly infringed. Much bad humour exists between the fully and partially licensed Practitioners; and the result seems to be, that the Medical profession is degraded, both really and in public estimation; whilst the general impression is, that such inferior Degrees should be abolished. I cannot help concluding, therefore, that there should be only one Medical Degree in the University of Edinburgh, which is to ensure complete education in all who have a Diploma; and that the possessors, most of whom are to be general Practitioners, must take their stations in society according to choice, talent, the accidents of fortune, public opinion or caprice, and their own exertions, or the recommendations of their friends.

What would you propose as a proper Course of Medical Study?—I have made out a sketch, and it as follows:—

Preliminary—Greek, Latin, French, Mathematics.
Collateral, sometimes *Preliminary*—Natural Philosophy, Logic, Moral Philosophy.
Medical Classes—Anatomy, two courses; Practical Anatomy, ditto; Practice of Physic, ditto; Chemistry, ditto (General and Medical); Physiology; Pathology; Materia Medica; Clinical, Medicine, two courses; Clinical Surgery, ditto; Surgery; Botany; Natural History; Midwifery; Medical Jurisprudence; Practical Chemistry.
1*st Winter*—Anatomy, Chemistry, Natural Philosophy.
1*st Summer*—Botany, Natural History, Medical Chemistry.
2*d Winter*—Physiology, Pathology, Materia Medica, Ethics.
2*d Summer*—Practical Anatomy, Practical Chemistry.
3*d Winter*—Practice of Physic, Surgery, Clinical Surgery, Logic.
3*d Summer*—Practice of Physic, Clinical Medicine, Surgery.

University of Edinburgh.

Dr. J. H. Davidson.

15 May 1827.

4th Winter—Anatomy, Clinical Medicine, Midwifery.

4th Summer—Clinical Midwifery, Clinical Surgery, Medical Jurisprudence.

The Course of Studies which you recommend will occupy for its completion ten months in the year, for four years?—Yes.

Does not this scheme, which you now propose, proceed on the supposition that the Preliminary Education has been less complete than is now recommended?—Yes; the sketch is, of what should be attended by those who have not been acquainted with the subjects before coming to the University. I need not say that I made out this with diffidence, as considerable difference of opinion exists, I believe, amongst individuals more capable of judging than I can pretend to be, as to the connexion and succession of the branches of study which have been recommended.

Is not Logic put in late?—I have placed Logic after Moral Philosophy, from the idea, that what may be called the Descriptive Anatomy and Physiology of Mind should be studied, before attending to Logic, or those rules for best employing the mental functions in reasoning and the accumulation, arrangement, and communication of knowledge.

Do you recommend that Students should avail themselves of Private Lectures?—By all means.

Do you think that the attendance on such private teachers as the University should fix on should be esteemed a regular course?—I should think such attendance might be taken for a second course. I think that the first course should be in the University, and that the second might be with a respectable private teacher. That would be useful for both Students and Professors, as there would be a competition in the performance of duty.

In reading works on Surgery, have you ever found that practices are occasionally recommended, which betray complete ignorance of the principles of Mechanical Philosophy?—There is an affection called Emphysema, in which air escapes from the lungs into the cavity of the chest, and into the cellular substance of the body. The rationale of the symptoms, and the treatment proposed, appear to have been erroneous, from ignorance of Pneumatics, and of the Mechanism of respiration.

Do you not think that more than a superficial acquaintance with Physical Science is necessary, if it were only for the purpose of checking the progress of extravagant and irrational opinions on such subjects as Animal Magnetism, Animal Electricity, Lunar Influence, and what has been called Sol-lunar Influence,—and for enabling Physicians easily to refute and demolish the absurd theories which are often started on many other subjects of Medical inquiry?—I would answer, decidedly so. A man, in fact, who has a due proportion of general knowledge, is less liable to be misled by improper theories in Medicine.

Have you now gone over all the subjects on which you proposed to favour us with your observations?—Yes. I have thus ventured to speak successively on these heads—Preliminary Education, Mathematics, Natural Philosophy, Moral Philosophy, Courses of Study, Examinations, Theses, Outlines, Theory of Medicine, Clinical Medicine, Practice of Physic, Anatomy and Surgery, Practical Anatomy, Chemistry, Botany, and Natural History.

The Commissioners are very much obliged to you for your excellent observations.—I have stated them not without the greatest diffidence, as the important and difficult subject of Education has only occasionally attracted my attention.

George Dunbar, Esq., Professor of Greek in the University of Edinburgh, called in and further examined.

Professor Dunbar.

Are the Elements of Greek taught in your Class?—Yes.

One object to-day, is to have your ideas as to the propriety of that plan,—whether you think it better the Elements should be taught in the First Class, or, whether it should be required of Students coming to the University, that they should be previously acquainted with the Elements of the Greek Language?—It would certainly save me some trouble, if they were previously taught in some of the public schools; but, I apprehend, the Elements of Greek must continue to be taught in the University.

State your reasons for thinking so.—In some of the public schools, as the High School of Edinburgh, and the New Academy here, and schools in some provincial towns, Greek is taught to a considerable extent; and such as are there taught the usual time, may with propriety at once, on coming to the University, join the Second Class, where the Elements are not so much insisted on. But, in the parochial schools in Scotland, I believe, a very considerable number of schoolmasters are not capable of teaching Greek, so as to enable pupils to attend my Second Class with advantage when they come to the University; and I judge so from several of the Students who enter the junior Class.

But, do you think, if, according to the strict rule of the University, the Professor of Greek were to begin with the higher authors, that men would not be found as schoolmasters in the country, capable of teaching the Elements?—Not unless they get far more encouragement than at present.

Would not the circumstance of it being the practice in Scottish Universities to require of Students a previous knowledge of the Elements, necessarily lead to that?—The salaries of parochial schoolmasters are small, and their school-wages low; consequently, it is not probable sufficiently well educated teachers could be got; and, in country parishes, young men farther advanced in life attend to other branches of knowledge, which keeps them back in their Classical education; whereas, in large towns, in the public schools, Classical literature is the principal object attended to.

But, without confining your attention to parochial schools, would not there be a supply of good teachers for the Elements of Greek?—If there were a sufficient number of scholars

University of Edinburgh.

Professor Dunbar.

15 May 1827.

and due encouragement, there might; but I question whether a sufficient number of pupils could be got.

Perhaps not in many country parishes,—but in county towns for instance?—Of young men from those towns, I have found a considerable number who have joined my Second Class on coming to College; but I have also found, from the same places, a considerable number who were obliged to go to my First Class. I stated, formerly, that my First Class is divided into two parts. The first consists of those who have learned the greater part of the Grammar, but are not sufficiently grounded and prepared to go to the higher Class; the other part consists of those who had not studied the Elements at all, or who have proceeded but a short way in them. The first division have their attention directed to reading some of the easiest books, besides learning the Grammar; the other division go over the Grammar at the same time with the advanced side, and afterwards join them in reading some of the simplest authors. I found, at first, that the proportion of the two parts of the Class was nearly equal; but, for some years past, the number on the less advanced side has been diminishing. This year it is about a half less than the other,—a proof that more attention is now paid to teaching Greek than formerly. But matters are not yet in such a state as to recommend the removing the Elementary Class in the University.

If warning were given that the Greek Class was to begin with more advanced authors, as Homer and Herodotus, Xenophon and Plato, would not that induce teachers in different towns to prepare the young men to be enabled to be as far advanced with relation to the Greek Class in the College, as is the case in regard to the Latin Class?—They do not begin the study of Greek as soon as the Latin. It would be impossible to study English, and some other necessary branches, at the same time with them both; and for this reason,—the study of Greek is not so soon begun as that of Latin. A great number are not able to join my Second Class; and I doubt much whether, as schoolmasters are appointed and encouraged at present, it would be possible to make the case otherwise.

But, as things are at present, is not there rather encouragement not to begin Greek before going to College?—I know of no direct encouragement. Even at Edinburgh, where in the High School Greek is taught to a greater extent than in most public schools—even from that Seminary a considerable number join my First Class. I may mention, that I have considered the numbers educated in Edinburgh, who have joined my Classes, compared with those who come from the country. My first Class, taking an average of 10 years, consists of about 140. The number in that Class, who have been educated at Edinburgh, is not more than 30. That forms only about a fifth part of the Junior Class. Therefore the condition of the country, as well as the town, must be taken into view in considering this matter. The Second Class and Third together consist of upwards of 200; and the number of those educated in Edinburgh, does not amount to more than 50, or a fourth part of the whole. So that Edinburgh furnishes a small proportion of those who join my different Classes.

Do you think that a course of two years, having a session of six months each, is sufficient for a young man to acquire a complete knowledge of Greek?—That must depend very much on himself; for he should do as much or more by himself, than while under the Professor. I am sorry to say, that a number, having in view professions not requiring an extensive knowlege of Greek, do not pay so much attention as would be desirable. I do not, however, consider two years sufficient to give a competent knowledge of Greek, and far less a complete knowledge. But I have three Classes; and it is in the option of any one, qualified to attend, to join whichever of them he pleases. Students may go at first to the Second Class; and those who do so are more numerous than formerly. They may join the Third Class, and attend there as often as they choose. The majority of Students attend two years. Many attend only one year, but some three, four, and even five years.

Do Students generally attend two years?—Yes, although a considerable number attend only one. One session qualifies to enter the Divinity Hall. Such as enter to the profession of a Writer to the Signet, find one year sufficient, and sometimes they do not attend any longer.

Do you conceive a single course of six months, is able to give a Student any thing like a competent knowledge of Greek?—If any one join my First Class, and be obliged to go through the Grammar, and read a little of the Collectanea Minora used there, he must know very little of Greek.

Do you think two years' attendance, supposing he attend your two first courses, adequate to give him a competent knowledge of Greek?—In that time, if he has tolerable abilities, and has paid due attention, he may be able to read Xenophon, the Iliad and Odyssey of Homer, perhaps Herodotus; but not the higher authors, as Demosthenes, Thucydides, or the dramatic writers, and cannot therefore be thought to have a competent knowledge of Greek.

According to the practice in Scotland at present, you say young men generally attend two years; have they an opportunity of making themselves accomplished Greek scholars in that time?—They have the opportunity, but scarcely the time.

But, according to the ordinary practice, is this seldom the result?—It is not often the result; but I hold want of inducement to cultivate Classical Literature, to be the great drawback under which we labour.

Supposing a young man has acquired all the elementary parts of the language at a parochial or other school, or in any way, before going to the University, might not he employ three years there with great advantage, in the study of Greek?—I think he might. There is nothing to prevent him in this University. Some have attended me four years—a few have attended five years. A considerable number who enter the First Class go afterwards to the Second, and from that to the Third. A greater proportion enter the Second for the first time; and a considerable number of those go to the Third, generally averaging about seventy

University of Edinburgh.

Professor Dunbar.

15 May 1827.

or eighty. I do not believe more than five or six enter the Third Class for the first time. They go from the Second to the Third; and, after attending two courses, they may join the Third as often as they please, without paying any thing more than the class-dues. I might demand a fee, as it is a totally different course, yet I have granted this privilege to those who have attended two courses previously. I take only the ordinary dues.

Is that voluntarily?—Yes. It is a private class, and different from the first.

Is your reason for not abolishing the Elementary Class, solely that a sufficient number of teachers could not be procured, from whom young men might learn the Elements before coming to the University?—There is nothing in the world to hinder those who choose to go to the Second Class, from doing so at once. They join the First because they find themselves not qualified to join the Second. I do not know what effect might be produced by encouraging parochial teachers; but I have not hitherto found many pupils from their schools qualified for the Second Class.

Supposing sufficient teachers could be procured, by whom the Elements might be taught, that would render it unnecessary to have an Elementary Class in the University?—If the Elements were well taught by teachers, it would. But, even from Burgh schools, a number come to the University not sufficiently grounded in the Elements to go to my Second Class at first. If there were not a Junior Class, the consequence would be, that they would go to the Second without being sufficiently qualified. I may be mistaken, but I consider my proceeding with the Elementary Class to be different from the practice in public schools. The teachers in them are more limited in point of time, and cannot go over the rules and examples so minutely as I do; and I make observations that enable the Students to understand the principles better than they could do, where the teacher is limited in point of time, and perhaps has not studied them so minutely.

Supposing persons qualified to teach the Elements of Greek, could it be done with most advantage in the mode followed in College, or in the mode that may be followed in a Grammar School; in the one case, the boys being generally occupied only one hour a-day, while, in the other, they are under different discipline, and their whole time occupied?—I conceive they may be better taught in College than at School. I have two hours in my First Class, and that is an hour more than in the High School at present, and half an hour more, I believe, than in the Academy. I go over more ground in six months than is done there in nine or ten. As to discipline, a considerable proportion of my Junior Class are too far advanced in life to be subjected to the discipline of a public school. There are several every session, apparently 18, 19, and even above 20 years of age.

Is not the more advanced period of life, when your young men commence the study of Greek, a disadvantage to their progress in the language?—I consider it otherwise, as they must have then acquired more knowledge of their own language, which is essentially necessary, and more so than either Latin or Greek. I reckon the obliging pupils to study Latin and their own language and Greek at the same time, as calculated to give them little knowledge of any of them. Young men, studying their own language, along with Latin, for four years, and then commencing the study of Greek, will make more progress in the latter language in the space of two years, than if they had begun it two years earlier. Such is my opinion at least.

But, if it was the practice to attend six years instead of four, before coming to the University, would it not be better than at present?—Perhaps it might. It would depend on the constitution of the school, and the manner in which it was managed.

According to that view of the subject, how would you explain the admitted superiority of English boys in Greek?—They continue the study there much longer.

But, taking the same period of life; there they begin early?—I do not admit the superiority: at least, I have never seen any evidence of it. I think I could produce some of my students, of three, four, and five years, and could pit them against English boys, at any of the public schools. But a great proportion of my students attend only one year, and others only two. Six months for one year, and six for another, cannot give a competent knowledge of Greek literature. But those who have attended three, four, or five years, as is done in the public schools of England, may be pitted against any of the English scholars.

As your objection to abolishing your First Class rests on the inability of parochial teachers, should not the same reason render it necessary to have the Elements of Latin taught in the College, as many teachers in the country cannot teach Latin?—Perhaps it might. And, to my own knowledge, some of those who come to learn Latin in College here, would be better employed learning the Elements; but, from their time of life, they could not well go to a public Academy. Some of them are often self-taught, and very ill founded. They could not go with boys to first and second forms. Many of them are bad scholars, and are unable to read the Grammatical Exercises.

Is not an Academical education very much thrown away upon such persons?—Yes.

Is your Greek Class attended by many young men, who have not been taught by Schoolmasters, but by Students, who, during the Summer months, taught in the country?—Sometimes that happens; but not generally.

What proportion of Students entering the First Class have studied at country schools?—I stated already the proportion. The proportion educated at Edinburgh is about a fifth of the First Class, and about a fourth of the Second. About fifty or sixty joined the Second or Third Class, who were educated in Edinburgh. About thirty of the First Class had been educated here. All the rest were from the country.

Have you the means of distinguishing how they were taught in the country?—I seldom put questions to them to ascertain that. I believe some are privately taught; and those who are so taught, are best taught. I know, that in many of the parishes, those young men who teach, are supported by subscriptions. They carry on their education at the same time.

555

University of Edinburgh.

Professor Dunbar.

15 May 1827.

During winter they find a substitute, and attend College; and they go back to the country in summer. They gradually work themselves forward; and, from this class of persons, better instructed pupils come to the University from the country than formerly. I remember, in my own native county (Berwickshire), few Parochial Schoolmasters could teach Latin; few or none could teach Greek. I received the first part of my classical education from a teacher in a remote village, and was obliged to travel two or three miles in order to get that education, as the Parochial Schoolmaster could neither teach Latin nor Greek. Little encouragement is given to Schoolmasters in many parishes. In several places Candidates for the Church are even excluded from becoming teachers of public schools. I conceive, a worse policy than this could not be adopted; as such persons are best qualified to teach parish schools. I may just state, that if the Students were *obliged* to attend my First Class, then there might be a question of the propriety of continuing it: but they are not obliged to attend it; they join it as they find themselves not qualified for the higher. They are under no other necessity of attending it, in preference to the classes for more advanced students; but, from the manner in which it has hitherto been attended, I consider it absolutely necessary, in the present state of Classical knowledge in the Parochial and Public Schools; and I can anticipate no change in them so extensive as to render its extinction probable, without manifest hurt and injury.

Do not the hours of attendance of your Classes interfere with some of the Latin Classes?—We have endeavoured to prevent that, but have not altogether succeeded. The First Classes of Greek and Latin do not meet at the same time; but the Second Greek and the First Latin Classes meet at the same hour; and I have heard complaints from parents, that they wished their children to attend the First Latin and the Second Greek Class at the same time, but that the hours interfered, and rendered it impossible. From the number of Classes taught, and the limited time we have at command, we have not been able to effect a different arrangement.

Notwithstanding the acknowledged eminence of the Greek Professors in Scotland for the last fifty years, in all the Universities, is it not your opinion that the state of Greek Literature in Scotland is very low?—I must say that it is low, and I attribute that to the little or no encouragement given to Classical Literature. Those who may be considered the best Greek scholars, study for the Church, but they are not obliged to study longer than the law of the Church requires, and to answer the Examinations, which are not severe. In England they have Scholarships, Bursaries, Exhibitions, Fellowships, Church-livings, &c. We have none of these; so that there is no encouragement here for Classical Literature. Those who join the Latin and Greek Classes, do so merely to qualify themselves for some profession, and they look no farther; but, in England, they know they must be good Classical scholars, before obtaining Scholarships, Bursaries, Fellowships, or admission into the higher ranks of the Church.

Was not there a time when Classical Literature was cultivated here, as much as in England?—Not to my knowledge. I have no evidence that Greek at least was cultivated to a greater extent in the Universities than at the present day. In judging of the extent of Greek Literature, as taught in our Universities, it appears to me that the *Junior Class* is generally taken as the criterion, than which nothing can be more erroneous and unjust. There are several eminent scholars in England; but fewer, in my estimation, than in Scotland, considering the immense advantages they possess over us. It is not so easily known, I believe, what progress young men, in our Universities, make in respect to Greek. In England they are examined publicly; and that must be before obtaining degrees, honours, and distinctions. Here there are no such public examinations, and no inducements; and, therefore, the knowledge of Greek they may possess, is known only to the Professor and the Students. In my Third Class, however, I have a considerable number who write Greek Essays,—not correct, certainly, but they make the attempt; and they also write Greek Poems. There were, of both, nearly thirty this season, and some very creditable. I offer a medal for the best Greek Essay or Poem which the Students may produce. The Students in that Third Class read Sophocles, Æschylus, Euripides, Aristophanes, Thucydides, Demosthenes, &c.; and that, I conceive, is as much and as well done as in most English Seminaries.

At the time when the character of Scotland stood highest for Classical Literature, what was then the encouragement it received; were there inducements, such as you have mentioned?—I do not know that there were the same inducements as I have mentioned; but there were others. The Reformation in Religion, which was supported and aided by Classical Literature, was a powerful stimulus. Indeed, at the period alluded to, Classical Literature alone was studied; and those who were distinguished by their attainments in it, were courted by the great and the mighty, as powerful instruments for forwarding the cause of religion, &c. I believe, however, that in Scotland, in the present day, *Greek Literature* is known to a far greater extent than at that period. There were a few eminent scholars, such as Buchanan, Melville, &c.; but the knowledge of Latin was far more extensive and accurate than of Greek. I must be allowed to state again, that the character of this country, for Classical Literature, cannot be expected to stand much higher than at present, unless far more encouragement is held out, both in our Schools and Colleges. The best of our youth are sent to the English Schools and Universities; and yet, when they have returned to Scotland, I have never heard that they very much excelled those who took their chance at home. But such a practice is *discouraging*, as, if they were educated here, *they could afford* to remain longer both at the Schools and Colleges, and thereby do us more honour than such as are forced to relinquish their studies to follow certain professions. In the English Universities, Scholarships and Fellowships, of £200 or £300 per annum, may well demand a greater extent of Classical erudition than we can afford to reach.

University of Edinburgh.

At a Meeting of the Commissioners at Edinburgh, on Tuesday, 29th May 1827,

Dr. COOK in the Chair,

[There not being a quorum of Commissioners, those present resolved to examine the following Clergymen, who were requested to attend this day, viz., Professor Alexander, of St. Andrew's; the Rev. Matthew Leishman, Govan; the Rev. George Hamilton, Kirkcudbright; the Rev. Thomas Brown, St. John's, Glasgow; and the Rev. Andrew Bulloch, Tulliallan; all of whose residences are distant; and to report their Evidence to the Commission. Minutes of their Evidence were accordingly reported to a Meeting of the Commissioners, held on 10th July 1827, and received by them, and ordered to be printed.]

Professor Alexander. 29 May 1827.

Andrew Alexander, A.M., Professor of Greek in the United College of St. Andrew's, called in and examined.

At what time were you a Student of Theology in Edinburgh, and who was Professor of Divinity at the time?—I attended the Divinity Hall during the session of 1808-9, the last year of Dr. Hunter's Professorship; and I had previously attended the Divinity Hall at Glasgow, several sessions, under Dr. Findlay.

Will you be so good as communicate to us any information you are possessed of as to the formation and history of the Theological Library?—I was at no time, and am not now, acquainted with the history of the Library.

While you were here, were there discontents among the Students as to the management of the Library; and, if so, what was the nature of those complaints; do you know?—They complained, whether rightly or not I cannot say, that the funds were improvidently managed; and that, in consequence, the additions made to the Library were not such as might have been reasonably expected. They farther complained that they were not allowed a share in the management of the Library.

Did they claim to have a right in the management of the Library; and upon what grounds did they rest that claim?—If my recollection serves me, they rested partly on a claim of *right*, in consequence of the Library being altogether supported by their annual subscriptions. They thought they had some right to the management; and they considered that, on principles of expediency, it would be better to admit them to a share, at least, in the administration.

Were the accounts of the Library Expenditure submitted to the Students?—No; they were in no degree consulted on the subject, nor as to the general management.

No information was given them of the books purchased, and they had no choice in them?—No.

Did they send any remonstrances to the Professor on the subject?—Yes. Several meetings of Students were held, and they sent representations to Dr. Hunter, suggesting generally that it would be advantageous if the Librarian and Library were put in some degree under the control and management of a Committee of Students.

Do you remember his reply?—He was unwilling to denude himself, in any degree, of the sole and absolute power which had been transmitted to him from his predecessor in office.

Were those complaints of the Students of recent origin, or not; do you know?—I am not aware that they had existed only during Dr. Hunter's incumbency. I rather think I have heard they existed prior to it; but I cannot speak positively to the fact.

Do you know any circumstances that led to those remonstrances?—I believe Dr. Hunter, that year, increased the subscription by his own authority; that the Students were required to pay to the Library a sum raised by him, (I think from 5*s.* to 7*s.* 6*d.*,) which led the Students to inquire whether they ought not to have some share in the management.

Did you ever see any Constitution of the Library on which the claim of right was founded?—No; but I understood the Students had obtained some documents which they thought supported their pretensions.

And do you know where the constitution was at that time?—No. I think the students were then very much in the dark as to their rights, or whether they had any at all. They went very much on views of expediency.

When you speak of a share in the administration, do you mean of funds, or the general management?—The general management;—that their Committee should have the general superintendence of the Library—should be empowered to review the Library annually, or oftener, if they thought proper, in order to ascertain the state of the books, and whether any were missing—and should act as a sort of check on the Librarian in the exercise of his office.

Did you think the students ought to have had the selection of books?—At that period I thought the students should have power to select books, subject to control on the part of the Professor.

Was it for exclusive management the students contended, or for management in connection with the Professor, or subject to his control?—They were altogether excluded from the management in any part; and they would have been satisfied with a participation along with the Professor, or the Theological Faculty.

Are you acquainted with the state of the Theological Library in Glasgow?—Yes. I acted as a member of Committee there for three or four years.

Do you consider the management there more satisfactory than at Edinburgh, while you attended the Hall here?—Certainly, that is my opinion; and, in proof, I may mention that, during the whole time I was at Glasgow, I never heard the least murmur as to the administration of the Library; nor do I know that any complaints have ever been made on the subject in any quarter.

As a general principle, do you think it would be desirable that the choice of Theological books should be committed altogether to students of Divinity, many of whom are only entering on the study?—On reflection, I am doubtful whether the students would undertake the

557

University of Edinburgh.

Professor Alexander.

29 May 1827.

drudgery, without being allowed in some degree, to participate in the privileges of office. To speak frankly, I would not be afraid to intrust the Committee of students with the power of appointing and paying the Librarian—of managing and disbursing the funds—and even of selecting the books, subject in all cases to the review and control of the Theological Faculty. Were the constitution even as free as it is at Glasgow, it would be found, I believe, that but a small proportion of junior students would find their way into the Committee; and, judging from my own experience, I know not that a system of management could be devised, better fitted every way, to attach the students to the interests of the Library, and to secure for it the benefit of an effective and vigilant superintendence. As a proof of the feeling of interest which it creates in favour of the Library, I may mention, that students who have studied Theology at Glasgow, and who may afterwards have become authors, have seldom failed to present a copy of their works to the Divinity Library. I think the better plan would be, to give the selection of books to the Theological Faculty; and, as to examination of the state of the books, to intrust that to a Committee of the students, which would take a duty of mere drudgery from the Professor.

Had you any reason to think the Librarian was not sufficiently qualified, or attentive, while you were here?—The Librarian was chosen by the Professor of Divinity; and charges were sometimes thrown out that he acted with partiality in giving out books; but I cannot take it upon me to say that those charges were well founded.

Was no inconvenience experienced at Glasgow, from the circumstance that a proportion of the Curators there consists of very young students?—It accords with my own experience, that the Curators and Managers are selected from more advanced students. I do not remember that a first year's student was ever admitted into the management. There might be one or two of that description, but the far greater proportion were more advanced students.

But did no disadvantage arise from this circumstance, that, as the advanced students were soon to remove, there must have been great fluctuation in the management?—No inconvenience was felt from that circumstance. The Committee of Management consisted generally of second, third, fourth, and fifth year students; and, as the Committee was small in comparison with the total number of Divinity students, the places of the few who retired annually from the management, in consequence of their having finished their studies, were easily supplied from the more advanced students.

Did the students here found their claim to share in the management of the Library, on having contributed solely?—No, but likewise I should say, chiefly, on views of expediency. It was their opinion that the Library would be managed in a more satisfactory way, and a greater and more constant vigilance be exercised by a Committee of Management than could be reasonably expected on the part of the Professor.

If they had a claim on that ground, would not other *Cives* have a claim too—persons in the town who may become *Cives*—if it be permitted to persons in town to become *Cives* in this Library, as it was in 1757?—That, I believe, is not according to the rules observed at Glasgow. None but students of Theology can have the privilege of admission to the Theological Library there.

There is a copy of the Regulations of the Divinity Library of Edinburgh in 1757. Please read Rule first?—"That every student pay half-a-crown at his entry each session; and any other person may have admission to the Library at the same rate."

There were none others in your time connected with the Library, than students of Theology?—Not that I was aware of. The admission of other persons than students of Divinity to the rights of the Library, was allowed probably with a view to foster an infant establishment, at a time when the number of Divinity students was comparatively few, and when the funds were small. But, at present, I should hold the admission of aliens to the rights of the Library inexpedient and unnecessary.

Was the dissatisfaction here chiefly on the part of students from Glasgow?—It was principally students from Glasgow, Professor Buchanan and myself, that began the agitation of the question, or rather suggested what we considered would be an improvement in the management of the Library. We had both of us been members of the Committee of Management at Glasgow; and, being satisfied the Library there was judiciously managed under that system, and finding dissatisfaction at the management here was generally expressed, we thought the plan that suited Glasgow would here be of advantage.

In reference to dissatisfaction at a former period, did you allude to the time when Dr. Baird and Dr. Finlayson were students here?—I cannot say. I recollect having been told that dissatisfaction as to the management had existed under Professor Hamilton. His name was mentioned. I did not hear the names of any of the students who expressed dissatisfaction at that time. In consequence of the agitation of the question then, it was rumoured, and generally believed in the Hall, but on what grounds I could never learn, that the students of Divinity had been admitted to a share in the management of the Library; and this encouraged the students of my time to reclaim, and, if possible, to recover a privilege which, as they believed, their predecessors had enjoyed.

The Rev. *Matthew Leishman*, Govan, near Glasgow, called in and examined.

Rev. M. Leishman.

What time were you a student of Theology here, Mr. Leishman?—It was during the session 1812 and 1813, and the three following years.

Of course you studied under Dr. Ritchie?—Yes.

Was your attention much directed towards the state of the Theological Library, when a student?—It was, during the second year of my course in particular. There was a public meeting of students called to consider the state of the Library, and I attended that meeting.

What was the nature of the discussions that took place there, and of the claims preferred?

University of Edinburgh.

Rev. M. Leishman.

29 May 1827.

—It was thought the students had a right to a part of the management at least; and there was an old Regulation-book produced, which we thought authorized us to prefer a claim of that kind.

Was your right chiefly founded upon that, or was there any original charter or document referred to?—My recollection is not minute on the subject. But the origin of the Library was mentioned at that meeting. I recollect it was stated, that a former Professor of Divinity had been furnished with money by the students, on a visit which he was about to make to Holland,—that, with the money so obtained, he purchased books, which laid the foundation of the Library.

Then they founded their right chiefly on that?—Upon that and the Regulation-book, so far as I recollect.

What was the nature of their complaints at that time?—They imagined they had at least a right to be associated with the Professor in the management of the Library; and they complained of being deprived of that right. They likewise complained that a sufficient number of new books were not bought.

Did they wish to acquire the complete management, or have it under a control?—I think they submitted to Dr. Ritchie that he should draw up a constitution, and conjoin them with himself in the management.

You said there were complaints about books; did they relate to the mode in which the books were chosen and purchased?—There were few new books brought to the Library. It was known the revenue was considerable; and we were led to suppose, that the number of books brought in was not equal to the revenue. There was some idea of that kind.

Did the students at that time wish to have the choice of the books in the Library?—I think they did. I remember some students from Glasgow conceived that the system of management there was a good one, and that that system might be with safety adopted in this University.

And that opinion rested much on their notions of expediency?—Of course with those individual students.

What steps were taken by the students to obtain their rights, or to procure the change they wished?—A meeting was called to consider the state of the Library. Dr. Ritchie, however, would not allow us to meet for that purpose in the Hall. We therefore met in a large room in the neighbourhood,—entered into resolutions,—and appointed a Committee to present them to Dr. Ritchie. This the Committee did. Dr. Ritchie, however, did not give us an answer to those resolutions immediately, nor a direct one at any time; but he wrote to me personally, as I happened to have been in the chair at the meeting, a letter, by which he made us to believe, that our claims would be recognised and considered; but that letter has gone out of my possession.

Have you any reason to know whether the right of the students was recognised by former Professors?—We were led to believe that it was.

Was that claim to be elected curators of the Library ever carried into effect before the period you were a student of Theology?—The printed regulations I spoke of, declared that curators were to be chosen from among the students; but I cannot say, from my own knowledge, whether these were ever acted on.

Do you know of any resolutions of students, as to the Library, in former times?—Nothing particularly.

Had there been considerable discussions among the students as to the Library, before you came to the Divinity Hall?—There had. The state of the Library had been frequently talked of; and it was thought there might be improvements made,—that the funds were considerable,—and that these might be expended with more advantage.

In what manner was the Librarian then chosen?—He was appointed by Dr. Ritchie.

Was there any complaint that he was negligent of his duty?—I do not remember anything of that kind.

You got books readily enough?—Readily enough.

Do you happen to know the kind of management that prevails at Glasgow?—I have a general idea of it. It is entirely in the hands of the students, or a Committee appointed by them. The Librarian is elected by the students. He is usually a bursar. The bursary is given him as part of his salary. And the Professor of Divinity there has no control over the Library, not even a negative as to books.

From your knowledge of the general attainments of students of Divinity, do you think the selection of books may be better placed in their hands than in the hands of the Professor of Divinity?—It would be difficult to give an answer which would be applicable to every case, to such a general question; but, in Glasgow, the management is in the hands of the students, and it has never been found fault with; and I am not aware that any improper books have ever been brought into the Library there.

Do you think any improper books get access to the Library here?—I do not mean to insinuate that; but I mean to say, that students of Divinity are proved, in the instance referred to, to be very efficient curators. I certainly would give my opinion, however, that no harm could result from allowing the Professor a *veto* in the selection and purchase of books.

In regard to the Theological Library at this University, were the accounts of the Librarian submitted to the students?—No; that, I recollect, was a subject of great complaint.

Was it done at any former period?—I cannot speak positively as to that.

Is there anything else you think material to mention on this point?—I remember that, in the letter which I mentioned was sent to me by Dr. Ritchie, he stated that he wrote to me personally, because he did not wish to recognise us as a Committee. At the same time, he gave me to understand, that he wished the information in the letter to be communicated to

University of Edinburgh.

Rev. M. Leishman.

29 May 1827.

the students. Next year there was another meeting to renew the proceedings. I, for my part, thought it better to leave the matter to Dr. Ritchie for some time longer. This was accordingly done; but, after considerable delay, when Dr. Ritchie appeared to be taking no farther steps in the business, other meetings took place, when, on communicating with him, we discovered he had forgotten he had given such a letter as that which I have spoken of. However, in the course of a few days, he sent to me another letter, which was even more satisfactory than the preceding one, as to the recognition of the claims of the students. This letter was likewise sent to me for the purpose of being communicated.

Do you think it would be of advantage to the Library, if it were more assimilated to the Glasgow mode than at present?—I think it would. Students of Divinity have their characters in a considerable degree formed—the greater number of them have reached the age of manhood—and, considering their previous attainments, and as they themselves are to reap the benefit of the Library, I can scarcely imagine they would not manage it in a proper way; and what I found my opinion greatly upon, is the fact that the Theological Library at Glasgow is satisfactorily managed by the students of Divinity there. I happen to be a *civis* of that Library, and, in that way, know something of the management there.

What is the nature of that *civisship* of the Glasgow Library?—A student of Divinity, who has paid a certain annual charge for the support of the Library for a certain number of years, acquires that right, and is in virtue of it entitled, all the days of his life, to obtain books from the Library.

There is no additional charge?—None.

And what number of books are so obtained?—Three volumes in winter, and six in summer.

And to what distance may books be conveyed?—I believe there is no limitation in that respect.

Do you know whether, under that system, many books have been lost?—I never heard.

Is it not possible that the use of books by Ministers residing at a distance, may prevent students from enjoying full access to them during session?—They are allowed to have books out only during a limited time, and there is a fine exacted for every week the books are kept beyond the period that is fixed by the Regulations. I have paid the fine myself; and I believe, in point of fact, many ministers at a distance from Glasgow do not use the Library. It is a very large Library.

You do not mean to say it is as large as the Divinity Hall Library of Edinburgh?—I should think it is nearly so, including Leechman's Donation. One of the things we found fault with here I now remember, in addition to what I have already mentioned, was, that there was no printed Catalogue.

Was there none? Had you no access to a printed Catalogue?—There was a printed Catalogue certainly in the Library, but it was old, and consequently very defective; and therefore we considered it absolutely necessary to have a new and more perfect one.

[*The Witness, on going to Glasgow, applied to a late Secretary of the Divinity Hall Library of Glasgow for particular information in regard to that Library, and the following Letter is the answer received to that application:*]

"*Gorbals, 11th June* 1827.

"Dear Sir,—I have much pleasure in complying with your request to furnish you with an account of the state and management of the Divinity Hall Library in the University of Glasgow, convinced that it requires only to be known, to be held up as a model for the direction of the superintendence of the Libraries connected with the Divinity Halls of the other Universities of Scotland.

"That I might not trust entirely to memory in furnishing you with the following account, I applied to the present Secretary of the Committee of Management, who has kindly allowed me the inspection and perusal of all the documents and records of their proceedings, from the commencement of their Institution down to this time.

"This private collection of books was commenced in the month of October 1744, under the auspices of Principal Leechman, then Professor of Theology in this University, by voluntary contributions from the students of Divinity. The amount of these for a number of years—as may be seen from the accompanying document of the funds collected in each year, so far as they have been preserved—was very trifling, it being left to each student's own discretion whether, or how much he should subscribe. In the year 1778, the entry-money for each student was fixed at 2*s.*; in 1784, it was raised to 3*s.*; in 1786, to 4*s.*; in 1789, it was reduced to 3*s.*; at which it continued till the year 1805, when it was raised to 7*s.*; at which amount it still continues. Some difficulty having been often experienced in enforcing the payment of this entry-money from each student, the Faculty of the College, on the 3d May 1813, on the matter being represented to them, resolved, 'That the Professor of Theology should not enrol any person as a student of Divinity, until he has produced his Library ticket.' Every student of Divinity who pays this entry-money for six years, becomes a *civis* of the Library, and is entitled ever after to read out of the Library without any additional charge.

Vide App. p. 519.

Faculty Minutes.

"The Library is under the immediate direction of a Committee of the Students of Divinity, not exceeding twelve, who are annually chosen on the first Monday of December by the students themselves, with the approbation of the Professor. Four of the former Committee must always be re-elected, and the other eight from the remainder of the students, not excluding the former members of Committee. At the same time, a Librarian is likewise chosen annually by the students of Divinity and *Cives of the Library*, who is *ex officio* a member of Committee. The Committee elect one of their own number to act as Secretary and Treasurer for the year. He is required to write out a minute of the proceedings of each meeting of Committee, to call all meetings by the order of the President, to take charge of the funds, to lay out the money in books, to keep a superintendence over the Librarian, to report what books require to be replaced or bound, and to be in all cases the organ of communication with, or from the Committee. His office is quite gratuitous.

"The Librarian, since the year 1810, has always received from the Faculty a bursary on Hastie's Foundation of £15; he likewise is paid out of the funds of the Library £6 per annum. During the session, the Library is open every lawful day from 1 to 2 o'clock, Saturdays and holidays excepted; and during the vacation, it is open from 12 to 1 o'clock on Wednesdays and Fridays, the month of

University of Edinburgh.

Rev. M. Leishman.

29 May 1827.

July excepted. Books in octavo *et infra* require to be returned in two weeks, quartos in four weeks, and folios in six weeks, during the session; double time being allowed during the vacation. There are penalties which are exacted for the transgression of this rule. Each reader is entitled to two volumes, and one from Leechman's Donation, at one time, during the session, and to double that number during the vacation. There are at present 260 *Cives* and students who use the Library. In summer, the number of volumes out in circulation is about 1040; in winter, about 500. The books are often taken out to great distances, especially in summer; but no books are allowed to be taken to Ireland or England, without a letter of guarantee being given by a person resident near Glasgow of their safe return. Little or no inconvenience is felt by the students, during the time of session, from this privilege, as the Librarian never *then* allows those books which are most in demand by them to be taken out of Glasgow. From the attention which the Committee pay to the enforcing of the Regulations of the Library, there are very few instances of students losing books; and whenever there have been any, they have always been compelled to replace them, or to pay a sum of money equivalent to their value. To secure the Library more against books being carried off, the Professor of Divinity never gives a certificate of attendance to any student, until he is satisfied that all the claims which the Library may have against him have been discharged.

Catalogue on Table of Commission.

"After the election of the new Committee, the old Librarian gives in a written statement, whether duplicates require to be got of any books which during the past year have been in great demand. The Committee decide whether these should be procured. The Committee are the sole judges of what books should be purchased. No new book can be voted into the Library at the same meeting of Committee at which it was proposed, but must be postponed to the next regular meeting of Committee, to enable every member to ascertain the propriety of its admission. From the accompanying Catalogue of the Library, you will at once perceive, that, without entering into any invidious comparison with the Libraries of the other Divinity Halls, or their management, that during the long period of eighty-two years, there has not been an improper book admitted into the Library. Instead of depending on the judgment of one person, whose reading, even though extensive, must be necessarily circumscribed, the Theological students of Glasgow have, as a guarantee against the admission of improper books, the matured opinions of thirteen persons elected by themselves, whose talents and abilities they are well acquainted with, and who are conscious that they are acting under the eye of their fellow-students, and are responsible for their conduct. If any of the members of the Library find fault with the conduct of the Committee, either with regard to the purchase of books, or their attention to the interests of the Library, or considers himself aggrieved by their decisions, he is enabled to bring their conduct under the review of the whole *Cives* and students of the Hall, whose decision is binding on the Committee, and who can turn them out of office, and subject them to severe fines. That the whole *Cives* and students (or, as they are called, *the Hall*) may be easily called together, they have a President and a Secretary distinct from the President and Secretary of the Committee. The Committee are not entitled to make any new regulations with regard to the Library, nor to alter the former ones. This power is vested only in the Hall.

"All the books which have been given out from the Library, must be returned on or before the Wednesday preceding the election of the new Committee; if not returned on that day, a fine of 2*s.* 6*d.* is exacted for each volume. The Committee then proceed and examine strictly the whole Library, to ascertain whether there have been any books lost during the year; and the new Committee, previous to the Library being opened, make another strict examination of the Library. If all the books be found in, or satisfactorily accounted for, then they give the old Committee a discharge, relieving them of all responsibility with regard to the Library.

"At the end of the year, the accounts of the Secretary are audited by the Committee, and a copy of the balance-sheet posted up in the Library, for the inspection of all concerned.

"The number of volumes now belonging to the Library, including Leechman's Donation, is about 4,400. Every student has a printed Catalogue of the Library. The names of all the new books, as soon as purchased, are posted up in a conspicuous place in the Library, until they amount to a sufficient number to have a new Catalogue, or an appendix to the old one printed. Whenever there has been a new Catalogue printed, the expense of it has been defrayed by voluntary subscription among the *Cives* and students; and the amount of money obtained from the sale of copies given to the funds of the Library. The amount of expense incurred annually, in managing the Library, including the Librarian's salary of £6, fires in the room, &c., does not exceed £9.

"The Professor of Theology has no control whatever over the Library, its funds or management, except that he presides annually over the meeting of the students when the Committee is elected, and expresses his approbation of their choice. From courtesy, the Committee always request the Professor to recommend, each year, some work of merit to the Library, which they purchase. Were you to ask me, whether, from the experience I have had in the management of this Library, it would be for its advantage to allow the Professor of Theology to have more to say in its direction? I would at once frankly answer, it would not. There is, and has always been, a pleasing intercourse maintained, since the foundation of the Library, between the Committee and the Professor, which, in any other circumstances, could not be maintained. For the long period of eighty years, I have not observed, in any of the minutes of Committee, the least approach to wrangling or bad blood with their Professor; but, on the contrary, numerous are the times when they have delighted, in any difficulty, to meet with him, and to deliberate for the good of the Library. His opinion they have always respected; and never, or very seldom, have they had cause to differ from it.

"It is not, however, upon theory, or even the result of my own experience, that I would have you to rely. The management of this very Library furnishes a striking fact in corroboration that its interests will always be better attended to by a Committee of Students, than by any Professor, or class of Professors.

Faculty Minutes.

"On the 9th of December 1782, Principal Leechman, the Founder of this Library, when in his 76th year, 'Intimated to the Faculty that he intended to give a present of Theological books to the College, for the use of students of Divinity; and begged the meeting to accept of them, and put them under the care of a Librarian, to be lent out to the students of Divinity under such regulations as a Committee of the eldest students of Divinity, with the consent of the Professor of Divinity, should draw up.' The number of volumes in this valuable donation was about 320. Three years afterwards, as the last mark of his affection to the students of Divinity, while on his death-bed, he gave to the same collection an interleaved quarto Bible, with manuscript notes in his own hand-writing, consisting of some short observations of his own, and many references to the chapters and pages of the books he had given to the Library, for the illustration of the most difficult passages of the Old and New Testament.

Committee Minutes.

"From some arrangement which was entered into between the Faculty and the Magistrates and Town-Council of Glasgow, with regard to the University Library, the Town-Council became the electors of the Librarian of Leechman's Donation; and the control and management of the Donation was vested in the Theological Professors. The Committee of the Divinity Hall had no voice whatever in the management or direction of the Librarian. The consequence was, the books gradually disappeared. That constant and wholesome check which their own Librarian had, was not experienced by Leechman's Librarian. Though his Library-book was examined at the end of his period of office, yet no steps ever were taken by the Faculty for the recovery of the outstanding books. Every Librarian, on an average, lost twenty volumes. At last the evil became so glaring, that the students were obliged to interfere: if they had not done so, in a few years the skeleton only of this very valuable donation would have remained. The Committee took up the case; and at a meeting with the Professors of Theology and Church History on the 29th April 1820, 'It was *unanimously* agreed that the management of Leechman's Donation should be under the superintendence of the Committee of the Divinity Hall Library, and in every respect as the books belonging to the students of Divinity.' This agreement was confirmed by the Hall. The Town-Council still elect the Librarian, who draws the salary, but has no charge of the books. The good effects of this arrangement have already become evident. Books which had been out of the Donation for twelve years have been recovered; and continued exertions are using by the Committee to complete the defective copies, and to restore this Donation to that valuable condition in which it was bequeathed to the students of Divinity.

"Thus have I endeavoured to trace the History of the Divinity Hall Library of Glasgow. Of the good effects which the management of this Library have caused to result to the students, I need not dwell upon. It is one of the most powerful auxiliaries which any Professor can have to the instruction of his pupils; nor, I am convinced, can there be found a single individual who has witnessed its operations, even though he have felt the effects of the strictness with which its regulations are enforced, who, in the retrospect, will not be found to rejoice in being permitted to add his testimony of approbation to its management, and to the advantages he has derived from it.

"I have only further to express my regret, that the amount of the funds of the Library is so limited. I know no method in which the best interests of man could be more benefited, than in furnishing those who are soon to go forth as the guardians of his religious interests with facilities by which he may be enabled to attack, with their own weapons, the sceptic or the infidel, and to defend the bulwarks of Zion against all her enemies.—I remain, Dear Sir, Your obedient humble servant,

(Signed) "James M'Lean, Jun."

"*To Rev. Matthew Leishman, Govan.*"

APPENDIX.

Statement of the Amount of Money collected for the Divinity Hall Library.

Sessions 1744—1745	£9	3	0
,, 1745—1746	4	15	0
,, 1746—1747	6	12	6
,, 1747—1748	6	4	6
,, 1748—1749	8	12	6
,, 1749—1750	6	18	0
,, 1750—1751	5	16	0
,, 1751—1752 no collection.			
,, 1752—1753	4	15	6
,, 1753—1754 no collection.			

In the three following Sessions the collections were given to the Quæstor, for the use of the University Library, as the students had not contributed when in the Philosophical Classes.

1757—1758, retained from the collection for the University Library	£1	17	6
1758—1759, no collection, the Professor being indisposed at the usual time of collecting.			
1759—1760, collection given to the University Library.			
Sessions 1760—1761 {Retained half of Collection.}	2	0	0
,, 1761—1762	5	1	6
,, 1762—1763	4	12	6
,, 1763—1764	5	15	6
,, 1764—1765	4	7	9
,, 1765—1766	5	10	0

University of Edinburgh.

The Reverend *George Hamilton*, Kirkcudbright, called in and examined.

Rev. G. Hamilton.

29 May 1827.

You studied Divinity here under Dr. Ritchie?—I did in the years 1813-14-15-16, and 17.

Was your attention much directed to the Theological Library while you were a student here?—It was.

Have the goodness to give the Commission any information you have regarding its constitution?—I do not know any thing particular about its constitution, farther than that a catalogue was found, which led us (the students) to suppose we had a right to some management, and to look after the funds.

Were there no more ancient documents to which you had access?—Nothing of that kind had we access to, except this catalogue.

Was there a great deal of dissatisfaction then with the administration?—There was. One of the complaints was, that we were not allowed to have any management at all, or knowledge of the funds laid out.

Was it the object of the students to obtain complete management then?—Our object was to obtain that; but we would have been glad to have got any thing at all.

It was not the practice then to submit to the students the accounts of expenditure?—No, it was not.

That was one of your grounds of complaint?—Yes.

And one was, that you were not consulted at all as to the choice of books?—It was.

Was it the practice to give to the students an account of books purchased in any one year?—No; we had nothing to do with the management of the Library at all.

Was there an impression then, that many books were purchased, which did not come to the Library?—We thought that there ought to have been many purchased by the funds, but few came to the Library.

Was there any annual examination at the sight of the students?—Nothing farther than an examination by the Librarian.

By whom was he appointed?—By the Professor of Divinity.

Did you make any remonstrances to the Professor, on the subject of the Library?—We did.

What was the nature of them?—The students met, and appointed, I believe, twelve of our number a Committee, to carry on a correspondence with the Professor; and we had meetings with the Professor, and wrote to him; and he replied to our letters—not addressing them to us as a Committee, but as individuals.

Was the arrangement about the Theological Faculty entered into at the time you were a student?—No; it was after. I think it was when I gave irregular attendance at the Hall.

Did you conceive that the claims of the students rested chiefly on their idea that they had a right of management?—Yes.

Do you happen to know anything of the Theological Library at Glasgow?—No; I never studied there.

Is it still your opinion, that it would be better the students should have the choice of books for the Library, than that it should be lodged with the Professor?—I do not think the students are exactly those who should have the choice themselves. I think it would be better that the Professor should have some control—but that they should have the right of suggesting.

Were you not allowed to suggest books in your time?—I am not aware of a single student having done so at that time.

Were you well or ill supplied with books then?—But indifferently. We had the older books, but not the new ones.

The students complained likewise of the want of a printed catalogue?—We did.

You must have seen printed catalogues of the Library?—There were imperfect ones, and there was one fully written out, which came into our hands, but which, we thought, should have been published long before.

Are you aware that books were ever sent to the Library, which the students thought unworthy of admission?—No; nothing of that kind fell under my observation.

No other information occurs to you to communicate?—No; I am not aware of any thing I can communicate in regard to it. I think the funds of the Library ought to be accounted for some way or other.

Do you happen to know any thing as to the administration at present under the Theological Faculty?—No.

The Rev. *Thomas Brown*, Minister of St. John's Church, Glasgow, called in and examined.

Rev. T. Brown.

At what time did you study Theology here?—In 1795 my Curriculum as a student in the College commenced. It was in the year 1800, and during Dr. Hunter's time, that my Theological studies commenced in Edinburgh. In 1802, I came to Dr. Hunter's family as tutor.

Was your attention much directed to the state of the Theological Library?—I was Librarian for some years.

Were there any complaints of students then?—None.

How long were you Librarian?—I think about four years.

Was Dr. Hunter in the practice of communicating accounts of the expenditure to the students?—I made up the accounts, and he audited them. He announced this in the Hall, that, if any wished, they might see them.

They had access to see them?—Yes.

Did the students suggest books to the Professor, to be purchased for the Library?—They did.

5 b3

University of Edinburgh.

Rev. Thos. Brown.

29 May 1827.

And did he pay attention to them?—Yes, he did.

Were the books he purchased carried to the Library soon after they were purchased?—Yes. The Doctor inspected them often himself, if they were works which he had not seen; after which, they were carried to the Library.

Do you happen to know anything about the original constitution of that Library?—No.

Were his accounts regularly examined and approved of by the students?—I do not know. They had it in their power to examine them. I kept the accounts till the Doctor audited them; and he announced in the Hall to the students, that this had been done, in case any wished to see them.

Were there no complaints among the students, as to the mode of giving out books?—No, I cannot say there were; at least I never heard of any complaints.

Is it your opinion, that it would be advisable that the students should have the choosing of books for the Library without control?—Not without control. I do think, that while the students enjoy the privilege of suggesting the names of books, the choice of books should be under the direction of the Theological Faculty.

Do you happen to know the present arrangement as to the Library?—I have been little in Edinburgh for the last 20 years, so that I know very little how the Library is managed.

Do you think the plan of managing the Divinity Hall Library of Glasgow, preferable to what prevailed at Edinburgh, when you were Librarian?—I must say, from my connexion with the Library here, and knowing how faithfully the business of the Library was conducted, and that the students had the power to suggest books, I should be as well satisfied with what was the plan followed here. Dr. Hunter, on every occasion, received suggestions from students as to the purchase of books.

Have you seen the catalogue of the Divinity Hall Library of Glasgow?—Not since I went to Glasgow as Minister of St. John's Church.

You cannot speak to the collection of books here now?—No; there has been such a lapse of time since I was Librarian.

Do you think the students, while you were Librarian, ever applied to see the accounts?—I do not think they did; but I had no access to know.

Were the accounts not in your hands?—Yes, till they were audited; then Dr. Hunter kept them.

Did not he make an intimation from the Chair as to the accounts?—Yes, that he had examined them—that they were audited. As far as my recollection goes, Dr. Hunter always made that intimation.

And did he invite the students to examine them; you said it was open to them to inspect the accounts?—As I had nearly finished the prescribed term of study before I entered Dr. Hunter's family, my attendance was not very regular; yet I was often in the Hall, and my impression is, indeed I have no doubt, that the Doctor regularly intimated to the students that the accounts were open for their inspection, if they thought proper. The book of accounts, I know, was carried to the Hall for this purpose—although, I believe, few, if any, inspected the accounts, being satisfied that the funds were faithfully applied.

Who was Librarian before you?—Mr. James Thomson, one of the Ministers of Dundee; and Mr. Ramsay, Minister of Ormiston, was joined with me—but he had not access to the accounts during my time. He was a mere assistant as to the books.

Who succeeded you as Librarian?—I left Mr. Ramsay and Mr. Wightman, now in England.

Did you ever see the Donation-book?—No.

Did you happen to know where it was at the time you were a student?—I knew nothing of it at all.

Do you remember of any manuscripts in the Library?—My attention was not much turned to that. It was supposed there were, or might be some in the lower part of the Library; but that was very seldom opened.

Was the state of the books annually ascertained then?—No, I do not think it was.

Were the books called in at any particular time, so as to enable you to know if any books were amissing?—We found, from our books, who were delinquents—who kept them too long; and the Librarians wrote or spoke to such.

Were books lent to persons not students of Divinity?—I think to none but clergymen or preachers.

There were no such *Cives* at that time, as you may see noticed in that Regulation?—[*The Regulation of* 1757 *was handed to Mr. Brown.*]—No, not as far as my recollection goes. If there were *Cives*, I do not remember if they availed themselves of their privilege. The claim made in my time, on students, for the benefit of the Library, was 5*s.* each.

Have you any further remarks to offer?—During my Librarianship, there were several volumes missing, some of which we recovered; but others, from the death of students, or non-acquaintance with their place of residence, we could not with all our efforts regain.

The Reverend *Andrew Bullock*, Tulliallan, called in and examined.

Rev. A. Bullock.

You were a student of Theology at this University?—Yes.

Under what Professor of Divinity did you study?—Dr. Ritchie.

Was your attention much directed to the Theological Library when you were a student?—Yes, from being Librarian four years.

In what years?—From the end of 1810 to the end of 1814.

During that time, were there many complaints among the students, in relation to the Library?—A great many.

What was the nature of them?—They arose, in a good measure, from students not getting

University of Edinburgh.

Rev. A. Bullock.

29 May 1827.

access to the books,—but chiefly from uncertainty as to the money that was received being all expended.

What was their complaint as to the access; was it that they had not sufficient access?—Their complaint arose from the Library not being so available as it might have been. The room was too small, and very incommodious. Many of the books were arranged in double, and even triple rows upon the shelves, and were thus out of sight; and the Librarians, from never continuing in office more than four years at the utmost, and some of them only one or two, could not have that accurate and ready knowledge of the places of the books, and the details of the Library, which longer service would have taught them. There was, besides, a number of books out, nobody knew where. I well recollect I was a month or two, searching and inquiring, before I could get hold of the fifth volume of Walton's Polyglot —the most valuable volume, as it contains the New Testament. It had been given out, without being marked to the person who got it. And lastly, there was no proper catalogue in the hands of the students, so that they could not know what books the Library actually contained. But the chief ground of complaint was this, that they did not know how much of the money received was expended.

No accounts, then, were submitted to the students?—Neither to the students, whose right in the matter might be questioned, nor to the curators, to whom Dr. Ritchie had made a promise to that effect, as I believe their minutes bear; and this occasioned our chief difficulty, on the day of the annual election of curators, when a general meeting of the Hall was held, after public intimation. Dr. Ritchie having promised to show to the curators, and to me as Librarian, an account of the money received and expended, we thought, of course, he had it all marked down—we had no reason to think otherwise; and, trusting that this was the case, we promised to the students, upon the faith of his doing as he had said, that we would lay before them a satisfactory statement of the affairs of the Library on or before the next election day) as we were bound to do by the existing Regulations); and thus we allayed many of the discontents, and got the new curators chosen. What difficulties the curators and Librarians had on these occasions, standing as we did between the Professor and the students, and how matters had to be managed, will best appear from the following letter which Dr. Ritchie wrote to me on the morning of the last election day:—

"Dear Sir,—I have now fixed to-morrow for the election of curators; and have resolved that the election shall be made within the hour from 11 to 12, with the view of making students understand, that it is a business committed to them only as students under my charge. I shall give a very short lecture, and shall leave the Hall twenty minutes before 12, with a recommendation to the students to take care that they lose no time in idle altercation about things with which they have nothing to do. Will you be so good as give notice of this my resolution to Mr. Nicol, to the other curators, and to the friends whom you may wish to attend.—I am, Dear Sir, your, &c.

"*Argyle Square, Wednesday, 18th March* 1812. William Ritchie."

On that, and on the other occasion, we got through with the election, and escaped a vote of censure only by promising a production of the accounts.

But it was not done?—Never.

Did the students found on any *right* as to the Library, or proceed on notions of expediency?—Their claim was founded, in a great measure, on regulations which Dr. Ritchie issued the first year I was Librarian; but some of them founded their claims on other grounds.

Did they claim to have had any right, originally, in the administration of the Library?—Yes. Great stress was laid on the statement in the Donation-book, that the Divinity students had raised a sum of money to assist in founding the Library, on the title-page of an old catalogue, and on the mention of curators in the regulations prefixed to that catalogue. There were, in fact, two questions, which those who took the most active part in these discussions endeavoured to keep separate. There was the question of absolute right to manage the Library, as if it were the property of the students, which the more intelligent always waived; and there was the question of right to manage it along with the Professor, and seeing the books were purchased, and at what time sent in, and that the existing regulations were enforced. In so far as I could judge at the time, or can recollect now, it was on views of expediency that the majority of the students proceeded, or at least those of them who possessed most talents, and had most influence.

You mentioned that Dr. Ritchie had appointed curators to the Library. In what manner were they appointed?—Dr. Ritchie, the first year of his Professorship, was desirous of being popular; and, as there had been discontents in Dr. Hunter's time, he referred to these; and with the view of removing the ground of them, proposed that there should be curators; that for this purpose, there should be given in to him a *leet* of six or eight persons to be chosen by the students at a general meeting of the Hall; and that he should select from this *leet* a certain number—four, I think. But when the *leet* was given in to him, he said he was so much satisfied with the names, and had such confidence in the electors, that he would keep the whole in.

And did they continue for any length of time to exercise their powers?—They continued in 1809-1810, Dr. Ritchie's first year, and during the first and second year of my Librarianship.

What was the cause of their ceasing to act?—I have reason to believe it was in this way: There was to have been a new catalogue made out, which was much needed, with a constitution and regulations prefixed to it. I was appointed to make out the draft of a constitution for the Library, and so was Mr. Nicol; and the Professor and curators were to say which should be adopted. But then a natural question occurred, which led to an end of the curatorial system. The curators wished to have their powers defined, and for this purpose, a deputation of them went to Dr. Ritchie, Mr. Walter Nicol, now Teacher of Mathematics in

5165

University of Edinburgh.

Rev. A. Bullock.

29 May 1827.

Edinburgh, and Mr. Samuel Richardson, now Minister of Penningham. A conference was held, and there was some little difference of opinion. They were dissatisfied with Dr. Ritchie, and he was dissatisfied with them. Mr. Nicol, who is now in Edinburgh, knows more about the matter than I do, as I was not present. He was secretary to the curators. That was the last year of the curators acting.

While curators were in existence, under that system, did they suggest books to be bought, to Dr. Ritchie, or did they receive suggestions from students?—That was one of the causes of complaint. The curators gave in lists to Dr. Ritchie, but he did not purchase the books they pointed out. In making out these lists, the curators were not assisted or guided by suggestions from the students.

Was there an impression at that time, that many books purchased did not come to the Library?—Yes, that was believed to be the case.

At that time, was any annual review of the state of the Library made?—What was done by the curators, when first elected in 1809, was this: They made a thorough examination into the existing state of the Library, which cost them much time and trouble. By examining the shelves and the Librarian's ledgers, they ascertained what sets were incomplete, and what books were altogether lost, and who the persons were who had books marked against them, which they had failed to return. They drew up a report on the subject, with a list of the books amissing, and of those persons against whom the Library had claims; and this list was of great use to the Librarians, and to succeeding curators.

But that was not done during your time?—Not to the same extent, because it was unnecessary so soon after the labours of our predecessors. Our object was twofold—to recover as many of the books as possible from those against whose names they were standing, in which we were very successful—and to prevent any more from straying; and, for this latter purpose, there was a calling in of all the books towards the end of every session, and before the students had dispersed. And on such occasions, the Curators used to inspect the pages of the ledger in which the students' names were written, to discover who those were who had not returned the books marked against them.

Do you think the system of the Library might be much improved?—One great improvement would be, an annual auditing of the accounts. If Dr. Ritchie had acted on the principle of showing the accounts of the money got in, and the money expended, and that all had gone for books—though these had not been those pointed out by the Curators, there would have been fewer complaints.

Did Dr. Ritchie's predecessor do that?—We knew that he did; and that was one of the complaints against Dr. Ritchie, that he would not do what Dr. Hunter did.

How did it appear that Dr. Hunter did that?—We heard there was every year an auditing of the accounts.

By whom did you understand the accounts to have been audited; was it by the students?—No, but by the Professor and the Librarians, who, at the end of the session, gave to the Hall, by way of information, a statement of their intromissions with the funds. The impression was, that Dr. Hunter's acccounts were quite correct; and we were told that, in addition to the statement, a book was kept, in which all the money he received was marked, and that this, and a list of the books purchased, lay in a drawer, to which the students had access.

Was there any complaint as to the kind of books purchased?—Yes; one, in particular, was decidedly objected to, as a book not fitted for our funds, and which ought to have been got cheaper—the Abridgment of the Royal Society's Transactions by Hutton.

Do you know what price was paid for it?—No; but that Dr. Ritchie proposed to get it soon after it was published—that it was purchased—and that afterwards the price fell, which occasioned grumbling.

You do not remember any other books you thought unfit for the Library, or too expensive?—No. Dr. Ritchie bought many most useful books, not pointed out to him, which gave great satisfaction.

What was the nature of those he purchased; were they books of Theology or Biblical Criticism?—He purchased some English works—works of living authors—good books, and in great request. He ordered in Hale's Chronology—a dear book, but quite fit for the Library, being valuable for consulting—and Wetstein's Testament, which it was a shame for a Theological Library to have wanted so long. Some of the students objected to him, that he had not more of the common books, but that he bought the more rare works of Criticism.

Did he purchase many foreign books of Theology?—I do not exactly remember, it is so very long ago, and I never saw the booksellers' accounts—I never paid any. The Library being pretty well supplied with foreign Theological works, not quite modern, before Dr. Ritchie's time, it was not necessary for him to add to it many books of that kind. The books which he did send in were all of them, in so far as I can remember, books which I should be sorry to see the Library without, with the exception of Hutton's Abridgment. I thought so at the time, and I think so still. He bought no trifling books.

Do you think it likely the students of Divinity, if they had had the selection, would have purchased foreign books, useful, you think, to the Library?—The Curators gave in a list, and it was a judicious list of useful books. But if the whole Hall had been allowed to give in lists, and those to have been adopted as far as the funds permitted, I am quite sure that many of the books thus added to the Library would not have been so useful.

Do you conceive then it would be of advantage that the choice should lie with the students, or that that should be under some control?—We at the time would, with great pleasure, have given the Professor a negative, if that would have satisfied him.

You still think he ought to have a negative?—Yes, I think this absolutely necessary for the welfare of the Library, to prevent its being filled with trash, or with an undue proportion of

University of Edinburgh.

Rev. A. Bullock.

29 May 1827.

Sermons, or with duplicates and triplicates of books which every student ought to have; but the students might have the liberty of suggesting books to the Professor, and they ought to see the annual accounts. Had the Professor shown the students how all the money got in went out, and that a great proportion of the books purchased were useful, there would have been no grumbling. One of the plans proposed at that time was, that every student who wished a particular work to be purchased for the Library, should enter it in a book to be kept for the purpose, that thus such as had a knowledge of Literature, might have an opportunity of suggesting books. From my experience as Librarian, and almost daily intercourse with the Divinity students for six or seven years, I am warranted in saying that I can see no danger in the Professor exercising the sole power of selecting the books, and no risk of complaints from the students on that subject, if a few improvements were introduced into the administration of the Library—if what I have mentioned about the accounts were adopted—if the great proportion of the new books were sent in within a reasonable time—and if the regulations for the time being were fairly complied with. But when these are flagrantly and repeatedly violated, and when the books purchased for the Library accumulate in hundreds of volumes, and for years, in the study of the Professor, it is no wonder that the students complain and hold meetings. And when they have begun to do this, I know there is great risk of their going farther than they at first intended, and farther than is prudent, and agitating questions about their rights which they would otherwise never have thought of.

Do you know anything of the present system of management?—Ever since I left Edinburgh, I never heard but generally of the students complaining.

Do you know the system at Glasgow?—I know only this, that they have much more power there than we had here when I was a student. I believe Dr. Ritchie blamed the Glasgow students who came to study here, for endeavouring to introduce that system here.

You would have been satisfied with a less share of management than they enjoy there?—I should have thought so. An annual re-election of Curators would have been desirable. I was Librarian, and Dr. Ritchie sometimes consulted me. But I found it difficult to satisfy the students, as neither the Curators nor I could say to them we had seen the accounts.

When you were Librarian, what times was the Library open to students?—Two days in the week in the winter, and one day in summer.

And for what length of time?—Only an hour at a time by the regulations, but almost two hours, in point of fact.

In what manner were the books given out; was any account of books given out taken?—Every *Civis* had a page in the ledger, and in it the book given out and the date were marked. We looked sharp after the time, that the books might circulate as much as possible among the students, whose numbers were every year increasing; and when a book was returned, we crossed it.

There was no counter-entry on the return of a book?—No.

Is the Librarian in no degree paid out of the funds of the Library?—My salary arose from an £8. 6*s*. 8*d*. bursary. My colleague got the same. The first year of our entering on office our work was increased, and there was a proposal to raise the salary, and that an additional £6 should be paid to each of us by the Professor, out of the enrolment-money of the students, who were consulted at a meeting of the Hall, and agreed to the proposal.

Do you not think, that if the students had obtained the whole management, it would have been but reasonable they should have paid the Librarian?—Certainly, and they considered that they were doing so at the time, to a certain extent. The majority of them were willing to raise the subscription-money to a guinea, that so more books might be bought, the Librarians' salaries raised, and the Library be open every day in the week.

Were the students satisfied with the supply of books?—The number of students augmented, and there was some difficulty as to that, which was increased by the long detention of many of the books by Dr. Ritchie, after they had been sent in to him by the booksellers. Duplicates, and I think even triplicates, of some books much in demand were necessary; but that bore hard upon the funds, and it was a very nice question how far it was right to go in gratifying the students in this respect.

Have you any suggestions as to the administration of the Library to make?—I would decidedly recommend the having one Librarian with a larger salary, and having the Library open every day of the week, with accommodation for consulting the books on some of the days, that the students might have opportunities of inspecting and making extracts from the larger and more expensive works, which would not be given out. The Librarian's continuance in office should not be limited by his four years' attendance on the Divinity Hall. This makes him retire at the time when he is most effective, and almost as soon as he has become acquainted with the pages of his Catalogue, and the divisions of the Library, and has begun to feel interested in its prosperity. A system of management, which answered well enough forty or fifty years ago, will not do now, when so large additions have been made to the number both of books and of readers. Besides, the frequent change of Librarians is positively injurious to the Library; it facilitates dilapidations, and introduces confusion; books are lost, or they are mislaid. I would also most earnestly suggest, that a Catalogue of the books in the Divinity Hall Library be compiled with all prudent dispatch. The Library, as it is, is in a great degree inaccessible to the students. They have no proper Catalogue, and do not know what books to ask for, for they do not know what books the Library contains. The only Catalogue, of which a very few copies are in the hands of the students, was printed about forty years ago, and is therefore of little use. In my time, each of the Librarians had an interleaved Catalogue, with all the new books inserted. There is now only one, the other having disappeared some years ago, and it would be unsafe to part with that remaining one, however short, or to lend it to any person; for if it were lost or mislaid, there would be great confusion. The person em-

567

Rev. A. Bullock.

29 May 1827.

ployed in compiling the new Catalogue should, if possible, be a Librarian. He will do the work sooner and better than any other person, and will, from having done it, become more valuable and effective as a Librarian. The Catalogue should be put to the press as soon as it is made out, so that the same person that completed it may superintend the printing. I made out a Catalogue in 1812, at the request of Dr. Ritchie, with whom it has lain ever since; but as it would not be very easy for another person to correct the press, if it should be printed, and as its value is much dimished, from the additions since made to the Library, I think it would be greatly preferable to have an entirely new Catalogue made out. As the printing of the new Catalogue will be attended with considerable expense, and as it will be of substantial advantage to the students, I think that, though they are all, in so far as I can learn, very anxious to have it, the purchasing of it should not be optional, but that each student, at his first enrolment after it is published, should pay for a copy of it. In this way it would soon pay itself. No book should, on any occasion, be given out to any person, whether Professor or student, without being marked down by the Librarian. I know, from good authority, that when the Library of one of the Professors in the University, who died a good many years ago, was sold by auction, a number of books, with the mark of the Upper and General Library on the title-page, were sold along with the others. This could not have happened, if these books had been marked down to him by the Librarian. Dr. Ritchie, though I had been willing, would never allow me to give him a single volume without marking it on his page in the Ledger. There should be only *one* key to the Library, and that kept by the Librarian. This is but fair to *him*, the responsible person; and I consider it *absolutely necessary*, to prevent dilapidations and misplacings. The present Professor paid two or three visits to the Library when I was in office; but I recollect perfectly, that he would not set a foot within it, unless accompanied by the Librarian. As to the general superintendence of the Library, I am quite convinced, both from experience and observation, that it is not the Theological Faculty, but the Professor of Divinity, who should be intrusted with it. From his office, he has more intercourse with the students, and knows more of their character and habits, and is, therefore, more likely to make a fit selection of books for them, than any of the members of that learned body. The Janitor to the Divinity Hall, who also keeps the door of the Hebrew and Church History classes, has, after deducting his outlay for coals, &c., an income of nearly £60 for about four months and a half's attendance. A person fit to act as door-keeper to the three classes, could easily be procured for a much less sum; and the difference might be added to the funds of the Library. I have only one other suggestion to offer as to the Divinity Hall Library, and it is this,—that students of Divinity, on becoming preachers, should not be excluded from the benefit of the Library, but should be allowed it, on their paying a small sum annually. It is when they have become Preachers, that they most need books. It is then that they have important public appearances to make, for which they must carefully prepare. Many of them have but scanty incomes. They cannot get books from the Upper or General Library, unless they attend a class in the University, which may not be necessary, or not convenient; and to withdraw from them as preachers those facilities for accomplishing themselves in the literature of their profession, which they enjoyed as students, by denying them access to a valuable collection of works in Theology and Biblical Criticism, in the very city in which they reside, is not only cruel to them, but injurious to the Church.

Have you anything more to suggest?—There is one thing I would be deficient in duty were I not to mention, and it is a very serious matter. It consists with my knowledge, that two or three individuals, whose views were directed to the Church, took out tickets for some of the previous classes, and gave extremely defective attendance on those classes, if indeed it could be called attendance at all. One of them, at least, was scarcely ever in town.

And was it on such attendance that they were received and admitted into the Divinity Hall?—Yes. They presented to the Professor of Divinity just as good certificates as those who had attended daily; and it was on that account impossible for him to discover the fact.

Was there any considerable portion of students who so attended?—I knew three.

Contemporaries of your own?—Yes.

And were those persons never checked in that?—Never, in so far as I know or heard. One of them came in about new year time, or about the old style holidays, and showed face for about a week, or not so long; and then, about the end of the session, when the Professor asked the tickets, he came to the class, and gave in his ticket to the door-keeper, who, after a few days, returned it with a certificate.

What may have been the length of attendance?—The person whom I have just now referred to, and who was schoolmaster of a country parish, could not have attended more than ten or twelve days in the session; and another of the three, who, to my certain knowledge, was employed in teaching in Edinburgh the same hour in which the lectures were delivered in the class for which he had taken out a ticket, contrived to be present on the Saturdays. Of the third person's attendance, my recollections are not distinct enough to enable me to say with exactness what its amount might be.

Has the person you first referred to obtained a licence as a preacher?—Yes, and something more.

Could that have occurred, if a Catalogue had been regularly called every day?—No. There was a talk of such a thing as calling a roll when I was attending the Divinity Hall; and I mentioned what I have now stated to the Professor of Divinity, who, as he intended to state the circumstance to the Senatus Academicus, with the view of getting them to adopt the calling of a Catalogue, requested me to tell him the names of the individuals, which I declined doing. The Professors from whom the tickets were taken, I am quite sure, were not aware of the fact. If the roll were called every Monday, and once or twice a-week, always shifting the day, so that the students could not be aware of it, the Professor would discover those who did not give attendance. My reason for saying *every Monday* is this, that a good many of the

University of Edinburgh.

Rev A. Bullock.

29 May 1827.

students who go out of town to visit their friends on Saturdays, do not return till the Monday afternoon or the Tuesday morning.

It was not the practice then to call a Catalogue?—No, at least not in the Logic, or Mathematical, or Natural or Moral Philosophy Class.

Was it done in the Divinity Hall?—Regularly. There is another case which I may take the liberty of mentioning, that by drawing attention to it, steps may be taken to prevent the like from happening again. It is the case of a young man who applied to Aberdeen College for the degree of Master of Arts on false representations, alleging that he was about to publish a book, and that it would be of great advantage to him to be able to affix a degree to his name on the title-page: this was about ten years ago, and I know that the book is not half finished yet. He got his degree, although he had not attended either Greek or Natural Philosophy here—at least there were classes which he had not attended, and which he could not attend, for he himself told me he was otherwise engaged at the very time. He came to the Divinity Hall with his diploma. Now the law says, he must have *either* attended four years, *or* have got a diploma; and when he came to Dr. Ritchie,—not indeed with certificates of attendance for four years on all the prescribed classes, for he had no such certificates to show, but with that which the law declares to be tantamount to such certificates—with a diploma of Master of Arts,—what could Dr. Ritchie do? He had no evidence of the facts before him; he could not but enrol him.

COLLEGE LIBRARY.

[The two following Papers from Drs. Brunton and Duncan, Librarians of the Edinburgh College Library, contain their observations on the Suggestions of Mr. Haig, in regard to the management of that Library. These suggestions are on p. 497 of the Evidence, and a copy thereof, suppressing the author's name, had been transmitted to these gentlemen, with a request to be favoured with their observations thereon. The two Papers referred to were presented to a Meeting of the Commissioners, held on 10th July 1827, and ordered to be printed.]

Remarks on the "Suggestions submitted to the University Commissioners, relative to the Management of the College Library."

Dr. Brunton.

10 July 1827.

I entirely concur in the general principle with which the "Suggestions" are introduced,—That the leading object in the management of the Library ought to be the "benefit of the students." I have uniformly acted upon this principle, ever since I have had any charge of the Library, especially in the arrangements made with reference to the new buildings, intended for its accommodation. I believe myself to be guided by the same principle in the remarks which I now beg leave most respectfully to submit.

I shall endeavour to state, as briefly as I can, what has occurred to me on each of the Suggestions, in their order.

1. The Library funds could, in their present state, very ill afford the expense of additional assistants. From the arrangements which are to be adopted in the new apartments, it is hoped that the present strength will be more effective there than it is now. It must be kept in mind too, that in proportion as the number of assistants is increased, the advantage which they derive from local memory becomes less.

The matriculation has, for the last three years been conducted, not by one of the usual assistants, but by the catalogue-writer; and some similar provision will continue to be made for it.

2. I fear that such a receipt-book as is here proposed, would be much more cumbrous than the one now in use, without any adequate benefit. Whatever increases the necessity of explanation between the Librarian and the students, is an inlet to great waste of time.

The students are, in general, far from keeping out the books for an unreasonable period.

3. I have no reason to think that the deposits are felt by the students as a hardship. The poorest of them must have some little money in reserve for settling their bills at the close of the session, and it is safer in the Librarian's hands than in their own.

Since I have had some charge of the Library, there is only one instance of a student's complaining to me that it was inconvenient to deposit the money for a book which he wanted. Having satisfied myself of the truth of his statement, I allowed him to have the book on my own responsibility.

The *Class Tickets* could not be made a sufficient guarantee without a system of checks and counter-checks, very harassing to all the parties concerned. To accept 'security' from the students would, I am afraid, lead to delay and irritation—far more inconvenient for the students themselves than the present practice.

4. The abuses to which the practice here recommended might obviously give rise, would, I fear, very greatly exceed any benefit which could ever attend it.

5. The books would all of them be full bound, if the funds of the Library could bear the expense; but, after all the economy which can be practised, the sum reserved for the annual purchase of books is by far too small.

The half-binding is well executed. The finishing of the books is carefully examined when they are in by the binder.

6. Nothing could interfere more with the comfort and benefit of the actual students, throwing open the Library to all who have formerly studied here.

Any literary man who wishes to obtain from it the use of a book which cannot be easily procured elsewhere, is sure of receiving every accommodation which the Curators and Librarian can give him.

7. The hours of attendance could not be increased in winter without introducing candles into the Library—a practice which would, in various ways, be both inconvenient and dangerous.

8. This has been carefully attended to in the arrangements made for the New Library.

I have thus used the freedom to submit what has occurred to me on the different "Suggestions." I have only to add that, though I have not been able to satisfy myself of the practical utility of most of them, I shall do every thing in my power to ensure for such as the Commissioners may be pleased to approve a full and favourable trial. Without an intimate acquaintance with the details of the Library management, it is not easy to anticipate how often what promises well in theory will be found either impracticable or injurious. (Signed) Alex. Brunton, *Joint Librarian.*

Edinburgh College, 12th June 1827.

569

University of Edinburgh.

Dr. Duncan, junior.

10 July 1827.

In compliance with the requisition of the Right Honourable the Commissioners appointed for the visitation of the Universities and Colleges of Scotland, I have considered with attention the printed paper entitled "Suggestions relative to the management of the College Library of this University," and beg leave to make the following remarks, arranged in the order of its paragraphs.

The leading object of the institution of all University Libraries, is for the benefit of its members. In Edinburgh, these are only the Professors and attending students. The public acts of Queen Anne and George III. were for the benefit of the members of the Universities upon whom the privilege was conferred.

Students, for their own benefit, ought to possess the text-books used in the several classes they attend, and ought not, and cannot be supplied with these from a public Library, as they must keep them during the whole session.

The management of the College Library, since I have been connected with it, has always been conducted upon the most liberal and encouraging principles, consistent with its preservation.

The principles upon which the detail of the management of the Library is regulated, are—1*st*. Regularity; 2*d*. Dispatch; 3*d*. Impartiality; 4*th*. Economy. Keeping these in view, I shall now make some remarks on each of the Suggestions.

1. At present the Under-Librarians in office find themselves competent for the service of the students. Indeed, one of them has been only lately added, in order to instruct him for service in the new Library, and in removing the books. It is, however, possible that more attendants may be usefully employed when the Library is removed to the new apartments; but this can be determined only by experience. It is a great mistake to suppose, that by increasing the number of servants, the work is proportionally better done; and the great difficulty in public establishments is to prevent their unnecessary increase. When I became Librarian, there were two Under-Librarians, who received, the one £30, and the other £14 per annum. Mr. Duke Gordon had previously performed the whole duty for £30, and a gift of £5 annually. Now there are three attendants in the Library, at £105, £84, £52, besides a gentleman employed in transcribing the catalogue at £40. It is by this assistant that the matriculation is conducted, and not by any of the regular Librarians.

2. The present system of keeping the Receipt-book is much preferable to that proposed, for all useful purposes. In the framing of the present system, as much detail was avoided as possible, that the service of the students might be quickened, by doing away with the necessity of much conversation between the student and the Librarian, and the delay arising from it, in passing speedily from the service of one student to another. It is found, in fact, by experience, to afford the greatest facilities, both to the students and to the Librarians, and also to furnish, in an easy way, every security to the Library for the safety of books, by means of deposit. It is even doubtful whether the signing of the receipt by the students should be continued, as it takes up time, and affords no additional security.

The proposed plan, without any advantage, would be attended with many inconveniences. Those who have even tried to catalogue books, know that it is not always easy to fix upon the letters of the alphabet under which a book should be entered. Under certain letters, the number of books to be entered would cause time to be taken up in finding the place of each when returned. The receipt-books would be cumbrously large, and the constant turning over of the pages would be troublesome, and would at last destroy them. This inconvenience would be doubly felt when one set of books was filled in one letter, and a new set must be begun. The signature of the student for each individual book, would be an unnecessary waste of time. There is no advantage to be expected from having an alphabetical list of the books out, or from knowing the date when each was borrowed; the alphabetical list would not give information as to what books were out—for, from economy, more than one book is often bound together, and only one would be entered; neither would the smallest advantage arise from inserting the residence of the student, or the class or classes he attends, as the one is often changed, and the others are so various. But if these details should be thought of importance, it would be easy to ingraft them on the present system, by means of additional evening labour, and to make an index for the titles of books borrowed by the students, as is done for the Professors and Surgeons. The present system of having an account with each Professor and Surgeon cannot be altered; and the system for the students should be similar. The more I consider this subject, the more am I convinced of the superiority of the present system over that proposed.

3. With regard to the third suggestion, there is no instance known to the Librarians, in which the deposit-money has been felt inconvenient—and without it the Library would suffer materially. Indeed, many students consider the deposit as a useful security, upon which they only draw when absolutely necessary, or when going away. The Professor's tickets would be no guarantee for the safe return of books; the Professors often give a second ticket when the first is said to be lost, and grant certificates of attendance besides the ticket. Upwards of 1800 students attending College do not apply at all for certificates requiring the production of their tickets. The idea of taking security by letter from a second person, for the safety of books lent out to students, would only lead to a train of business, which it must be evident would create difficulties.

4. The fourth suggestion, which proposes that all new books should be laid on the table, is preposterous. It would be injurious to the students, and would diminish the utility of the Library. Nothing is more hurtful to students than desultory reading. Their text-books, and the works recommended by their teachers, should engage their whole attention.

5. With respect to the binding of books, there is no doubt that it would be of advantage to have all our books full bound; but the Library has not sufficient funds to do so.

6. In answer to the sixth suggestion—If all those who have studied here, and who are resident in Edinburgh, were granted the privilege of using the Library, the interest of the attending student would be very materially affected, and his opportunity of reading would be completely abridged. Gentlemen engaged in literary and scientific pursuits are accommodated on proper application being made to the curators; and such as have only occasional references to make to particular works, whether they be known to the Librarians or not, are never refused. Attending students pay but 5*s*. 6*d*. per annum to the Library, and for so small a sum, the actual use they may have of it is quite a sufficient return. The sum paid by each student to the Joint Matriculation and Janitors' fund is 10*s*. per annum. A degree may be acquired by four years' study; and to give the perpetual use of the Library for 22*s*. of contribution is an excess of liberality. Besides, were such a privilege given, it would be making the University Library the cheapest subscription library in Edinburgh, and lead to its destruction.

7. The hours of attendance at present are thought sufficient. Some alterations, however, with respect to this may be made when possession is taken of the new Library, should they be thought

University of Edinburgh.

Dr. Duncan, junior.

29 May 1827.

necessary. An arrangement might be made, by which students might leave their written applications for books, and return afterwards, when the answers might be immediately given.

8. What has been mentioned in the eighth suggestion has been for many years in practice,

9. As to the last suggestion, it is quite contrary to my experience. In almost every instance, when I have exercised my discretion in giving a greater latitude in the use of the Library, it has been abused, and it is not withdrawn without giving great offence. Nor have we often received from persons so indulged any donations.

The last remark would apply with more propriety to the Advocates' Library, but the privilege of the University Libraries is for the benefit of their members directly, and indirectly only for that of the public. (Signed) ANDREW DUNCAN, Jun. *Librarian.*

Edinburgh College, 18th June 1827.

London, Argyle-House, Friday, 1st June 1827.

Present—The EARL of ABERDEEN, the EARL of ROSEBERY, the LORD BINNING, the LORD ADVOCATE.

The EARL of ABERDEEN in the Chair.

(*This Evidence was reported to a Meeting of the Commissioners, held at Edinburgh on 10th July* 1827, *and received by them, and ordered to be printed.*)

Sir *James M'Grigor,* Director General of the Army Medical Department, was called in and examined as follows :—

Sir J. M'Grigor.

June 1827.

Have you had the means of knowing the Course of Education in Edinburgh required for a Medical degree?—I have.

In your opinion, is the course followed there as good as can be adopted; or have you any improvements to suggest?—The course now adopted in Edinburgh is a very great improvement on that which had been pursued before, by the addition of one year to the Curriculum of Study, and the additional branches of Medical Science, and of the collateral branches of Medicine enjoined by the new regulations; I am, however, of opinion, that the more extensive the education, previously to commencing the study of Medicine, is, the better. I look particularly to the public service.

Does the Course of Study actually pursued at Edinburgh include the objects you require, to qualify such persons for service in the Army?—The Medical Officers of the Army are of various ranks or classes. For the junior or lower, the present system at Edinburgh, or even that pursued before the recent improvements, abundantly qualified gentlemen; but for the superior classes, particularly the Staff-Surgeons, Physicians to the Forces, and the Inspectorial Officers, something further is very desirable, and is now expected. By the Regulations in the Army, one class, the Physicians for example, are required to be Fellows or Licentiates of the College of Physicians of London, or Graduates in Medicine of Oxford, Cambridge, Dublin, Edinburgh, Glasgow, or, under the recent regulations of the Universities of Saint Andrews or Aberdeen, at most of those a previous University education is required; and at some of them, as at Aberdeen, it is necessary that the Candidate for the degree of Doctor in Medicine shall previously have taken the degree of Master of Arts. In so far as it is practicable, I am of opinion that some previous knowledge of Mathematics, Philosophy, and Natural History, should be required at Edinburgh.

Cannot a Graduate of Edinburgh fill any of those situations?—Yes; and they have generally been found very competent to fill every office in the Army, and not a few of them have been Masters or Bachelors of Arts, or have acquired a knowledge of Natural History, Mathematics, Natural Philosophy, Moral Philosophy, and Logic, at Colleges or Academies, in addition to a very competent knowledge of the Greek and Roman authors, and some of them have been well versed in the Oriental Languages; but I consider that it would be desirable that a knowledge of these should be by some means ascertained previously to the degree of Doctor in Medicine being conferred on them. If it were not deemed expedient at present, that all should possess the degree of Master of Arts or Bachelor, their knowledge of some branches of Mathematics, of Natural History, and Natural Philosophy might be ascertained by the examination of the Professors, in the same way as that of the Greek and Latin Languages is now so properly done by the Professors at Edinburgh. I would beg to state to your Lordships, that the regulations of the Army Medical Board, sanctioned by his late Royal Highness the Duke of York, are as follows, on this subject.—[*See printed Paper A. in App.* p. 533.] He who is a candidate for his Majesty's Commission as a Medical Officer in the Army, must possess a diploma of one of the Royal Colleges of Surgeons of London, Edinburgh, or Dublin, and must produce certificates of two years' attendance in an Hospital, with one on Practical Pharmacy, and he must also exhibit certificates of regular attendance on Courses of Study on the following branches of professional knowledge at established schools of eminence: —Anatomy, eighteen months; Practical Anatomy, twelve months; Chemistry and Practical Chemistry, six months; Materia Medica, three months; Botany, three months; Surgery, six months; Theory of Medicine and Physiology, six months; Practice of Medicine, six months; and of Clinical Lectures on the Practice of Medicine and Surgery. These are the branches which are required for the Army. Practical Anatomy is, at Edinburgh, one of the branches which is left to their choice. We require a distinct course of Surgery, as separated from Anatomy—we require separate courses of Clinical Lectures on Medicine and on Surgery. Whatever may have been the previous education of the candidate for the Army, and at whatever College or School he may have acquired his knowledge, the regulations require that he should pass an Examination before the Army Medical Board, which at present consists of two members, Sir William Franklin and myself. Further, it is required that every Medical Officer, on coming from the half-pay to employment on full-pay, and every Officer before attaining a

571

University of Edinburgh.

Sir J. M'Grigor.

1 June 1827.

step of promotion, pass an Examination upon the progress or improvement each has made, and his fitness for promotion is ascertained: we set apart two days of each week in the year for these Examinations.—[*The witness delivered in Papers marked A. and B.*, pp. 533, 4.]

In your opinion, is the Course of Education now pursued at Edinburgh sufficient, or is it defective, for the purpose of providing persons in the Medical Department for the Army; and if defective, have the goodness to state in what respect it is so defective?—I am not prepared to say that the Medical Education at Edinburgh is defective. I have reason to know, that although not enjoined at that University, many of its Graduates in Medicine have a knowledge of Natural History, and the different branches of Philosophy; but, if practicable, I am of opinion that it would be better if this were enjoined, and that the knowledge on this subject was ascertained by examination.

Do you find that the pupils who come from that University, and are under your observation in the department over which you preside, are sufficiently educated in Medical Science?—I consider those educated at Edinburgh to be equal to any in the Medical Department of the Army.

You are of opinion it would be an improvement in their education, if, upon what may be called the natural branches of knowledge, they were more completely versed than they are at present?—I have no doubt of it.

Referring to the qualifications required in the paper you have just referred to for the higher branches of the department, have you found that those who have attended only the Scotch Universities, are less distinguished than those who have attended the English and the Irish Universities?—They are not upon the whole, although there may be some exceptions. Looking to the last year, during which my colleague and myself examined about a hundred gentlemen entering the Army, I think there were more of them Masters of Arts, or Bachelors of Arts, from Ireland, than from any other quarter. We get fewer recruits from England than from the two sister kingdoms: while the number coming from Ireland and Scotland is nearly the same, that from England is much less than either.

Have you found that those who have been educated solely in Scotland are less distinguished for their acquirements in Literature and the liberal branches of Science?—Certainly not.

In regard to the opinion you have expressed with respect to the individuals who come from the University of Edinburgh, would you form the same opinion as to those who come from Glasgow and the other Scottish Universities?—Of late years, Glasgow has been rising much in celebrity as a Medical School; and several of the classes there are now taught by some of the most distinguished men in Europe in their own branches of Science.

Glasgow is esteemed a very considerable Medical School?—Undoubtedly: it is particularly distinguished for its teachers in some branches, while Dublin is for others, and Edinburgh for others.

It would appear from your evidence, that the only idea of improvement in education is with respect to general knowledge and Literature, and not with regard to the Medical Science particularly?—That is my opinion on the question in general.

Would you not recommend an extension of Clinical Practice?—I consider Clinical Lectures of the very first importance; and that there ought to be a Professor of Clinical Medicine and of Clinical Surgery in every Medical School; and that attendance on them should be held indispensable to Physicians and Surgeons. Properly conducted, a Clinical class is the most valuable to the student—it is the most practical. I think it would be beneficial to the public if, where there is a county or public Hospital or Infirmary, it was enjoined on the Physicians and Surgeons to give a regular course of Lectures on the cases of the patients, not less than twice or thrice a-week—thus illustrating the Practice of Physic and Surgery, and explaining the principles on which any plan of treatment was pursued by the Physician or Surgeon.

Generally speaking, greater attention is bestowed upon Clinical Lecturing on the Continent than in this country, is it not?—Much greater.

With respect to Military Medical Practice, you think it peculiarly advantageous?—I consider it indispensably necessary to the perfect instruction of the student.

And in Surgery even more so?—I consider Clinical tuition to be equally necessary in Surgery, as in the Practice of Physic. This important branch of Medical education was introduced into this country at Edinburgh, I believe, nearly as early as in any part of Europe; but in this kingdom it is still nearly confined to Edinburgh. In the opinion of many, the mode of Clinical Lectures at Edinburgh admits of some improvement; and perhaps it might be better, if this branch was in the hands of two individuals selected for the purpose—a Professor of Clinical Medicine, and a Professor of Clinical Surgery. Indeed, the Surgery has been for years in the hands of one of the ablest Surgeons, but that of Clinical Medicine passes from one Physician to another. The opportunities for this branch of Medical Science are excellent in London; and I have heard that it is in agitation to pursue Clinical instruction at the different Hospitals.

Its not having been effected has not arisen from any doubt of its necessity and propriety, but from difficulties of another sort?—Just so.

Is it found easy on the part of the Managers of the different Hospitals?—If the object were explained to them properly, I think there would be no difficulty in it. It would, I think, be particularly beneficial to the patient; for the Physician must bestow a considerable portion of time and attention on the particulars of his patient's case, and will consider the proper treatment before he would venture to dilate on these, and lecture on them to the student.

There are no apprehensions entertained from the wards being crowded with students?—With proper arrangement, and a due discretion exercised, I entertain no apprehensions.

Do you think the institution of a class of Military Surgery at Edinburgh was a beneficial

University of Edinburgh.

Sir J. M'Grigor.

1 June 1827.

addition to the course of Medical study?—In so far as the public service is concerned, the Army, the Navy, and the service of the Honourable East India Company, I think it has been a most beneficial addition to the Chairs of the Medical School at Edinburgh. Besides wounds, and what is termed Military Surgery, the economy of Hospitals, and of Hospital arrangements, is in this school taught by a gentleman who has served much in the field and in various climates. At the end of the last war, upwards of 300 Medical officers of the Army were placed on half-pay; and it is within my knowledge, that many of them profited greatly by attendance on this class, and before they returned to employment on full-pay.

Is it a useful class for persons to attend, who are not to be attached to the Army, but to practise as Surgeons in the country?—Not more than any other class of Surgery, unless in so far as the observations of a man are valuable who has seen much of some branches of Surgery that rarely fall to the lot of Surgeons in civil life, and who has performed some of the operations more frequently.

Do you think it would be desirable to have a Professor of Practical Anatomy?—Undoubtedly, Practical Anatomy is of the last importance to the Medical student, and to the Surgeon it is indispensable. In most schools, while the Professor or Lecturer gives Lectures on Anatomy at one hour, his assistant, the Demonstrator, teaches Dissection, and points out all the parts at another. I have not sufficiently considered the subject, to be enabled to state that a Professor of Practical Anatomy is necessary, but I have ever considered the plan pursued in Dublin in teaching Chemistry to be excellent, and worthy of imitation. There, while the teacher of Chemistry lectures on his subject at one hour, illustrating the facts by experiments, his assistant has a class at another hour, when the students get the materials for the experiments, and are made to perform them themselves—thus strongly impressing on their minds all the facts of the Science.

Are you aware, that at present the Professorship of Surgery, and the Professorship of Anatomy, in the University of Edinburgh, are held by one and the same person?—I am.

Do you think it would be an object of importance to disunite them, and to have a separate Professor of Surgery?—Certainly. Surgery is so important a branch that I consider it requires a Professor who has no other subject on his hands.

Do you think those might be separated with advantage?—Although in many places Anatomy and Surgery have been taught together, and well, yet I think it would be a great improvement to have a Professor for each of these important branches; indeed, I consider it indispensable to teaching the two branches perfectly.

Supposing the Professor of Anatomy to lecture for six months, do you think that six months is more than sufficient for the study of Anatomy alone?—A full or perfect course of Anatomy cannot be given in less time than six months.

Are there various courses of Lectures in London on Medical subjects?—There are various courses of Lectures in Medicine and Surgery in London, and the number of teachers is very great, and has increased very much of late years. There are usually two short courses, the first commencing in October, and ending in January, and re-commencing in January, and ending in May.

Where are those taught?—Almost every one of the large hospitals in London has its School of Medicine, where the branches usually taught to the pupils are Anatomy and Surgery, Practical Anatomy, Chemistry, Practice of Physic, and Midwifery. There are likewise a few Lectures in London on Botany, Natural Philosophy, Diseases of the Eye, Diseases of the Ear —not unfrequently Practice of Physic, Theory of Medicine, Chemistry, Materia Medica, and Botany are given in one course by one teacher.

Are all those teachers appointed by the Managers of the Hospital?—In so far as my information goes, the appointment of the Lecturer is by an arrangement between the Governors and the Physician and Surgeon of each Hospital: but, in addition to the Lecturer attached to the Hospital or School, any individual is at liberty to take up any branch of Medical Science, and lecture on it; and it not unfrequently happens that there is a set of teachers within the Hospital, and another set, their rivals, without.

Do you not think it is a very great objection, in point of fact, that the present Professor of Anatomy in Edinburgh, who is also Professor of Surgery, is not a Practical Surgeon?—I am of opinion that the Professor of Surgery ought always to be a Practical Surgeon.

Adverting to that which you stated in the commencement of your evidence, do you think it would be a safe and judicious course to require from every one who graduates as a Doctor of Medicine, either that he should previously have graduated as a Master of Arts, or, if that should be found difficult, that he should undergo an examination sufficient to show that he might have graduated as a Master of Arts?—I think it most desirable, that in some manner it should be ascertained that the candidate for the degree of Doctor of Medicine has a competent knowledge in the branches of Science which I have stated.

Why should the degree of Master of Arts be rendered more indispensable at Aberdeen than at Edinburgh?—It is more easily attained at Aberdeen, the general expense to the student being very moderate there in living, fees, &c.; and, without imposing regulations which, to many, would amount to an exclusion from a Medical degree, the University education, and that for Medicine may be (and at Aberdeen are, I believe) accomplished in six years, thus: After passing the first year in the Greek and Humanity classes,—the second in that for Natural History, 1st, Mathematical, 2d, Greek and Humanity classes,—the student can then, in his third year, commence Medical Science; and, while he attends the class of Natural Philosophy and second Mathematical class, he can likewise attend the Clinical class, and perhaps commence Anatomy. In his fourth year, while he attends the class for Moral Philosophy and Logic, he can again attend the class of Anatomy with those for Theory of Medicine, and Clinical Lectures twice or three times a-week at the Infirmary. After taking the degree of

573

University of Edinburgh.

Sir J. M'Grigor.

1 June 1827.

A.M., he can, in two years more, study the remaining branches of Medical Science which qualify him to be a candidate for the degree of M.D. If his means or inclination lead him to spend seven years in this way, it may always be accomplished with the greatest ease.

So that the whole course would be six years?—Yes, I think it may be done in six years; and considering the early age at which young men are sent to an University in Scotland, the Doctor in Medicine will enter on the exercise of his profession at a sufficiently early age.

Do you think it would be advisable to require in Graduates in Medicine, a competent knowledge of Classical Literature?—I think it necessary that they should possess a competent knowledge of Classical Literature.

An adequate acquaintance with Greek, as well as Latin?—I think an acquaintance with Greek, as well as Latin, indispensably necessary.

The principle of such acquirements is admitted?—In the Examination at the Army Medical Board, the previous education of candidates is inquired into, and their knowledge of the Greek and Latin languages ascertained.

You do not think any rational objection could be founded on the notion that such a regulation would be the means of sending forth a number of young men to practise in the country without a degree, and therefore without any means of ascertaining their qualifications in any of the branches of Medical Science?—I confess I have sometimes had my doubts on the subject, particularly if any regulation was suddenly adopted which required a very high rate of qualification, such as was unattainable by the mass of those who now study at the Scotch Universities. I have heard, that since of late the College of Surgeons and Society of Apothecaries of London have required higher qualifications than formerly, some evaded their examinations and regulations, and continued to practise without any examination. I am, however, induced to believe, that if the regulation in regard to general service was made prospective in regard to the Scottish Universities, and introduced gradually, there need be no rational apprehension. It is my belief that a great portion of those who now yearly obtain the degree of Doctor in Medicine in Edinburgh, possess a competent knowledge of the branches of Science alluded to, to enable them to pass any usual examination. I do not consider it necessary for the successful practice of Medicine, that the Doctor should enter into the higher parts of Mathematics, or be deeply versed in Natural Philosophy, Astronomy, or Metaphysics.

Do you think it would be a good thing that the University of Edinburgh should be in the habit of giving Diplomas of Surgery to those who do not take degrees in Medicine?—I have not turned my mind so much to the subject as to be able to speak with confidence on it. I see no objection to it; but I believe that in Surgery the Diploma of the Royal College of Surgeons is considered equivalent to a degree.

Are you acquainted with the regulations of the Royal College of Surgeons at Edinburgh for admission?—Yes; they appear to me to be very good, and the Course of Study enjoined to obtain their Diploma is a very proper one.

Are you aware that in the University of Glasgow the same Professor has taught both the Theory and Practice of Physic?—Yes; and this appears to me to be improper. The Theory of Medicine, which includes Physiology, is an important branch of Medical Science, and requires the whole attention of one teacher, however highly qualified, to teach it successfully.

Have you any suggestion to make for the improvement of the study of Medicine or Surgery in any of the Scotch Universities, and particularly with respect to your department?—I am not at present prepared to make any suggestion; but, if other matter should occur, I will not fail to submit it to your Lordships.

William Burnett, M.D., Medical Commissioner of the Navy, was called in and examined as follows:—

Dr. W. Burnett.

Are you acquainted with the present Course of Medical study in the University of Edinburgh?—Yes. Many of the Medical officers admitted into the Navy are educated in Edinburgh, and we have, therefore, frequent occasion to refer to the Course of Education pursued in that University.

Are you aware of an alteration lately made in the Course of Study?—I know the Senatus Academicus has lately added another year to the Curriculum, unless the candidate shall have been employed in the Navy, the Army, or the East India Company's service; they then abstract one year from the said course.

Should you say that the present Course of Study in the University of Edinburgh was fully sufficient to qualify Medical practitioners for the Navy?—I should think, generally speaking, it is. We have generally found them very efficient, particularly those who have taken degrees; so much so, that if a gentleman was to present himself with a degree from Edinburgh to us, without any recommendation or interest whatever, we should prefer him to one recommended by the most powerful interest, who had not such a qualification. We have laid down a Course of Education for our Medical Officers, which perhaps it may be desirable for your Lordships to see.—[*The witness delivered in the same—vide C. p.* 534.] It is somewhat different from the University course, for we insist upon more Practical Anatomy than the University course requires. I believe it is considered sufficient, in taking a degree, that the young man should have taken out one ticket in each class; we require eighteen months of Anatomy and the same of Surgery, and we require likewise a twelvemonth of the Practice of Physic, and twelve months of the Theory of Physic. A candidate for the degree of M.D. may obtain it, if he pass the required examinations, with an attendance on one course only of each of these.

Are you aware of any deficiency in any branch of the Medical Education pursued at Edinburgh?—The very great difficulty of obtaining subjects for dissection occasions a deficiency

University of Edinburgh.

Dr. W. Burnett.

1 June 1827.

of Practical Anatomy, which has been much complained of there; and I am quite of opinion, that without a knowledge of Practical Anatomy, which is only to be gained by dissection, a man can never make a thoroughly good Surgeon; and I consider it a very material object that the student, after he has obtained a knowledge of the elementary branches of his profession, should pay great attention to the cultivation of Clinical Medicine and Surgery.

Do you consider those not sufficiently attended to at present in Edinburgh?—Perhaps they are; they have more opportunities in Edinburgh than in some other places; but I think they are still susceptible of improvement. My colleague and myself consider it of so much importance to the Medical Officers of the Navy that we have formed, under the direction of the Admiralty, (at Haslar,) a Museum and Library for their use, and there is likewise a Lecturer appointed; but there are some difficulties, which we hope hereafter to remove, of instituting immediately a course of Clinical Lectures. We mean, however, to do so, as soon as it can be arranged. Our present assistants accompany the Physician and Surgeon round the wards, and observations are made to them by these officers on the cases; and for the same purpose we have an extra number of assistants, both at Plymouth and Haslar Hospitals, who, after a certain number of months, are then embarked in ships of war, and, in consequence, are found much more efficient.

Is it limited to any number?—To six extra at Haslar, and four at Plymouth. Lord Melville was exceedingly liberal about it, and came into everything which was suggested. We hope hereafter to extend the utility of the establishment.

What number of students do you think might go through the Clinical Lectures with effect?—I think too much crowding is greatly against the progress of the student, and likewise disturbs the patient, which is our principal objection at Haslar; sailors are easily prejudiced, and we are obliged to be careful in everything we do with them.

With a view to the students, do you think more than twenty could attend with advantage?—I should think that number would be the greatest which could attend with advantage.

Do you think a separate Professor of Surgery at Edinburgh would be of advantage?—Yes, I think it might be separated from the Anatomical course with great advantage.

And taught by a Practical Surgeon?—Yes.

Have you found that the institution of the class of Military Surgery at Edinburgh was advantageous as regarding your department?—I cannot say that I have observed any great effect from it. I am not aware that the students are compelled to attend this class; they have not often a superfluity of money, and they attain, perhaps, as much as they can afford; but I believe it is a very general case, when the Medical Officers of the Navy go back to renew their education, that they attend this class; and we endeavour to give them every facility of improving their knowledge which the service will admit of.

Are you acquainted with the additions that have been lately made to the Curriculum in the University of Edinburgh?—I understand that they have lately required Midwifery.

There has been an extension of the time?—Yes, they have made an extension of one year, making it four instead of three, provided the student has not been one year employed in the public service; and they have had an intention of examining in English instead of Latin. A gentleman of high respectability in the University communicated with me some time ago on this subject, and I replied, that though I thought it would be wrong to give up a knowledge of Latin, I recommended very strongly that the examination should be conducted in English, as the student's acquirements could be better estimated by this means.

You do not think that the examination in English ought to supersede the acquirement of a competent knowledge of Latin?—Certainly not.

You think that the new regulations are a material improvement?—Certainly.

Are there any others you would suggest?—It does not occur to me at this moment that there are. The subject has not, however, altogether escaped my attention.

Have you turned your attention to the question of the previous education?—Yes, I have reflected upon it a good deal. In our regulations for the admission of Medical Officers into the Navy, we have required a competent knowledge of the Latin; and when a candidate appears before us, we expect him to be able to read with ease Home's Principia, or Celsus, and the Pharmacopœia of the London College.

Do you think it would be an advantageous thing, or that it would tend to raise the Medical profession, if all candidates for graduation in Medicine were bound to produce qualifications, or to undergo an examination, showing a competent knowledge of the different branches of liberal Science and of Classical Literature in both its branches?—I think there can be no doubt of this as an abstract question; but I should doubt the possibility of enforcing it extensively; it would very much limit the number who would be able to acquire such qualifications.

Do you think there would be any great disadvantage from a limitation of the number of Doctors of Physic?—I am not certain that there would.

Applying these observations to the department over which you preside, what is your judgment?—It would be of little consequence in the Medical department of the Navy; but I should think that the talents of a Physician would be very much improved by so liberal an education; at the same time I do not see the absolute necessity for it, as it regards the treatment of disease: I mean this with reference to the *very superior preliminary education* pointed at by the question.

Is there a large proportion of the Medical Practitioners in the Navy educated in Scotch Universities?—Yes. Anticipating the question, I have had an account prepared of the Medical Officers admitted into the Navy since 1821; there are ninety-one who have been educated in London, ninety-one at Edinburgh, and fifty-nine at Glasgow. The figures relate to the degree of qualification we consider them, after due examination, to possess, and which guides us in

5/5

University of Edinburgh.

Dr. W. Burnett.

1 June 1827.

considering of their disposal and future promotion, &c. If there is anything extraordinary on the examination of an individual, I keep a private memorandum of it for my own guidance afterwards. [*The witness delivered in the paper, D.* p. 535.]

Are those wholly educated at the places against their names?—Yes.

Do you think there would be any risk of the public service being injured, if the University of Edinburgh were to give diplomas in Surgery, at the same time that they raised the qualification necessary for taking a degree in Medicine?—I do not think it would.

Do you conceive the diploma in Surgery would ensure the requisite knowledge for the various branches of the service?—The fact is, that in the public service to which I belong, though we make it a *sine quâ non* that candidates should undergo an examination before one of the Colleges of London, Edinburgh, or Dublin, yet we do not entirely rely upon that, but upon our own personal examination of the students afterwards; and with us they pass a perfectly fair, but a very strict, examination.

In the result of those examinations, there is no part of the Medical Study, as pursued at Edinburgh, that occurs to you as necessary to be improved?—It does not occur to me that there is, except as I have already mentioned.

Have you any remarks to make on the system pursued at any of the other Scotch Universities?—I have very little knowledge of them, except the Edinburgh and Glasgow Universities; as we have no immediate connexion with the others, we did not receive their diplomas as evidence of having obtained a Medical education; but I understand a better and different system has now commenced in those Universities, but we have not, at present, any knowledge of the fruits of it. When I came to the Medical Board of the Navy, a diploma of Physician from Glasgow was not acknowledged as entitling the officer to have M. D. placed against his name in the official list; but, after examining several of the students from Glasgow, I thought it an act of injustice towards that University. On inquiry, I found that difficulties had arisen; but, after conversing with some friends on the subject, an official application was made by the Board to the Admiralty, and the matter was then put on its proper footing. At this time the diplomas from Dublin, Edinburgh, Glasgow, and from London, are all acknowledged as competent degrees.

From your knowledge of the education at Glasgow, have you anything to suggest?—I think their education is in general very respectable—quite as much so as in Edinburgh.

Do you think it would be advisable to separate the Theory from the Practice of Medicine, and to have separate Professors for each at Glasgow, as it is at Edinburgh?—I do certainly think it would.

Would it be advisable, in your opinion, to require from those who are to be attached to your department, that they should have attended a class of Medical Jurisprudence?—I conceive it would be very useful; but I am not quite certain that it is absolutely necessary, for, on account of the smallness of many of the vessels of war, and probably the prejudices of the sailors, the Medical Officers could not, on all occasions, have recourse to such minute dissection on board, as a case of death coming under that denomination would require, though it is performed generally in cases of sudden death, agreeably to an article of the Surgeons' instructions. It might, however, be applied to the cultivation of the knowledge and description of healthy or unhealthy situations, and to particular local causes acting on board ships of war on the health of the crew; for example, in the instance of the Pyramus in the West Indies a few years ago, a most dreadful fever arose on board, and it was pretty evident that the fever in question was occasioned by the foul state of her hold. I think, however, that any well-educated Medical Officer, without attending a class of Medical Jurisprudence, would have discovered that; but I instance it to show, how extensive the subject of Medical Jurisprudence may be considered.

Have you any suggestion to make with respect to the improvement of Medical Education in the Scotch Universities, or as connected with your own department; if so, the Commissioners will be happy to receive it?—I should beg leave to suggest the necessity of the student being required to devote a longer period of time to the cultivation of those branches pointed out in the Navy Regulations (C.), and also, as mentioned in my preceding examination, to the study of Clinical Medicine and Surgery.

APPENDIX—(A.)

On the Qualifications of Medical Officers for the Army.

HOSPITAL ASSISTANT.

Appendix (A.)

The Candidate for this, the first appointment in the Medical Department, must be unmarried; not under twenty-one, nor above twenty-six years of age. He either must produce certificates of having served a regular apprenticeship of not less than three years (to a Member of the Royal College of Surgeons, of London, Dublin, or Edinburgh will be preferred), and of attendance, for one year at least, in an Hospital or Infirmary of celebrity; or, if he has not served an apprenticeship, he must produce certificates of two years' attendance in an Hospital, with one on Practical Pharmacy. He is to possess a diploma from one of the Royal Colleges mentioned, and must exhibit certificates of regular attendance on courses of study on the following branches of professional knowledge, at established schools of eminence, viz.:

Anatomy	18 months.	Botany	3 months.
Practical Anatomy	12 do.	Surgery	6 do.
Chemistry and Practical Chemistry	6 do.	Theory of Medicine and Physiology	6 do.
Materia Medica	3 do.	Practice of Medicine	6 do.

And of Clinical Lectures on the Practice of Medicine and Surgery.

It will be considered an additional recommendation to gentlemen entering the service, to have attended Lectures on

Diseases of the Eye, and on Forensic Medicine;

and likewise Public Establishments for the treatment of Diseases of the Eye, and of Mental Derangement.

University of Edinburgh.

Dr. W. Burnett.

1 June 1827.

Gentlemen who have had an University education will always be preferred. It is desirable that all should have studied Mathematics, Natural Philosophy, and Natural History; but a liberal education, and a competent knowledge of the Greek and Latin Languages, are indispensably requisite in every Candidate.

ASSISTANT-SURGEONS AND SURGEONS.

With the above-recited qualifications, Hospital Assistants will be entitled to promotion as Assistant-Surgeons and Regimental-Surgeons; but every gentlemen must have served five years, at least, in the junior appointments, before he can be promoted to the rank of Regimental-Surgeon. In addition to competent professional knowledge, the greater the attainments of gentlemen in various branches of science, the more eligible will they be deemed for promotion.

Gentlemen already in the service, are earnestly recommended to avail themselves of every opportunity of adding to their knowledge, by attending Universities or Schools; for which purpose, every facility in his power will be afforded by the Director-General. They are especially desired to transmit to this Office statements of such classes as they attend subsequently to their Examinations before this Board, either on professional or on other branches of science, that the same may be duly registered here; and every Officer must be prepared to undergo farther Examination before he can obtain promotion, or return to the duties of the service from the Half-Pay List.

PHYSICIAN AND SURGEON TO THE FORCES.

Medical Officers are encouraged to look forward to the appointment of Surgeon to the Forces, and of Physician to the Forces; and to endeavour especially to qualify themselves for either rank, according to the bent of their inclinations, and to their previous studies.

It is expected that the Candidates for the Commission of Surgeon to the Forces, shall have attended a Public Hospital of celebrity at least two years; and it is desirable that one of them should have been passed at a London Hospital.

The rank of Physician to the Forces requires, in addition to the knowledge and experience to be gained in the regular progress of study and of service, that the Candidate should be a Fellow or Licentiate of the Royal College of Physicians of London, or a Graduate of the Universities of Oxford, Cambridge, Dublin, Edinburgh, Glasgow, or, under the regulations lately adopted by them, of the Universities of St. Andrew's or Aberdeen.

Although the British Schools are specified, it is to be understood that Candidates who have received regular education in approved Foreign Universities, or Schools, will be admitted to Examination.

In all the steps of promotion in the Medical service of the Army, they who give the best proofs of diligent exertion in the performance of public duty, and of attention in the acquirement of practical knowledge, by taking every opportunity of adding thereto, will be regarded as the most eligible for advancement.

Army Medical Department.

(B.)

Appendix (B.)

I a Candidate for employment in the Medical Department of the Army, do hereby attest my readiness to engage for general service, whether at home or abroad, and to proceed on duty immediately on being gazetted.

I declare my age not to exceed twenty-six years; that I am unmarried; and that the course of my Professional Education is faithfully detailed.

I also declare that I labour under no constitutional disease, nor physical disability, that can interfere with the most efficient discharge of the duties of a Medical Officer.

(Signature)—

I have pursued the under-mentioned Course of Study, of which I am ready to produce the vouchers for registry. I am now years of age. I studied at the University of from to and took the degrees of

(C.)

Victualling-Office, 23d February 1826.

Appendix (C.)

The Right Honourable the Lords Commissioners of the Admiralty having been pleased to direct, "that no person be admitted to be a Candidate for the situation of Assistant-Surgeon in the Royal Navy, who shall not produce a certificate from one of the Royal Colleges of Surgeons of London, Edinburgh, and Dublin, of his fitness for that office; nor for that of Surgeon, unless he shall produce a Diploma or Certificate from one of the said Royal Colleges, founded on an examination to be passed

* Here add any other qualifications.

5-77

University of Edinburgh.

Dr. W. Burnett.

1 June 1827.

subsequently to his appointment of Assistant-Surgeon, as to the Candidate's fitness for the situation of Surgeon in the Navy; and that in every case the Candidate producing such Certificate or Diploma shall also undergo a further examination before the Medical Commissioners of the Victualling Board, touching his qualifications in all the necessary branches and points of Medicine and Surgery for each of the steps in the Naval Medical Service;" the Commissioners for Victualling His Majesty's Navy, &c., do hereby signify, for the information of those persons to whom it may relate, that these regulations and directions will be strictly adhered to in future; and further, that previously to the admission of Assistant-Surgeons into the Navy, it will be required that they should have received a Classical Education, and possess in particular a competent knowledge of Latin; also

That they should have served an apprenticeship, or have been employed in an Apothecary's shop for not less than two years.

That their age should not be less than twenty years, nor more than twenty-six years.

That they should have attended an Hospital in London, Edinburgh, Dublin, or Glasgow, for twelve months; and

That they should have attended Lectures, &c., on the following subjects, for periods not less than hereunder stated, viz.:—

Anatomy	18 months.	Chemistry	6 months.
Surgery	18 do.	Materia Medica	6 do.
Theory of Medicine	12 do.	Midwifery	6 do.
Practice of ditto	12 do.	Actual Dissections of the Human Body	6 do.

Although the above are the only qualifications which are absolutely required in Candidates for the appointment of Assistant-Surgeon, a preference will be given to those who, by possessing a knowledge of Diseases of the Eye, and of any branch of science connected with the profession, such as Botany, Medical Jurisprudence, Natural Philosophy, &c., appear to be more peculiarly eligible for admission into the service.

It is also to be observed that, by the rules of the Service, no Assistant-Surgeon can be promoted to the rank of Surgeon, until he shall have been three years in the former capacity; and the Board have resolved that not any Diploma or Certificate of Examination from either of the aforesaid Royal Colleges shall be admitted towards the qualification for Surgeon, unless the Diploma or Certificate shall be obtained on an Examination passed after a period of not less than three years from the date of the party's admission into the Service. *By command of the Board.* M. Waller Clifton.

(D.)

Appendix (D.)

A Statement of the Number of Assistant-Surgeons admitted into the Naval Service between 5th October 1822 and 31st May 1827, with the Names of the Places at which they received their Professional Education; and the Numbers of each Rate or Degree of Qualification.

University of Edinburgh.

Edinburgh, Friday, 27th July 1827.

The EARL of ROSEBERY in the Chair.

Robert Jameson, Esq., Regius Professor of Natural History in the University of Edinburgh, called in and further examined.

Professor Jameson. 27 July 1827.

You have had an opportunity of seeing a Memorial that was given into the Commissioners by Captain Brown: the Commissioners are desirous to know whether you wish to make any observations on it?—I should wish to do so.

We are desirous you would submit to the Commissioners any remarks you have to make now?—I have put some remarks on the margin of the copy of the Memorial that was sent to me, to save time. The first part of the Memorial relates to the request of Captain Brown to be admitted to the Museum—a request he made to a servant. An answer was returned by me, desiring him to wait on me, and desiring him to clear off the debts he owed to the establishment. That answer gave great offence to Captain Brown. He states, in the Memorial, that he was refused admittance to the Museum in the first instance, which was not the case. My message to him was, that he should wait upon me and get quit of the debt. Captain Brown, in place of waiting upon me, writes a letter, in terms very impertinent indeed. The letter was so very absurd, and worse than absurd, that I was at some loss whether to notice it. I had a respect for his family, and I did not wish he should commit himself by impropriety of conduct; and therefore I condescended to request a meeting from him. The note is given in the Memorial:—"Professor Jameson wishes Captain Brown to call upon him to-morrow, Tuesday, in the Wernerian Society-room, at half-past three o'clock.—*Royal Circus, Monday morning.*" Captain Brown made his appearance at the time appointed, and gave some explanation of his letter. I insisted, before saying anything particular to him, that he should retract in writing what he had said, as his statement and threat could not be submitted to. He retracted what he said by writing.

He did retract?—He did, by letter. The thing was so bad, I cannot mention it; but if forced to produce the letter, I shall do it. Then there is a detail of conversation stated in the Memorial altogether erroneous. He says I admitted my message to him was impertinent. That is not true. Then he says I had agreed to a publication of his work. The result of the conversation I shall state: I requested Captain Brown to give me, in writing, a statement of the plan of his work, and I mentioned that I could not take his proposal into consideration till the end of April, or beginning of May, owing to my official and other duties—that I would then consider his proposal.

What was the date of that conversation?—Tuesday, 12th March. The general result of the conversation was, that I requested him, notwithstanding what had happened, to give me a plan of his book, which I would consider; and I appointed, for that purpose, the end of April, or beginning of May. Then follows his letter, and after the letter he says——

For the sake of regularity, it is asked, is that the letter of March 29th?—There is some mistake as to dates here. That of 29th March is the letter to which I refer. Then he says—"Your Memorialist must now mention, that his friend General Stratton had, two days previous to this, sent Professor Jameson a book of the plates intended for his first fasciculus, which were then in his possession, and of which he had spoken favourably to the General on the 27th." That statement is incorrect: what I said to General Stratton was this,—that the plates were ill-drawn and over-coloured,—that the publication might answer as a show-book or a drawing-room book, but could not be of use to Science. That is all I said on the subject. Then the Memorial continues—"Your Memorialist accidentally met with the Professor on the 27th March, when he mentioned that he received his letter, and would immediately forward it to the proper authorities." This statement also is incorrect.

You deny that statement?—I deny the truth of what is there stated. He may have thought I said what he states, but he is wrong. Then follow some details with regard to Sir William Jardine's work, and Mr. Selby's, in which Captain Brown says I would not allow him to draw till I heard from those gentlemen; and that, unless they gave their consent, he would not be allowed to draw. That again is an inaccurate statement. I said I would not allow him to draw until, on conversation with Sir William Jardine, Mr. Wilson, and others, I could determine if the present means of the Museum would afford the necessary accommodation, and if, from my commission, I had power to grant leave to all of them. I have here noted on the margin of the Memorial as follows:—"If Sir William Jardine, Mr. Wilson, Mr. Selby, and others, continued their works, it was probable I might find it impossible to grant the very extensive demand of Captain Brown,—that of drawing every bird in the collection for his *General System*, and which was to appear more frequently than the work of Sir William Jardine." I might probably find, on conversation with those gentlemen, that it would be impossible for me to grant Captain Brown's demand, as his demand was different from their demands.

What was the nature of the accommodation they received?—Allow me to state the nature of their respective works. Sir William Jardine's work is to contain the figures of birds in general. He has occasion to apply but seldom to the Museum, as he has a splendid one of his own; and, when he comes to the Edinburgh Museum, and finds a specimen not fit to draw from, he goes to London or Paris at once for a better one. Mr. Wilson's work is of the same description. He is drawing the more rare and curious objects in the Museum. Captain Brown was to draw all kinds, and therefore I could not say to him at once, "I will grant the permission desired," because, had I first granted permission, and then retracted it, it would have appeared ungracious. Therefore I delayed determining as to Captain Brown's application, till the end of April or beginning of May, when public duties would allow me to give the demand sufficient consideration.

579
University of Edinburgh.

Professor Jameson.

27 July 1827.

Then the only difference between Captain Brown's request, and the others that were granted, was as to the extent of drawing?—As to the extent.

Except that it would take greater time to Captain Brown for his drawings, what difference is there?—I shall state what that is afterwards. Captain Brown afterwards says I granted him an interim permission to go to the Museum. The truth is, I was so tormented with him, that I gave him occasional permission; intimating to him, however, that from official and other duties, I could not make a regular arrangement till the time I had specified.

When you gave Captain Brown occasional permission, was it understood he was to come to you each time when permission was granted?—I gave him a note, stating the particular days when he might be admitted to the Museum, and restricting him as to time.

And, in that note, particular days and time were specified, and at no other days or hours could he have permission?—Such is the case with all those who have permission twice a-week.

Do you mention Captain Brown had permission to go twice a-week?—Yes.

For a certain number of weeks, or how was it?—Till the end of April. This arrangement I entered into in order to get quit of his importunities and absurdities.

Did he act on that permission?—He came, I believe, two or three times; and he and the servants got by the ears, as usual. I was quite indifferent as to what took place, having stated, at the outset, that I could do nothing final with regard to his application till the end of April. Next, in his Memorial, finding that I would not alter a resolution dictated by my public duties, he (Captain Brown) writes to the Secretary of the University, Dr. Duncan, junior, and Dr. Duncan refers him back to me as the proper authority to whom application for admission to the Museum should be made. At the same time Captain Brown writes to Principal Baird, and the Principal takes no notice of his letter. Then follow, in the Memorial, a number of other things of no consequence. One passage, however, in a letter here, must strike every one as offensive to me, after what I have done for the Museum.

Name in which letter?—It is in a letter dated 24th April, addressed to me. Some controversy had taken place with Captain Brown and the servants in the Museum; and upon this Captain Brown writes as follows:—"*This shows, in the clearest manner, the improper hands into which the management of the Museum is intrusted.*" Some time before that remark of Captain Brown reached me, I had received from the Town Council a copy of a Report by the Committee on the Natural History Museum; and this paper I lay on the table, to be read to the Commissioners. The last paragraph, it will be seen, goes in opposition to Captain Brown's opinion, expressed in the passage of the letter which I just now read. [*Professor Jameson laid on the table*—"Copy Report by the Committee on the Natural History Museum, 15th January 1827;" and marked, "17th January 1827, approved in Council."] Then follow some other letters in the Memorial. The Captain still is determined not to wait the time appointed, *viz.*, the end of April. He is determined to get into the Museum at his own time, without regard to my resolution, dictated, as already mentioned, by my public duties. Without waiting till the period mentioned, he forthwith addresses the Royal Commissioners. The whole transaction, I remark, freed of the accompanying trifling details, is simply this:—*Captain Brown applies for permission to draw* ALL *the birds in the Museum. I, from the magnitude of the demand, and my urgent official and other duties, cannot take his demand into consideration before the end of April. The Captain, whose time appears to be more precious than that of the Professor of Natural History, insists on forcing his way into the Museum, and taking drawings, before that time; and this attempt is resisted by the Professor of Natural History.*

Are those the only observations you are desirous to make on this Memorial of Captain Brown's?—No, my Lord. I have some remarks to make on the second part of the Memorial. The first part, already discussed, merely refers to Captain Brown's application for the use of the Museum. The second part of the Memorial gives a statement to show that he, Captain Brown, is a person of particular consideration, and therefore, on that ground, entitled to be admitted into the Museum, where admission, it may be remarked, was never refused. It begins—"Your Memorialist hopes it will appear to you, that he has had some forbearance with Professor Jameson in this matter." I would remark here, that, on considering this demand of Captain Brown's, as his drawing was to be on an extensive sale, I came to the resolution, as Regius Keeper of the Museum, to prevent him entering on his plan in view, until the proper authorities should provide me with the means of enabling Captain Brown, or other individuals using the privilege of the Museum, to proceed in a way that may be beneficial to themselves and to Science, at the same time not endanger the safety of the Collection. If individuals are to be authorized to come and demand the Keeper to take out specimens for drawing and describing, he must take them out, if ordered. But at this moment there are no rooms for drawing. It is evident that a *drawing-room* must be provided, into which those having permission for drawing and describing may retire. And, further, if the system of drawing shall be generally admitted, to which I have no objections, there should be a person, or Superintendent, to attend the Drawers; otherwise I could not be answerable for the safety of the Collection, as, from unskilful handling, the specimens might be ruined. Therefore, I repeat, to enable such persons to avail themselves of the permission, a drawing-room ought to be provided, and also a Superintendent to sit by or attend the Drawers.

Those are your observations and objections to such a system?—Yes.

Can specimens not be drawn through the glass?—No. Every specimen must be taken out of its place. It cannot be drawn through the glass.

Are there none that are not in glass?—No.

How do you proceed with the others, besides Captain Brown, who have permission to make

University of Edinburgh.

Professor Jameson.

[27 July 1827.

drawings?—Their demands are few; and, as a personal friend, I can sit beside them while they are drawing, which I could not do to every one.

Is that the amount of the observations you wished to deliver to the Commissioners on Captain Brown's Memorial?—Yes, on this previous part. And I wish it to be understood that I am quite willing to grant every accommodation in my power, in the use of the Museum, for purposes of publication; but, at present, from the limited means of the establishment, I cannot do it with safety to the Collection. In short, until drawing-rooms and additional servants are granted, the permission for drawing and describing must be more and more limited if, as Keeper of the Museum, I am empowered to grant or refuse the use of the Museum for purposes of publication.

Could not a party, wishing to draw, have a table in the window of the great room?—That would not answer. And, besides, I have no person to attend those engaged in drawing.

That is a separate question. But, though there might be some disturbance to the drawer, might not a person wishing to draw be accommodated with a table in the window of the great room?—In answer, I have to mention that the tables at present in the windows, containing articles of Natural History, must be removed. They are all filled; the room is so crowded that a table cannot stand in the room. It is utterly impossible to give accommodation of that kind in the room. The only other place at present is the Class-room, and that I occupy. As the Museum stands at this moment, there is no possibility of giving efficient accommodation.

Have you any other remarks to make?—The second part of the Memorial contains the history of Captain Brown's connexion with the parts of the Collection purchased by the Professors some years ago. He takes great merit to himself as to this Collection. I shall state shortly the history of the transaction. Captain Brown was in London at the time when the Collection was about being purchased. He heard that we wished some one to go to Paris; and he wrote from London, pressing me to allow him to go. The Senatus Academicus intended sending the Janitor Wilson over. Brown being in London, and Wilson, the Janitor, being taken ill, it was agreed Brown should go to Paris, which he did. Captain Brown says the Senatus Academicus relied on his judgment alone in purchasing the Collection. This statement is incorrect. Some time before the Collection was purchased, Mr. Wilson, whom I have formerly mentioned, the brother of Professor Wilson, happened to be in Paris. He knew Mr. Dufresne, the proprietor of the Collection; he made every inquiry, and satisfied me we ought to purchase it. But, not wishing to rely solely on Mr. Wilson's report, I applied also to Dr. Leach, who gave me the same opinion and advice that Mr. Wilson did. Still further, in addition to the reports of those very competent judges, I consulted Baron Cuvier, and Hugo, and other members of the Institute of France. They recommended the Collection in the highest terms. I laid this information before the Senatus Academicus; and they, after considering the reports of these distinguished individuals, authorized me to purchase the Collection.

In point of fact, was the purchase of the Collection concluded till Captain Brown went to Paris?—Captain Brown was sent to Paris in the same line as the Janitor would have been, had he not been taken ill. The purpose of sending him was to compare the articles of the Collection with the catalogue, which Wilson was to have done. If the Collection answered to the catalogue, he was to report to me, and this he did. And then he was authorized, on the part of the Senatus Academicus, to pay a certain sum for it.

Then, in point of fact, it was Captain Brown's Report that led to the conclusion of the purchase of the Collection?—No. The Senatus Academicus had agreed to make the purchase, on the Reports of the gentlemen I have mentioned; and they wished that some one should be sent to Paris, to see that all the articles mentioned in the catalogue were in the Collection.

Are there Minutes of the Senatus Academicus, in which that intention of the Senatus is expressed?—I do not know.

Can you furnish us, then, with the terms of Captain Brown's Report, and of the answer transmitted, either by you or the Senatus Academicus, to Captain Brown, in consequence of his Report?—I am not fully aware of the meaning of the question.

Can you furnish us with a copy of the Report or Reports received from Captain Brown when he was in Paris, and of the answer made by you, or the Senatus Academicus, in consequence of what he reported while he was in Paris?—I dare say I may have the letters by me somewhere. I cannot say, however, positively. But Captain Brown made the purchase in the manner I have mentioned; and, as matter of course, I returned him thanks for what he had done in a letter, the terms of which I shall read, if desired.

When Captain Brown went to Paris, was he authorized by any one to do certain duties there?—I wrote to him.

Have you a copy of the letter you wrote?—I am not sure.

Have you the letter he wrote, with a copy of the Report of his opinion of the Collection?—I cannot say. It is an old transaction, of little moment.

Were the letter and Report not communicated to the Senatus Academicus?—No; as far as I recollect, the whole management of the business being confided to me.

The Senatus Academicus devolved on you the whole management?—Yes.

I think you stated that the whole duty of Captain Brown was to compare the inventory and the articles of the Collection, but that the determination to purchase the Collection was formed in consequence of recommendations of other individuals?—Yes. I stated that the purchase was made in consequence of Reports received from Mr. Wilson, Dr. Leach, and others.

You stated, in a former part of the examination, that you had sent a message to Captain Brown that he had better pay his debts. What are the debts of Captain Brown to which you

alluded, and how came he to be in debt to the establishment?—He had some money of the College when paying for the Collection of Mr. Dufresne. There is a part of it not accounted for. I would not have mentioned that circumstance here if Captain Brown had not brought it forward himself, it being a private transaction, not in any way connected with the Royal Commissioners' inquiries—it is a transaction to be inquired into by the Professors, but not the Senatus Academicus. It is, I repeat, a private transaction.

Is the sum considerable?—£40 or £50, as far as I recollect.

Is it accounted for now by Captain Brown?—No, it is still outstanding.

It is a debt admitted by him?—No, he contests it.

How did he get the money?—It was part of the funds.

How did he get the money?—How he got it, I cannot at this moment say, without reference to the documents.

It was money concerned with defraying the expense of Collection purchased at Paris; but how he got it, you cannot say?—No.

Are we to understand from you, that, besides the price paid to Dufresne, or his representatives, and the other outlays which Captain Brown was at, there is a sum unaccounted for by him to the Senatus Academicus?—Yes.

Who transmitted the money to Captain Brown?—I think it was the Principal; but I forget.

Has Captain Brown exhibited any vouchers of his outlay?—He has; but those vouchers lead to this *deficit*.

This *deficit* appears on the face of his vouchers?—Yes, on the Report of those individuals who examined them at the time.

Was there a man of business appointed by the Senatus Academicus to inspect his accounts and vouchers, and report on them?—There were a few persons examined them. It was done by myself principally; and I remember so much at the moment, that Captain Brown was in debt £40 or £50.

Was it after that *deficit* appeared that he was requested to undertake the charge and management of the Museum?—He never was requested to do that.

Was there no proposal of any sort made to him?—None.

Do you know, upon what ground Captain Brown insists on his not being indebted to the University anything, if, from the face of the vouchers, it appears he is owing £50?—At this time I cannot give a detailed answer. I can only say, there appeared a deficit of a certain amount.

But you do not recollect on what ground Captain Brown refuses to admit the debt?—In short, I had it in view to get the Senatus Academicus to make him a present of it.

Was the Senatus, as well as yourself, dissatisfied with his accounting?—They never inquired after it.

Was no Report made by you to the Senatus Academicus, that this balance is still owing to the Crown?—The general balance was stated.

And Captain Brown's, was it stated?—No, it was not.

In that Report to the Senatus Academicus, Captain Brown's name as a debtor has not appeared?—No, as far as I recollect at present; but I am not prepared to go much into detail as to this £50, or the money affairs of the Dusfresne Collection. It is not to be expected that I should be prepared, without notice, to go into details of this description; and, besides, I consider them as private—between the Professor of Natural History, and a portion—not all the Senatus Academicus.

Did Captain Brown receive any remuneration for his trouble?—No.

Was it, as a species of remuneration for his trouble, you intended to get the Senatus Academicus to make him a present of the sum in question?—I thought so. I knew he was in straitened circumstances, and could not pay it.

But, in point of fact, you were prevented by this discussion from doing that?—[*The witness seemed to assent.*]

Do you desire to make any other remarks on Captain Brown's Memorial?—Captain Brown proceeds to state, that, on his arrival in London, he was detained there to purchase articles for the University, at the sale of Bullock's Museum. That is not the fact. The interesting articles at that sale were purchased by the son of the late Dr. Adam, who transmitted a daily Report of his progress at the sale.

Do you mean to say that Captain Brown made no purchases at all at that sale?—He made purchases, but for himself; he made none, by my orders, for the Museum.

He made none for the Museum?—None that I know of. I believe he purchased some shells for his own Collection. The next is a statement I have also to notice. Captain Brown says, he was requested by me to draw up a plan for the management of the Museum, which he did, and was ultimately offered the superintendence of it, which he refused, in consequence of duties being required of him which no gentleman could consistently perform. I would remark here, that the Captain, always full of schemes, offered to draw up a plan for the management of the Museum; and I dare say he did draw up a plan, though I told him none was wanted. I believe he did draw up a plan for the management, but without any request from me. On the contrary, I opposed it, telling him the thing was absurd. Captain Brown then says, he was offered the Superintendence of the Museum. That I also deny.

Was there no offer at all of that description made to Captain Brown?—No. He was in the practice of going among the Professors, some of whom may have said to him he might apply for the situation; but of this I knew nothing.

University of Edinburgh.

Professor Jameson.

27 July 1827.

Do you happen to know if the Principal made a regular proposal to him as to the superintendence?—If he did, it was never intimated to me.

Have you any reason to suppose that the Principal did make any proposal to Captain Brown on the subject?—I should think not, as otherwise he would have mentioned it to me.

You may go on with any other remarks you have to make?—Captain Brown says, he has, ever since the period of the proposal, been refused admission to the Museum. That I also deny: he never was refused admission.

In part of your former evidence, you state, you had refused him. There occur this question and answer:—"Are there any instances of persons connected with publications being refused permission to draw?—There was one lately. Captain Brown applied, and I refused his application, knowing that he was not fitted for writing nor for drawing, so as to reflect credit on the University. Considering my power, and what at present I hold to be my duty, I refused him permission to make drawings that were to be published. Had it been for his improvement, I would not have refused; but, considering the reputation of the Establishment concerned, I refused him the permission. And further, independent of the considerations already stated, I found it impossible, from want of accommodation in room and money, to grant the necessary accommodation for the purpose."—Captain Brown was *never refused admission to the Museum*, but was not allowed to make drawings.

Then, at what period did you begin to refuse Captain Brown admission?—At the time this controversy took place between us.

Then, your refusing the permission was the consequence of the controversy?—In part; and I cannot say it was a distinct refusal. He was allowed to enter the room, but, for reasons already stated, he was not allowed to make drawings, until I had time to consider his plan; I refused him permission to draw.

Had he been in the practice of drawing before?—Never. Next, Captain Brown gave in a long proposal, by a letter to Principal Baird, a letter to the Secretary of the University, and a letter to myself, offering to take charge of the Museum *gratis*. This proposal, I knew, was absurd. From pecuniary circumstances, it was obvious that he could not, in justice to himself and family, execute—allowing that he was qualified for it—the office of Keeper; and yet he offers to spend his whole time on the Museum, without remuneration. Therefore, no notice was taken, by any of us, of his letter. When I reasoned with Captain Brown on the subject, he said it was an affair of his alone to look after,—that Lord Douglas, Colonel Douglas, and Lord Melville, would procure him a salary of £200 a-year, if I would allow him to be appointed. Knowing the absurdity of the proposal, I would not listen to his plan. Captain Brown goes on to say—"If your Memorialist was considered by the Senatus and Professor Jameson, a fit person to perform all those duties eight years ago, he must certainly be better qualified now," &c. He was not considered so by any of us; and we paid no attention to his absurd proposal of becoming *gratis* Keeper of the Museum. Captain Brown states, that this Museum ought to be open to the Public—that it is a Public Collection,—and that every subject of the Empire is entitled to enter it. This is an erroneous view of the nature of the College Museum. It is an Academic Museum, not intended for the Public, though of late the Public have been allowed to see it. It is intended for the instruction of Students in the University; and, though a small Collection, it has done much for Natural History.

You state, you consider this Museum to be an Academic Institution, for the benefit of Students of the University?—Principally.

Have the goodness to state, what Students have the use of the Museum, and in what manner they have the use of it?—The Students of Natural History have the use of the Museum.

Supposing a person has studied Natural History at another University, and is attending the Chemistry class at this University, has he the use of the Museum?—No case of that kind has ever occurred; I think he might be admitted.

Are the Students attending any other Class than that of Natural History enabled to get admission to the Museum, otherwise than by paying 2*s*. 6*d*. at the door?—Not at present. After some experience, it appears that the regulation may be modified by the Commissioners.

Do the regulations of the Commissioners for the College Buildings state, that only Students of the Natural History Class shall have the use of the Museum?—Yes, in so far as regards the gentlemen attending classes in the University.

I think you formerly promised to furnish us with a copy of the Regulations?—It had escaped my memory. I shall now make a memorandum as to this.

Supposing a student at the class of Chemistry were to apply for an annual ticket for admission to the Museum, would his application be successful?—That has never been put to me.

Supposing an individual has finished his instruction at Edinburgh College, and is living here, what access has he to the Museum?—He has access by paying 2*s*. 6*d*.

Must he pay 2*s*. 6*d*. every time he goes to it?—Every time he goes to the Museum.

On what conditions, and to whom are annual tickets granted?—They are granted to students of Natural History—to ladies—to those anxious to continue their Natural History pursuits. Free, or gratis tickets of admission are granted to distinguished individuals, during their residence in Edinburgh.

Then, other students at this University have not the benefit of access to the Museum?—They have not,—on the same principle as the Botanic garden is not open to other students than those attending the Botany class.

Does that annual ticket, or does the admission on paying 2*s*. 6*d*. entitle individuals to draw in the Museum—to make such drawings as they can, without specimens being taken out for them?—The regulation which is the same as in all other Museums is, that no one entering

,503

University of Edinburgh.

Professor Jameson.

27 July 1827.

the rooms is entitled to draw, without permission from the person having superintendence of the Museum. A placard was formerly put up in the Museum for the purpose of intimating that regulation, which is now taken down.

Supposing a person paying 2*s.* 6*d.* enters the Museum, and wishes to make drawings for any publication he happens to be engaged in, without asking the permission of the keeper, is he not permitted to draw?—He is not permitted.

Are you aware that persons have been turned out of the Museum for attempting that?—I have no recollection of such a transaction. I firmly believe that no one was ever turned out of the College Museum on such a pretext. I have at times, twice or thrice, questioned those employed in taking drawings, but never prevented their proceeding with them.

Do you happen to know, that an individual, attempting to draw the Fossil Elk, was prevented from finishing it?—I have no recollection of that; I do not believe this ever took place.

You mentioned, in your former evidence, that a considerable proportion of the articles in the Museum are private property?—I should wish to explain as to that.

Have you any catalogue of those articles, or do you know how they came into the possession of the Museum?—The French collection is private property. The Professors are individually bound to pay for it. I pay the interest of £3,000, which it cost. Bills are signed by the Principal, Secretary, and myself, to the Banks. Many of the Professors are bound for the collection, until some means are obtained for paying the purchase-money to the Banks.

I observe the interest is paid out of the receipts or sale of tickets?—Yes.

The right of property, which I understand you to ascribe to the Professors, arises from the fact that they individually have undertaken to be liable to the Banks for repayment of the money, if it should be demanded?—Yes.

The right arises solely from that fact?—Yes, solely.

You do not understand that, if Government was to repay the money, the Professors could refuse to allow the specimens to remain in the Museum?—They would, I dare say, be very happy if Government would pay the purchase-money.

But, if they could get a profit from another Museum, for instance, could they withdraw the collection from this Museum?—I should think so. I should think that it is so much their private property, that they can dispose of it as they might think proper.

Could they, in your opinion, withdraw it now, and sell it to any public body?—I should think so.

You conceive that it is entirely the property of those individuals?—Yes.

At the time those Banks undertook to advance the money, was it explained to them that it was to be for the purpose of purchasing the collection, to be the private property of the Professors, or to be the property of the University?—To be the property of individual Professors.

That was the condition on which the transaction was entered into?—Yes.

Are other private persons concerned in the property of the collections in the Museum?—The Town-council claims a certain part of the Museum as their property. This is the Town's Museum, properly so called. There is another collection, which was left by Dr. Thomson, of Naples, to the Provost and Magistrates of Edinburgh. And there are some other collections under the same circumstances, generally speaking.

Is there any inventory, distinguishing the different individuals or bodies to whom those collections or particular items belong?—There is a catalogue in possession of the Barons of Exchequer, of the Royal collection. All the articles belonging to it are there recorded. For instance, the presents sent down by Lord Melville, presents from Governments abroad; all those are considered the King's property, forming part of the Royal Museum. Those arrivals are reported every year to Exchequer.

But, is there in Exchequer, or anywhere else, a regular catalogue, describing what belongs to different parties—to individuals, or to the King?—I cannot answer that question satisfactorily at present. There is a catalogue in progress, which is to be printed. It is a work of labour; and in that catalogue, the history of each donation is to be given.

Then, that catalogue will specify to whom every article belongs?—We can get at the history of most of the articles, by referring to a ledger which has been kept for many years. When an article arrives, it is entered in the books, specifying from whom it comes, and everything regarding it.

But, do you consider everything that comes direct to the Museum from an individual continues to belong to him?—There is at present in the Exchequer a discussion on that head. I maintain, that every article addressed to the "Royal Museum," becomes the property of the King. There is some doubt about that. I differ from the Barons of Exchequer in their views on the subject. I think, when an article is addressed to the "Royal Museum," it becomes the property of the Crown; therefore, I consider many articles to be Royal property, as to which at present doubts are entertained. Many articles come to me, which I know were intended to be considered as my own by those who sent them, former pupils and others; but I give them over to the Royal Museum, because addressed to me at the "Royal Museum."

Are we to understand, that the Barons of Exchequer conceive those specimens so sent are rather deposits than gifts?—Suppose an object arrives addressed "Royal Museum, care of Professor Jameson," I say this object, having the mark or address of "Royal Museum," is not the property of the individual, but of the Crown. But the Barons think otherwise.

Are you now referring to a discussion as to a claim made by the Royal Society?—Yes.

Is the result of that interpretation to secure the articles to the University Museum, and to exclude the claim of the Royal Society?—That is another discussion altogether.

University of Edinburgh.

Professor Jameson.

27 July 1827.

Does this discussion in Exchequer relate to a claim by the Royal Society?—It must be connected with that. I have contested that claim of the Royal Society.

Is that the nature of the claim now in Exchequer?—Yes, to a certain extent.

Then the result of the interpretation which the Barons of Exchequer put on the claim is, that the articles are secured for the University Museum, and the Royal Society is excluded?—No.

As we understand the matter, the Barons say the articles belong to you, the Professor of Natural History, as keeper of the Museum; and you, when you receive them, say they belong to the Royal Museum in the University; and that is, to the effect of excluding the Royal Society; you hold them to belong to the Royal Museum in the University?—Yes.

Then is the interpretation of the words "Royal Museum," to which this discussion relates, in reality a question between the Royal Museum of the Royal Society, and the Royal Museum connected with the University?—I believe it is in some degree.

Is there any decision of the Barons of Exchequer on the subject?—They have given a temporary Return. I maintain there is but one Royal Museum in Scotland—that whatever comes addressed "Royal Museum," is for the Royal Museum of the University. There is no other bearing that name in Scotland.

Particularly if the article be addressed to your care?—And although that be omitted, there is no other Royal Museum here than that of the University.

To whom do you consider the property of any articles to belong, which were transmitted under the regulations of Lord Londonderry—under the regulations which were introduced under authority of Lord Londonderry's letter, dated at the Colonial Office, 14th May 1807?—You are alluding to the old letter. That arrangement has been modified since. At present the understanding is, as understood by Lord Melville, that all articles sent from public offices are to be considered Royal property. Thus, all articles from Captain Parry's Expedition, Denham's Expedition, &c., are Royal property. As such, they are reported every year to the Barons of Exchequer. *All articles collected at the public expense are considered Royal property, and belong to the Royal Museum.*

But a variety of specimens, it is understood, are sent home, under the benefit of the regulations which were originally introduced under authority of Lord Londonderry's letter—articles which have certain privileges at the Custom-house, and which are transmitted under authority of those regulations: to whom do those objects belong?—Those belong to the Royal Museum; and, according to the Barons of Exchequer, if addressed privately, they belong to private individuals. I, as formerly stated, consider the subject otherwise.

Are any of the articles in the Museum the private property of yourself?—Yes.

Did any of those articles come under the protection of the regulations so established under authority of Lord Londonderry's letter?—A great many came to me from my Pupils; but having "Royal Museum" marked in the address on them, I instantly gave them over to the Royal Museum. But if this decision of the Barons holds, I would be entitled to claim them back.

But, did any of the articles you claim come under the benefit of those regulations, and with advantages at the Custom House?—None. The collections of my own, I have either collected myself in different parts of the world, or have received from Pupils, through unprivileged channels.

And were none of them received by you, in that manner, through the Custom-House?—None.

And, were those you consider your own, entered as such in the ledger you mentioned?—They are not regularly; and, were I to die just now, they could be properly taken as public property.

I think you stated, a short time ago, that a Catalogue has been some time in progress, making distinctions as to property, as appearing from the ledger?—Yes.

Then, if a great many of the articles in the Museum are your property, and not entered in the ledger, what is the evidence to show what is your private property, and what is the public property?—The only evidence is myself, private letters, and catalogues; and that is one reason for getting through that Catalogue.

Do you know, what are the whole of the Collections you have in the Museum?—I know those portions that belong to me.

But how do those portions appear?—From my own declaration, private letters, and catalogues. All articles not belonging to the Town, to the Crown, to Dr. Hutton, or to the Professors, I might say, are my own by exclusion.

But, how do you make out those which belong to the others you specify, if you cannot bring evidence that they do so belong to them?—I have been very careful as to public property, but careless as to my own. It is not my intention to remove my own articles from the Museum; they shall remain there for good: such is my present intention.

Do you understand that the Barons of Exchequer hold you are entitled, as an individual, to occupy with your private property, buildings belonging to the public?—This view, I dare say, has not been taken up by the Barons of the Exchequer. They, I should think, will be disposed to encourage every display of Specimens, whether, public or private, which is to benefit the Establishment. I have certainly no right, rigidly speaking, to occupy any part of the public buildings with articles of my own property.

But may not the circumstance of such articles being seen there prevent similar ones being sent, which would become public property?—Most of the articles of private property exhibited, are too valuable to be made presents of.

In making out that Catalogue, is it to be understood, that all those articles which, by ex-

5025

University of Edinburgh.

Professor Jameson.

27 July 1827.

clusion, you can distinguish as your own, are marked in the Catalogue as yours?—Yes. But I have otherwise many letters and catalogues to authenticate them as my property. I can establish the articles to be mine by different written documents.

Independent of this collection of Dufresne's, and of what you consider to belong to the Town, and to the Crown, and Public Museum of the University, what proportion of the Museum do you consider to be in this situation, subject to your claim of private property?—I am not ready to answer that question.

May it be a half?—No.

Then, may it be a tenth?—I would be speaking at random, if I answered.

When articles are transmitted to the Museum, do you take the opinion of the Principal or others, to assist you to decide as to the right of property?—No. When donations large and valuable are received, I request the Principal to obtain the thanks of the University for them.

But, when objects are received at the University, and a question may arise, whether they may belong to you, or to the Museum; do you ask the Principal or Professors to decide that question?—I do not consider it necessary; because I consider the address "Royal Museum" makes the article received public property.

Then, it is to be understood, that the confusion which on your death may arise, supposing your friends to claim, arises from your sending articles from your private Repositories to the public buildings?—Yes, to a certain extent.

Are there any other persons have any right in regard to the Museum?—I think not. The Royal Society had, at one time, right to the Huttonian Collection. They had that right under their old Charter. I am not sure they have that in the new Charter they have got. That being the case, I have hesitation in acquiescing in the desire of the Royal Society on the subject, till the terms of the new Charter be explained in a legal manner to my satisfaction.

Have you had an opportunity of seeing a Petition to the Royal Commissioners from the Royal Society?—Yes.

Have you seen the Donation, in the letter from Dr. Black, of the Huttonian Collection, to the Royal Society?—I may have seen it.

As the new Charter empowers the Royal Society to claim the Collection for itself, which the old Charter prevented them from doing, state in what manner you think that that clause can deprive the Royal Society of the property of the Huttonian Collection, which was deposited in the Museum, under the condition that the Members of the Royal Society should have access to the Collection?—I have no opinion on the subject. I do not know whether I would be right to allow the use of that Collection to the Royal Society. If it be proper to be done, I would be happy to accommodate them, when the means of doing it are provided. Some time ago, application was made by Captain Duff, for admission to the Huttonian Collection. I answered, that the request would be considered, having in my mind, at the time, reference to the meaning of the new Charter. Under the old Charter, the Collection was shown frequently to Members of the Royal Society. But, I was told by some one, that, under the new Charter, this could not be demanded.

Is there any clause in the new Charter to show this?—I have been told so, and I intended consulting you (*Mr. Solicitor-General*), and others on the subject.

You do not know what its provisions are?—No.

We observe, since 1811 downwards, there has been discussion between the Royal Society and you, and their applications have been refused?—Yes, on the ground of the difficulty. I have been advised by the Professors to have the thing explained, before making any arrangement. But those Gentlemen who wished have seen the Collection. At present, however, there is no accommodation; and, for some years past, the Collection has been in a garret, or spare-room, and cannot be seen.

Supposing some part of the private property were removed from the Museum, room could be made for that Collection?—I am not disposed to adopt such an arrangement. Were it adopted, all the Members of the Royal Society would probably have a right to come into the Museum; and I am very anxious to get 2*s.* 6*d.* from each of them, when they come there.

But, how is the Huttonian Collection placed there, if the Members of the Royal Society are not to get access to it?—They get access.

But, at present, it is not exhibited?—Not at present.

When you say it has been several times seen, you mean the boxes have been shown?—I have shown it to strangers and others privately.

By privately seeing, we collect, you mean in a separate apartment?—Yes. I am very anxious that that Collection, being connected with the history of the Royal Society, should be given over to them. The Members taking an interest in the Huttonian Collection, it would be well to do it.

The clause in the Charter of the Royal Society states the intention of the Crown, that the Collection in the Museum of the University shall be open to the Members of the Royal Society; have the goodness to state whether you allow access to Members of the Royal Society, and under what regulations?—None of them have applied, not being aware they have any title.

To what does the correspondence, from 1811 downwards, relate, then?—To claims the same as the claims of the Royal Society of Surgeons. No applications have been made by individual members.

In point of fact, have members of the Society access or not?—They have not to the Museum generally,—that is, to the College Museum.

Captain Duff's application was in regard to the Huttonian Collection, and other objects belonging to the Royal Society?—Yes, in regard to the Huttonian Collection, or Huttonian Museum.

University of Edinburgh.

Professor Jameson.

27 July 1827.

Have no steps been taken, with a view to accommodate this matter, by reference to Counsel for opinion?—It was my intention, having got this communication from the Royal Society, to have consulted with the Solicitor-General.

Has it not been a difference of opinion of some standing?—No; only a short time—some months.

This Museum never can be shown, then?—Not until we have more accommodation.

Is it chiefly a Collection of Minerals?—Yes; and, in truth, it is not worth house-room; but, being the collection of so distinguished an individual, it excites an interest on that account.

You have, I presume, a copy of the Donation by the Society of that Collection to the Museum; or, did you consider it came to the Museum, as matter of legal necessity, under the terms of their Charter?—I should think so.

The terms of the Charter direct, that they shall be deposited in the Museum of the University?—The Museum in the University contains many rooms. I am not bound to place them but where I find convenient, in any room in the Museum; and I am not disposed to allow members of the Royal Society to get into the Museum, without paying half-a-crown.

But the clause states, as the countervailing advantage and object in depositing the Collection in the Museum, that the Museum shall be open to the Members of the Society?—This may be the case, but I think at present otherwise.

Then the University get the Collection, and exclude the Members of the Royal Society, the University thus disregarding even the terms on which they got the Collection?—The Members of the Royal Society are not excluded from the Huttonian Collection, but from the Museum. Legal men differ in opinion as to the meaning of the terms; I think the clause applies exclusively to the seeing of the Huttonian Museum.

Did you obtain any opinion to that effect, from lawyers?—Merely in conversation.

Had those gentlemen read the Charter?—Yes.

With reference to this particular point?—Yes.

Do you apply the same interpretation as to the Library of the Faculty of Advocates, if they avail themselves of books and manuscripts belonging to the Royal Society, and in that way would only show what they obtained from the Royal Society to any of its Members?—I cannot go into legal points. At this moment, I am anxious to get money in any quarter—from the Royal Society Members, as well as from others. The Museum Fund is very low—is getting lower; and therefore I must look around me for means for its support, in every legal and proper way.

Edinburgh, Thursday, 18th October 1827.

The SOLICITOR-GENERAL in the Chair.

[There was not a Quorum of the Commissioners present at the following Examinations, *viz.* from Dr. Gordon's to Professor Napier's inclusive. Their Evidence was reported to the Commissioners on 27th current, and ordered to be printed.]

The Rev. *Robert Gordon,* D.D., one of the Ministers of the City of Edinburgh, called in and examined.

Rev. R. Gordon.

18 October 1827.

The Commissioners are desirous to have the benefit of the result of your experience and observations on some points respecting the Course of Education in the Scotch Universities. They understand that your attendance as a student was at Aberdeen?—As a student of Theology only; I studied Philosophy at Edinburgh.

In the course of your attendance at Aberdeen, it is presumed you acquired some information as to the general circumstances of the students, both of Theology and of Philosophy?—Not so much of the Philosophy students; I had very little connection with them, and had very little acquaintance among them; I know the general outline of their system.

But with the circumstances of the students of Theology you had occasion to be acquainted?—I had a good deal to do with them, and I know pretty well how that department is conducted. The Session is very short compared with the ordinary Session of the Theological Course in other Universities. I think it opens some time about the end of December or the beginning of January, and it closes about the end of March. I got a certificate as a regular student for two Sessions, though I did not enter till about the last day of December, or the beginning of January, and left it again about the last week in March.

Do you think that the prolongation of the Session of Divinity in Aberdeen would be felt to be a serious inconvenience to the students in general?—I suppose it would be felt a great inconvenience to the class of students that attended during the time I was a student there; for I believe, generally speaking, they were in poor circumstances. A great proportion of them had parish schools, or some similar situations; so that the shorter the Session was, the more easily they could find a substitute for the time they were absent, and the less expense they incurred themselves.

So far as you were able to learn, did it appear to you that their circumstances were worse than those of students attending the Divinity Hall, at Edinburgh?*—It struck me that the

* *Note on revising Evidence.*—Witness understood the question to be, Whether the Students of *Divinity* in Aberdeen appeared to be in worse circumstances, as to pecuniary matters, than Students *generally* attending Edinburgh?—Witness never was in the Divinity Hall at Edinburgh, and could not therefore compare the two Halls. Yet, from what he had an opportunity of observing, he was led to believe that the Divinity Students in Aberdeen were inferior, in point of worldly circumstances, even to the same class of Students in Edinburgh. It may be proper to add, however, that many of the Students of Divinity at Aberdeen were from remote districts of the Highlands, where their opportunities of knowing the world must have been very limited. Witness therefore may have received, from their general appearance and manners, a more unfavourable impression respecting their worldly circumstances than was consistent with the fact.

587

University of Edinburgh.

Rev. R. Gordon.

18 October 1827.

great mass of the Divinity students were very inferior, in worldly circumstances, to the general body of students here. That, of course, is more an impression than a knowledge of facts. I knew some of them, however, very intimately, and I know that to be the matter of fact with regard to them; and the general impression which I had of the Hall, was decidedly what I have stated.

Have you any means of ascertaining what was the average expense of maintenance of the students in the Divinity Hall?—I do not think I could answer that question with any precision.

Is it your opinion, then, upon the whole, that an extension of the Session would not be expedient with reference to the interests of the students?—With reference to the interests of the Church, I think it would be expedient; because I think it would shut out a great many who certainly ought never to have been in the Divinity Hall—persons whose previous acquirements were not such as to do justice to the Church of Scotland, and who, I believe, never would have thought of entering the Divinity Hall, if they could not have got through it so easily as they did.

And whose attainments were not such as were likely to ensure their preferment in the Church afterwards?—I do not think they were such.

Do you believe that the result of the footing on which the Divinity Hall was at Aberdeen, has been to introduce into the Church a number of young men, who are afterwards, as preachers, scattered about the country, without much chance of preferment, and who do not tend much to raise the character of the Church of Scotland?—I have reason to believe that a great many of those that studied at Aberdeen, were in those circumstances, and that they never had any rational prospect at all. As a proof of that, many studied both Medicine and Divinity, in order to have two strings to their bow, as they expressed it; and I know that a great number of them got parish schools and various other employments, and continued in them.

Without having taken a licence as Preachers?—Most of them have taken a licence; they all seemed to have a desire for a licence.

In the case of those that studied Medicine as well as Theology, would there have been any inconvenience in their attending a Course of at least five months?—The class that studied Medicine, could easily have attended a five months' course.

Did it appear to you that those in general that were understood to have schools in the country, were capable of conducting those schools so as to promote the interests of education?—I should have doubted it; that is to say, I should like to see the parish Schoolmasters of Scotland superior to the larger class of the young men I speak of. They were better, certainly, than many of the old Teachers, who were quite incapable of teaching the very elements of Latin and Greek; but still their qualifications did not appear to me, as far as I had an opportunity of judging, to be equal to what I should think those of a parochial Schoolmaster ought to be. The Professor of Divinity in Marischal College made the students read, in succession, from the desk, a portion of an English work once a-week, with the view of improving their elocution; and it was but too evident that in many cases their education had been very defective.

Do you think that all the advantages to be expected from regular attendance in the Divinity Hall, such as the use of books, as well as the information derived from lectures, can be expected to be nearly as well secured in a Session of three months as in a Session of six months?—No, I do not think so. I can see no reason why there should be any relaxation of the law of attendance in the case of those studying Divinity; I think it has been productive of the very worst consequences, not merely with regard to the individuals who may avail themselves of the privilege of not attending, but with regard to the general feeling it has generated among the students of Divinity; for I am persuaded, and I speak from my own experience, and from an intimate acquaintance with young men who, I know, felt as I did, that it produces a sort of feeling as if the thing were not essential—as if it might be dispensed with; whereas the idea never entered our head, in passing through the Philosophy Course, that any part of it could be dispensed with. I beg to remark, too, that the Exercises prescribed in the Divinity Hall are not at all like the Exercises that ought to be prescribed. They do not arise out of the business of the class; they are certain things, *opera operanda*, which they know they must do; but they get through them by any sort of shift, though it be even borrowing from one another, which, I know, was very often the case, particularly in the Exegesis; whereas, in all the other classes, they have Exercises prescribed to them, arising out of the business of the class, which awaken an interest in the young men's minds, just because they refer to the subject with which they are every day more immediately conversant. I conceive, therefore, that there ought to be presented to the students of Divinity a number of Exercises connected with the business of the class, at the option of the Professor, and according to his judgment, independently of the five Exercises which the law of the Church requires; and this, I think, cannot be accomplished but by regular attendance.

Are the Commissioners to understand that it is the result of your observation at Aberdeen, that the state of the Divinity Hall there has been prejudicial to the interests of the Church, by introducing into the Church, as Preachers, a great number of individuals who, you think, ought never to have been students of Divinity?—I cannot tell how far the shortness of the Session, and the system altogether, may have contributed to that. Perhaps I ought to be a little guarded in giving an opinion upon that subject, because I may be overrating the influence of that circumstance; but my impression, and that of others who were in the Hall when I attended, is what I now state.

And for all those that you think it is desirable should be retained for the service of the Ministry, you consider that the extension of the Session would not be inexpedient?—I think it would not.

University of Edinburgh.

Rev. R. Gordon.

18 October 1827.

You stated that a number of those who had obtained licences as Preachers, had resorted to other employments than those even of Schoolmasters. Were those employments shifts for the purpose of supporting themselves, and not such as were at all likely to raise, in the estimation of the people, the character of Preachers?—I know several, for example, who went into the Army; some who became Medical men and practised—some of them also in the Army, and others in country situations. A vast proportion of them, however, became Teachers, in one shape or other. I have referred to the case of those who studied Medicine with the view of ultimately practising, in the event of their prospects in the Church failing, as a proof of the feeling which existed in the minds of many, that Theology was but a secondary concern, to which it was not necessary to give more than a fragment of their time.

So that, in point of fact, if a considerable proportion of those had not originally attended the Divinity Hall, the Church would not have lost any member whom it was desirable that it should retain?—I think not.

Have you formed any opinion with regard to the expediency of exacting fees from students of Divinity?—I have often thought that it would be for the interest of the study of Theology, as a Science, that fees were exacted; and just for the same reason that I would have them bound to attend regularly,—that the circumstance of there being no fee paid, produces that kind of feeling in the minds of the young men, that the subject is of an inferior cast to the other branches of Science taught in the College: and I think, moreover, that young men are exempted from paying fees just at that period when they come to be better able to pay them than at any other; at least, if I may speak from my own experience.

Do you think there ought to be regular Examinations of the students of Divinity, during their attendance in the Divinity Hall?—Decidedly.

What would you propose as a complete Course of attendance at the Divinity Hall; how many years, and embracing what Classes, for the study of Theology in all its departments?—I should consider perhaps three years' regular attendance, provided there were in each University two distinct Professors of Divinity—a Professor of Dogmatic Theology, and a Professor of Biblical Criticism. The latter, I think, is a great desideratum in most of the Colleges that I have had occasion to know anything about; and I speak the more confidently upon the subject, from having spent two Sessions under a Professor who made himself almost entirely a Professor of Biblical Criticism: I mean the late Dr. Gerrard, of King's College, Aberdeen. Though I did not receive so much improvement from it as I might have done, I received this impression very strongly, that it was a most essential part of a course of Theology; and I see no reason why a student should not attend both Professors of Theology in one session, just as he attends two classes of Philosophy in one session. I should, however, modify my answer, by saying, that if there is not a separate Professor of Biblical Criticism, I think the course would require to be extended.

What would you think a reasonable duration for the Session?—I see no reason why it should be shorter than the other Philosophy classes: from five to six months.

You attended, it is presumed, the Professor of Theology, both in King's College and Marischal College?—In both.

What is your opinion as to the expediency of that system of double instruction?—As the University stood, when I attended at Aberdeen, I thought it of great advantage; because, while we got the system of Theology in one College, we were getting Biblical Criticism in the other; and we might have benefited from both Professors, as well as if we had been confined to one. We had plenty of time for prosecuting both studies, and they were so distinct, that our attention was kept alive to both the Courses; we did not get a repetition in one Hall of what we heard in the other.

Unless there is some such division of subjects between the two Professors, either by accident or by concert, is it your opinion that it is a good system?—No; I thought it good in that case, because it so happened that the Professors took two different subjects.

You say you think it would be an advantage for the study of Theology in that University, if there was one Divinity Hall, with two Professors attached to it, having their departments distinctly defined?—I think it would be a great improvement certainly. I have understood that there is no necessity for a student of Divinity in Aberdeen attending both Halls; I always understood that I might have attended either Hall that I chose, and demanded my Certificate at the end, as having finished the Theological Course.

Did they lecture only on alternate days?—Only on alternate days.

Do you think it would be preferable, if they were each to lecture every day?—It would be difficult, perhaps, for the students to attend in that case, on account of the distance, for one thing.

Would that operate, in your mind, as a reason for an Union of the Colleges, at least so far as the study of Theology is concerned?—Yes, or their entire separation.

Does anything occur to you which you wish to suggest to the Commissioners?—I would only beg leave to repeat, that the low state in which I fear Theological Literature is at this moment in Scotland, has arisen, I am persuaded, in a great measure, from the present law dispensing with the necessity of oral instruction, and thereby virtually placing it on a different footing from any other department of an Academical Course; and that one of the first things to be done, in order to improve our Theological School, is to enforce regular attendance, and, at the same time, to provide means for teaching more of the Literature of Theology than at present exists in our Colleges. The students, I think, should be subjected to frequent Examinations during their Course, and be given to understand, that their Certificates, at the end, should be a faithful representation of their progress in the different departments of Theological Literature, and not merely an attestation that they attended so many days, and read so many discourses.

5809

University of Edinburgh.

Rev. R. Gordon.

18 October 1827.

With regard to their attendance upon the Hebrew Class, for how long a period do you think that should be?—Two years, at the very least, meeting every day; for I am persuaded, with respect to the Hebrew class, that the great question with a vast number of young men has been, not how much Hebrew Literature can I acquire, but, with how little can I get through?

Do you think that the Professor should commence by teaching the Elements, or do you think those should be acquired by the young men before they enter the Divinity Hall?—I think it would be desirable if the Hebrew Class were attended at an earlier period altogether, that is to say, not among the Theological Classes, but among the Classes in the early part of the Curriculum; so that, at a more advanced period, the Professor of Hebrew should be more a Professor of Biblical Criticism. I believe many have been deterred from prosecuting the study of Hebrew Literature, by the irksomeness of acquiring the Elements of a Language at so late a period of life as that at which young men generally enter the Hall.

So as to have two Classes of Hebrew?—Yes.

Do you conceive that the Preparatory Course should be extended beyond four years?—I think it might be comprehended within four years; and that those that entered for the Church, might be obliged to attend the Hebrew Class before they studied Divinity at all; still, not to extend the Philosophy Course. I know there are some of the Sessions, in the more advanced part of the Philosophy Course, where the young men have not so much to do as they could do. In the Moral Philosophy Session, for instance, many, I am persuaded, trifle away a good deal of time, from their not being subjected to such a system of tasks and exercises, as they have at an earlier period, when they attend the Latin and Greek Classes.

Do you think that sufficient provision is made for the preparatory studies in Literature and Philosophy, before entering the Divinity Hall, or would you suggest any improvement in that respect?—There has nothing occurred to me farther than making the Hebrew part of that Course.

Do you think it essential to have Examinations in all those Classes?—I think so, decidedly, in every Class; I think it is quite essential to teaching.

Can you state whether, from your observation of the students of Philosophy at King's College and Marischal College, you think that an extension of the Session in those Colleges would be a material hardship to them?—I do not know whether it is not about the same length, at present, with the other Colleges; those Classes open much earlier than the Divinity Classes; but I was so little acquainted with the Philosophy Course in Aberdeen, that I can hardly give an opinion about any change in that respect.

The Rev. *James Gordon* called in and examined.

Rev. J. Gordon.

Did you study Philosophy at Marischal College, Aberdeen?—Yes.

During a Course of four years?—Yes.

Did it appear to you that the Session of the College was sufficiently long, or did you think that it might have been extended, without any material inconvenience or hardship to the students?—I think it would have been an advantage to them to have extended it to six months, particularly the two Classes of Philosophy; because there would have been more time to have finished them with advantage. In the Moral Philosophy Class, there was a very considerable proportion of the matter of that Class upon Political Economy, which was obliged to be skimmed over hastily, and no time given for examining or for dictating upon those topics; which, if there had been more time, would have enabled them to finish it with great advantage. The only difficulty that I apprehend in lengthening the Session, is with respect to those who are engaged in teaching Schools; but that would be the same in any other University; it would only bear hard upon them in the way of lengthening the time that they would be away from their schools.

Do you think that those who contrive to obtain the means of subsisting for five months, could have contrived to have found the means for another month?—Yes, at a little more expense to themselves.

Do your experience and observation enable you to say, whether many of the Students attending that College were in difficult circumstances, or otherwise?—I do not apprehend that they were in difficult circumstances, unless it may have been a very few of them; and there were a considerable number of Bursaries that tended to alleviate that difficulty, in the case of those who gained anything in that way.

Can you state what you believe to have been the average expense of living among the Students in your time?—I can only state that, in so far as I found it myself. The last Session I was there, the expense was somewhat increased, owing to the articles of life being more advanced, and the fees were rather increased. There was a considerable interval between my first year and my last: the first year I found that about £15, or a little more, would do, including the fees; but the latter year it would require £20, or more.

You were grown up by that time?—Yes.

Do you not think that there were some who lived at less expense than what you have now stated?—I hardly think they could have lived at less than I mentioned for the first year, unless they had the assistance of a Bursary.

Did you study Theology at Aberdeen at all?—I attended Dr. Brown while I was attending the Moral Philosophy class; I was allowed that as a favour: but I could not have attended at Old Aberdeen; the hours would not have allowed it.

Did you think the Theological Session sufficiently long?—No, I thought it too short; were one to attend regularly, the one at St. Andrews is short enough.

Do you believe, that if the Divinity Session at Aberdeen were prolonged, it would be com-

University of Edinburgh.

Rev. J. Gordon.

18 October 1827.

plained of as a grievance or a hardship by the Students in general?—I do not think it would, except as being an alteration; but there would be no objection if that had been the practice; and that it would be a benefit, I am convinced.

Can you state whether, among those with whom you were acquainted, there was any general impression, that the Session might be beneficially lengthened?—I cannot say that I could judge from that, for I believe it was never a topic of discussion among us.

Is it your opinion that any proportion of those whom you would wish to see enter the Church, would have been excluded, if the Session had been prolonged?—No, I do not think an additional month would have had any effect of that kind.

Did you attend any other University, for the study of Theology, besides St. Andrews?—Only one Session; I attended here for the purpose of seeing the mode of conducting matters here, and to get acquainted with some of the Clergy.

Was that a regular, or a partial Session?—It was a partial Session; I was obliged to attend them all in that way, unless the law had required it otherwise.

Did you attend six partial Sessions in all?—Yes, six partial Sessions.

Was it your own belief, that it would have been much more advantageous to you, if circumstances had permitted your regular attendance?—Yes, I would have found great advantage from devoting my time to study. I did read at home, but I would have found it a great advantage to have been near a Library, and to have had the Professors at hand to consult, and to get their advice and direction at the same time.

Do you conceive that you were fully as favourably situated, in respect to having access to books, as most of the Students who attend only partially?—Yes, I consider I was more favourably circumstanced, probably, than many; because, besides a considerable number that I had of my own, I was living in a neighbourhood where I could have access to the Libraries of the neighbouring Ministers; so that I had every advantage that could be obtained in a private way.

But notwithstanding that, you would have thought it a much greater benefit to have had access to a Public Library?—Yes.

How long did you commonly attend in each Session?—Just a week.

Can you state what number of Lectures you attended during the six partial Sessions?—Dr. Hill delivered three each week, and we had two or three from Dr. Lee, and two from Dr. Cook, besides attending Dr. Buist, when his class met; that would be seven or eight in the week, besides the Hebrew.

Then the result of your experience is, that you think a regular attendance for a certain number of Sessions would be a great improvement in the study of Theology?—I think it would be of advantage to attend at least one or two, if the law makes it necessary. I should have found it a great advantage, if I could have attended them all regularly.

It is presumed that you could scarcely ascribe any benefit to the very small number of Lectures that you attended?—As it pointed out the field, and the road to study at home, it was beneficial; but I should have found the other much more so.

Did you observe much difference in the circumstances of the Students at St. Andrews, at Aberdeen, and at Edinburgh, so far as you had opportunity to observe?—Yes, I rather thought that at St. Andrews it was in the power of the Professors to pay more attention, and to look better after them, than they can do in Edinburgh.

Did you observe any material difference in their circumstances, in respect of wealth or poverty?—The impression that I had was, that those at Edinburgh seemed to be in better circumstances, a greater proportion of them; but there was such an immense difference as to number, that I was not able to judge properly as to the proportion.

Are you speaking now with regard to general Students, or Students of Divinity?—Students of Divinity.

Did you remark any difference, in pecuniary circumstances, between the Students of Aberdeen, and those of St. Andrews?—No, I could not judge that there was any difference; I should suppose they were about upon a par, as far as I could judge.

So that any attendance which the one could afford to go through, you think the others also could afford?—Yes, I have no doubt they could have done it.

You probably may be acquainted with Students in the part of the country in which you now reside, who are in the habit of attending either at St. Andrews or at Aberdeen; have you ever observed, that those who are poor, prefer the one University to the other?—No, I did not consider, so far as my knowledge or experience went, that poverty led either to the one or the other; it may generally have been some accidental circumstance of vicinity, or sometimes it may have been from the advice of a friend; probably the Students may have been directed by persons who have studied at the one or the other, and may have followed their counsel. For instance, at the period I attended first at Aberdeen, it had been the practice, for a number of years, for Students to come from the Border, and that had originated from Students who had been settled there as Teachers, after having studied at Aberdeen; and they advised their scholars to go where they had studied themselves.

Might not the expectation of Bursaries likewise operate as an inducement?—I believe it did. In my own case, the circumstance that drew me to Aberdeen (for I was living at Dundee) was the adventitious circumstance of the fame of a particular Professor or two, such as Dr. Beattie for Moral Philosophy, and Dr. Hamilton as a good Mathematician.

And you think that most of the Students are determined very much by similar causes?—Yes, I should suppose they are. Were I to study over again, living at Dundee, I would not go further than St. Andrews.

Was much of the time of the Students at Aberdeen, in your time, occupied in writing notes dictated by any of the Professors?—No, unless when the Professor set apart a day for that purpose.

University of Edinburgh.

Rev. J. Gordon.

18 October 1827.

Was it not a daily exercise?—No, I was not sure if it would be allowed; but there were days set apart for dictating, and we generally had a very full outline of the Course dictated in that way; and we might fill it up ourselves, if we chose, more largely.

Was that for the purpose of Examinations?—Yes, there was a day set apart for that purpose too. The Course of Study at Marischal College, which I attended, is rather improved since that period; then, there was only a Greek class, no Humanity one. Had it not been that Professor James Beattie was an excellent classical scholar, and paid attention to Greek and Latin, along with his own Course, we should have been very deficient as to advantages in that way; but he devoted a part of each day to Greek, and another to Latin, for a considerable portion of the session. That is made up now by their having a first and second Greek class, and a first and second Humanity class. If that Lecturer were put upon the Foundation, it would be of great benefit to the University.

Were there Public Examinations at the end of the Session, or at any period of the Session?—There was always a Public Examination at the close, within a few days of the dismission. Each Professor was left to his own discretion, as to his own examinations in the class.

Were there Preparatory Examinations in any of the individual classes, for the purpose of assisting the Students at the Public Examinations?—No, not unless it was, that the Professor, once or twice, went over their Course, to know whether the Students had been attending to it or not.

But the same questions that were put at the Public Examinations, were not put previously in the individual classes?—No.

How many years is it since you attended the Philosophical classes in Aberdeen?—The Moral Philosophy class I attended in 1817.

How many years before that was it that you entered?—It was in 1796 or 1797 that I entered first.

The Rev. *Patrick Clason*, Minister of St. Cuthbert's Chapel, called in and examined.

Rev. P. Clason.

The Commissioners are desirous of having the benefit of your experience upon some points connected with Education in the Scotch Universities. You were a Student at Glasgow College?—I studied at Glasgow seven years; that is to say, five years at Philosophy and Literature, and two years at Theology.

Did you observe any material difference between the circumstances of the Students attending at Glasgow, and those at Edinburgh?—No; I do not think there was anything remarkable, either one way or the other; they were very much of the same grade.

Do you think the length of the Session at Glasgow is felt to be any inconvenience by the Students?—I do not think so. So far as my experience goes, there was rather a regret, on the part even of the poor Students, to part from the College, unless they had some peculiar call to the country. There were two classes of Students in the Philosophy and the Theology classes, when I was there—the Irish and the Scotch. The Irish Students came always the first week in November, so as to be ready to enter the classes immediately after the Communion in Glasgow. The Scotch Students were supposed to come between the 10th and the 20th of October. Then the greater number of the Irish Students went away about the time of the Communion in April; but the more eminent and industrious, in many cases, remained till the 1st of May. The bulk of the Scotch Students remained till the end of the Session, which was an intimation that they considered the length of the time an advantage. I recollect Professor Young usually taught the Greek class after the 1st of May (which is a great day in Glasgow) till the 15th of the month, and a number of the country Students remained.

Are you able to state at what expense a Student was able to live in Glasgow, about fifteen years ago, when you were there?—I believe the Commissioners will hardly credit how little a Student, that is disposed to get knowledge, can live upon. The last time I was in the country, I met with a gentleman that said he lived for about seven or eight pounds a Session.

Exclusive of his class fees?—Exclusive of his class fees. He was poorer than the generality, but a very industrious and eminent Student.

At what rate do you think a Student could live, in tolerable comfort, upon the average?—Upon £12, I should say, considering that he gets little articles from the country. Perhaps, if he were to buy everything, it might be more; but I think he might live with comfort upon that.

Did your attendance embrace the years 1811 and 1812, which were years of great scarcity?—It did.

Are you enabled to state, whether any considerable proportion of the Students of Glasgow come from the West Highlands and Islands?—Yes; the West Highland Students, I fancy, go there, without any exception.

Do you believe that the Students from the West Highlands are, generally speaking, a more opulent class than those from the North Highlands?—I cannot speak well to that; I have not had so much intercourse with the Northern Highlands, but I should suppose their circumstances must be much the same.

It is presumed that those are among the poorest of the Glasgow Students?—The Irish Students were reckoned the poorest at that time. I knew young men from the Lowlands that had as much to struggle with as any of the Highland Students.

What is your opinion as to the propriety or expediency of enforcing regular attendance at the Divinity Hall?—My opinion is that it is of very great importance, both for the Professors and the Students.

Do you conceive that it would exclude any considerable proportion of those young men who it is desirable should enter the Church?—No; I think it would deliver them from a temptation that the present law has thrown in their way.

Of which you think they often avail themselves, when there is no necessity for it?—In many

University of Edinburgh.

Rev. P. Clason.

18 October 1827.

cases they are tempted to avail themselves of it; but I think, if the thing were fairly propounded to a young man, he would see the advantage of attending regularly, and the Professors would teach with ten-fold vigour. I have heard Dr. Finlay complain of Students coming in in that way, merely enrolling their names, and hearing no Lectures; he said it would be as well for them to send their sermons by the carrier, and he expressed his disapprobation of the practice.

Then your belief is, that all those young men who are seriously inclined for the Church, and who it is desirable should prosecute their studies for the Church, would still continue, and would not be excluded by enforcing regular attendance?—I think so; and that it would be a great benefit to the Church, in holding up Theology as a more important thing than it is held up by the present law; because the students are apt to while away the four years in a sort of drowsy way, as if the Church had given them nothing to do but to accomplish the five Exercises that are prescribed.

Is it your opinion that the state of the present law, in regard to the Divinity Hall, has a tendency to encourage some to enter there, and to take out their Licences as Preachers, who never have had any very serious disposition towards the service of the Ministry, or any prospect of being useful?—I have known students that have enrolled in the Divinity Hall, and that have attended it without ultimately designing themselves for the Church. Sometimes they had Bursaries, and some of them were studying law at Glasgow, others Medicine. Some of them were destined for being writers in Glasgow, and attended the Divinity Hall as a qualification to hold a Bursary. I think that it would at any rate put Theology in a more important light to them.

Do you think that many are enabled, by the present system, to obtain Licences, who, if a more rigorous system of study had been enforced, would not have thought of attempting to enter the Church?—Probably so. I think it would be desirable, if the entrance of young men into the Divinity Hall were held out as a thing that distinctly marked them as students for the Church. For example, with respect to the students I have mentioned, who were studying law, but who entered the Divinity Hall as a qualification to hold Bursaries—if they had been required to go through Theological Exercises, if they had been examined upon the Lectures, and been altogether treated as expectants of the Ministry—I think it would have almost deterred them from enrolling their names as students of Divinity.

Then the Commissioners may collect it to be your opinion, that any, who might be kept back, in consequence of regular attendance being enforced, would not, in point of fact, be any loss to the Church?—I think so decidedly.

Does your experience enable you to say, whether you think that young men (generally speaking) living in the country, who are irregular students, have sufficient access to books, to enable them to prosecute their Theological studies with advantage?—It is exceedingly difficult in the country to get that description of books that a student of Divinity should read. I remained a winter in the country after I had finished my course of Theological study, and I found it very difficult indeed; and I was in much more favourable circumstances than many others, because I was in the Lowlands; that is one very serious evil which *irregular* students of Theology are exposed to, that they do not get books, and they are obliged to take the floating Theology that is about them; and they have nobody to direct them how or what they should read, except perhaps the clergyman of the parish.

Then you do not think that the study of Theology can be advantageously prosecuted, in ordinary cases, by young men in such circumstances?—No; that is to say, a great deal more would be done by their attending regularly, and the Professor would have much more satisfaction in thinking that he was addressing all the students destined for the Church.

Is it your opinion that the system of irregular attendance has tended also, in many instances, to diminish the ardour and the steadiness with which Classical Literature has been prosecuted, and the study of Hebrew followed out, by young men remaining in the country?—In the country, they must pick up the Hebrew as they can: to be sure, the law now requires a regular attendance of one year at the Divinity Hall, but the law does not bind them to study Hebrew at the University; so that they run the risk of studying merely what little of it they can get in the country.

Did you attend the College Chapel while you were a student at Glasgow?—Occasionally; not often. I had a private friend in Glasgow, and my father wished me to go with his family; and, on that account, I did not attend often, but I went sometimes.

Was attendance enforced at all, or was it pretty generally observed?—My impression is, that, in general, the Chapel was not so ill attended by the students as might have been expected. Dr. Meikleham attempted to enforce attendance; but I think he was obliged to relinquish it, that year I was in his class, before the close of the Session. He did sometimes fine for absence from the Chapel, but he was always ready to give dispensation, not only to Dissenters, but also to those who, like myself, attended one or other of the City Churches.

Was the service at that time performed by an ordained Minister, or merely by a Preacher?—During my Philosophy studies, Dr. Macturk officiated as Chaplain; he was ordained by the Presbytery of Glasgow: and then, by the time that I returned to the Divinity Hall, Mr. Mylne performed it for two years, being then a Professor. Dr. Macturk was the Professor of Church History, while he officiated.

Then it was not performed at all by Preachers, during the period you were there?—No.

Did you understand it to be the general practice to appoint Preachers?—It had been in the old times; and they recurred to that practice, I understand, when Mr. Mylne resigned.

Is there anything that you can suggest, with regard to the College Chapel, in order to put it upon a more satisfactory footing?—I am hardly prepared at this moment to say what measures should be adopted. I always thought that there was a want of sympathy between the

593

University of Edinburgh.

Rev. P. Clason.

18 October 1827.

different parts of that congregation. I was, and still am, of opinion, that the edification of the students would have been more effectually attained, if they had been in a church surrounded by a congregation; and I should certainly think that Preachers, who have just risen from the ranks themselves, cannot have that hold of the minds of young men that an ordained Clergyman would have.

Do you think, then, that attendance in the College Church would be preferable for the students?—I am hardly prepared to answer that question at present; but I think it would be for the good of the students, to mingle in an ordinary congregation.

Do you think there is any risk that the young men will consider it merely as a branch of Academical discipline, instead of being a religious exercise; or do you think there is sometimes a tendency, among those who conduct the service in the College Chapel, to frame their discourses in a style more Academical than serious?—Yes, I am quite sensible, in the course of my own preaching in that place in my younger days, that the circumstance of the congregation being almost entirely Academical, gave a tone to my feeling, before I did preach, leading me to consider the sermons that should be delivered them, as rather addresses to the understanding, than to the conscience and heart. I know that those in my situation had the same impression; but Mr. Jardine used to exhort the Preachers to be plain and faithful, and by no means to philosophize; telling them, that the students and Professors had enough of Philosophy during the week, and required the Gospel to be taught them, in simplicity, on the Sabbath; which showed that it was the impression of the Professors themselves, that there was a tendency in the preachers to sink into a frigid style.

Do you not think it possible that the very circumstance of the Discourses being reported in the notes of the students of Logic, in the way of a College Exercise, might have some influence on the mind of the Preacher?—Yes, perhaps it has. When I was a sudent of Logic, that was not the practice; it was only the sermon preached on the evening of the Communion Sunday in April, that was reported on the week following, and a Prize given for it.

Additions on revising Evidence.

"I crave permission of the University Commissioners to add some remarks on the subjects on which I was examined by them.

"1. On the subject of Theological Tuition. I am still decidedly of opinion, that it would be of much advantage to the Church, if four years of regular attendance on the instruction of the Theological Professor were enforced on all students of Divinity; and if a Chair of Biblical Criticism were endowed in each of the Scottish Universities, the acquisition would be most valuable. I have taken it for granted, that the Professors examine their students on the different branches taught by them. It might prove an additional incentive to the more ardent study of Divinity, if the Universities were invested with the power of conferring Theological degrees on those who submitted to an Examination at the close of the whole Course prescribed by the Church. The Examination would, of course, be conducted by the Members of the Theological Faculty, and if in presence of all the students of Divinity, so much the better. Many might not aspire to such an Academic Honour; but if the higher degrees were only conferred on those who had submitted to the Examination for this inferior degree, this would incite many to submit to the Examination.

"2. I expressed some hesitation, in giving my Evidence, as to the propriety of the Professors and students of Glasgow College returning to the old practice, of attending the College Church on Sundays. It is well known that their secession from that Church occasioned a great popular clamour, and I had some doubts, at the moment, whether the Professors might feel it consistent with their dignity, and the discipline of the University, if they were required to retrace their steps in this particular. But I think it right to state now, that any hesitation I felt at the moment, is quite removed. The actors in that revolution have been long ago taken from the world; and while none of those evils that might have been anticipated at an earlier period, are likely to be felt now, the measure, I am convinced, would tend alike to promote the dignity of the Professors, and the spiritual good of the youth under their care. I do not see how the College Chapel can be put on a satisfactory footing; but if this Establishment is still to be continued, the practice of employing young men to preach in it cannot be too soon abandoned.

(Signed) "PAT. CLASON."

Edinburgh, Saturday, 20th October 1827.

The Right Honourable the LORD ADVOCATE in the Chair.

Douglas Cheape, Esq., Advocate, Professor of Civil Law in the University of Edinburgh, called in and examined.

Professor Cheape.

20 October 1827.

You have been appointed Professor of Civil Law in this University?—I have.

Have you had any opportunity of considering the Queries sent to the Senatus Academicus by the Commission, and the Answers which they have returned?—I have not seen either Queries or Answers.

Since your appointment, have you arranged your plan of conducting your Class?—Certainly; I have formed a pretty distinct idea of my plan.

Will you have the goodness to state the course you intend to pursue in conducting the business of your class?—Perhaps, previously to stating anything upon that subject, I might be permitted to say, that, as I have not yet entered upon the duties of my class, and as one's views upon such a subject are of course very liable to be changed by experience, I should not wish any opinions of mine upon such a subject recorded, except with the explanation, that I have not had that experience which is necessary to enable me to speak with any degree of confidence upon it. So far as I have been able to arrange my plan, perhaps it would be as well to speak of it with reference to the changes from the former system. According to the plan that was adopted by the last Professor, and which I believe has been adopted ever since the institution of the Chair, it has been usual to have two Courses of Lectures—one in con-

University of Edinburgh.

Professor Cheape.

20 October 1827.

nection with the Institutes, and another in connection with the Pandects. Upon the best consideration which I have been able to give the subject, I think, perhaps, it would be more consistent with the objects of such a Chair, to consider the Civil Law as one system, and without any particular connection with any treatise upon the subject—for the Institutes and Pandects may be considered in some measure as treatises on the Science—to consider it as one system, and to view all the books of the *Corpus Juris*, which are of course the chief authorities upon the subject, merely as authorities. As an order is necessary, the order of the Institutes is the one that I should propose to take, as being the only systematic work upon the subject. There are many subjects in the Institutes that of course require, in order to be practically useful, to be illustrated, supported, and extended, by authorities from the other parts of the *Corpus Juris*. There are also many subjects of considerable importance, that are not noticed in the Institutes at all; as, for example, the Law of Evidence is not introduced there at all; of course it would be necessary to introduce those subjects in their proper places.

Then you propose to give a systematic view of the subject, without reference to its application, either to the Institutes or to the Pandects?—I mean to take the subject very much in the order of the Institutes, and to lecture upon each subject, giving what appeared to me to be the views of the Civil Law upon that subject.

Giving a full and complete view?—As full and complete as I can make it; of course, giving a prominent place to those views that appear to me to be most important in the present times, and more especially to those that bear most upon our own practice.

Then is it your plan to have one or two Courses, after you have been able to complete your whole Lectures?—I should hope that it would be practicable to throw the whole into one Course of Lectures.

Extending over one or two Sessions?—One Session—a pretty long Session perhaps; but that is a matter upon which one's views might change, as the materials grew upon one. But I think that, consistently with the present taste for the science, perhaps one Course would be fully as beneficial as more, if it were possible to comprise in it such general views as would lead, to private study, on the part of those who wished to prosecute their inquiries further.

Has it been any part of your plan, so far as you may have matured your ideas, to continue that Course during the Summer Session of the Court of Session, when most of the students may be supposed to be in Edinburgh?—I have not contemplated lengthening the Course beyond the ordinary Session of the College; but I think it might be likely that, at some future period, I might find it advisable to give a short Summer Course upon such historical matters, connected with the subject, as could not be very well introduced, with a due regard to doing justice to the other parts of it, in the Winter Session.

Do you understand that, according to the plan which has been followed formerly, there was considerable repetition in the Professor necessarily going over the same subjects very much?—I should think that it is one of several evils of considering the subject, first in connection with the Institutes, and next in connection with the Pandects, that it must be almost entirely a repetition, and perhaps a repetition of not the best kind; because the Institutes, although perhaps not in the very best systematic order, according to our modern ideas, are yet in a tolerable arrangement; but in the Pandects there is no attempt at arrangement at all; so that, by going over the system in connection with the Institutes, you go over it as a system; and by going over it in connection with the Pandects, you do not. It appears to me, that the only way that the Pandects can be studied as a system, is by being brought to bear upon those subjects in the Institutes to which they relate. The Pandects should be viewed as rather of the nature of authorities: they are, as it were, a sort of mixture of statutes and decisions, and of course the same is fully as much the case with regard to the Code and the Novels. It must be understood that I speak entirely hypothetically—merely from my views of what it would be possible to do according to that plan, and not at all according to any view of what has been done.

Supposing that you should find that one year would not comprise the whole instruction which it might be desirable to give in your class, does it occur to you that it would be better, after your Course was prepared, that the second year should be a continuation of the first, including such subjects as you could not overtake; or that it should be considered as a kind of more advanced class, going over again the more important parts of the subjects discussed in the first?—It has not occurred to me to consider that subject very carefully; but I should think it pretty obvious, that it would be better *not* to make the second Course such a continuation of the first as would render the attendance of them both necessary; for this reason, that there are many gentlemen who are neither required nor inclined to attend the class more than one year.

And therefore you think you should endeavour to give them, in the first year, as much instruction as is required, according to the regulations which compel them to attend?—I think that the first year ought to be, although imperfect on some subjects, complete as a system. I mean to say, that it ought to go over the whole system; of course, dwelling more or less upon the particular parts of it: and I think a great deal might be done to embrace all that is useful in the Civil Law, by leaving out, or at least passing very lightly over, those parts that are not very useful—such parts, for example, as the Law with regard to Slaves, Adoption, and subjects of that description, and perhaps also the Roman Law with regard to Crimes; at least, not to dwell very long upon that, except with regard to those general topics, such as the nature of Dole, which is common to all systems, and the age of delinquents, the prescription of crimes, and some of those subjects in which we have borrowed from the Civil Law.

Is there any regulation by the Senatus, or by any other authority, prescribing that there shall be a Course upon the Institutes, and a separate Course upon the Pandects?—I do not know of any.

595

University of Edinburgh.

Professor Cheape.

20 October 1827.

In point of fact, do you understand that the greater proportion of those who attended the Civil Law class, only attended the Institutes, and did not also attend the Pandects?—I can only answer for myself; I only attended the Institutes.

According to the view you have now given, it is presumed that your Course would not be much taken up in the History of the Roman Antiquities, or in the explanation of any particular customs, upon which any particular Law might be founded?—Certainly not. Of course, the two are mixed up to a certain extent almost inseparably, and it is absolutely necessary to the proper understanding of the system, that there should be some preliminary Lectures as to the History of the Roman Law; but I should endeavour to keep that as much free from the Roman History, and, perhaps, even from what are strictly Roman Antiquities, as possible; and with that view, I may mention, that it appears to me that some deviation from the ordinary method of considering the History of the Roman Law, with regard to the History of the Roman State itself, might be desirable. I observe that it has been almost uniformly the case with all authors who have written upon the History of the Roman Law, that they have given a general History of the Law, without any divisions, except such as are suggested by particular periods in Roman History, at which changes took place, either in the Law or in the Legislature. Now, I attempted to consider the subject in that way; but it appeared to me, that from the sources of Legislation in Rome being so many and various, that to consider the subject in that way, was not only to treat, in a manner, of more than one subject at a time, and consequently to confuse and perplex the subject, but that, from the same cause, it was almost writing a History of Rome. Now it appears to me, that the more strictly legal method of considering the matter, and the one which I have adopted, will be to consider the subject, not according to those divisions of epochs or periods in the Roman History, but according to those divisions of the component parts of the Roman Law which we are all quite familiar with, such as *Plebiscitum, Senatus-Consultum,* and so forth, and to give an account of the origin, progress, and authority of those, and of the different periods at which they prevailed; and I think this plan will, perhaps, not only tend to clearness in distinguishing the nature and effects of the several kinds of Laws, but it will also tend to shorten the subject, by keeping it clear of many parts of History and Antiquities, which would otherwise be mixed up in the general mass. In order to illustrate my meaning, I may give an example. Heineccius's History of the Roman Law is composed upon the principle to which I have ventured to object: he divides the subject into five different periods, and, as there is no particular period in which more than one of these different kinds of Law did not prevail, it leads to the consequence I have just referred to. So far as by the History of the Roman Law is meant the History of the rise and progress of the Laws in connection with the Roman State, of course it is absolutely necessary that the history of each particular component part of the Roman Law should be given; and not only so, but after that account of the Law has been completed, that we should go back upon the subject, and give an account of the different Codes that have been formed at different periods—the Papyrian Code, the Laws of the Twelve Tables, the Perpetual Edict, the Hermogenean Code, and so on, down to the Compilations of Justinian. But if by the History of the Roman Law be meant its history in after-times, I think that is a field upon which, perhaps, it might be as well not to enter very largely, except so far as it relates to our own country, both because it is a subject of immense magnitude, and because, if it is to be considered in connection with the legal Polity of the different States of Europe, it would require a lawyer from every country in Europe to speak of it; and if it is to be considered only in connection with that international Law that belongs to all countries alike—if the Civil Law is to be spoken of as the foundation of Grotius's Work, that belongs to a different Science: so that I think a very general account of its progress in Europe might be sufficient, with a view to my subject—something more particularly, certainly, as to our own country: but, even from the difficulty that any Scotch Lawyer would have of speaking of the History of the Civil Law in England, and of its precise effects upon the English Law, upon which English Lawyers themselves are much divided, any one may easily estimate the extreme and almost insuperable difficulty of speaking of its effect in the different countries of Europe. Of course, some general account of its being received in different countries, and the period at which it appeared, no doubt comes completely within my plan; but that will not occupy much time—perhaps half a lecture would dispose of that.

Are you aware that it was the opinion of your predecessor also, that a more extended Course of Lectures, of one year, would be preferable to the former arrangement?—No; I never had any intercourse with Mr. Irving upon the subject.

You will, no doubt, take occasion, in the progress of your Lectures, to mark the modification of the general principles of Civil Law in the different States of Europe, or the deviations from those principles, where it was necessary to the illustration of those subjects?—If it came in the way; but it is extremely difficult for any Lawyer in one country to speak of the modifications that the Laws of another existing country have received.

The question related only to the more marked deviations which have occurred in the different States that profess to be guided by the general principles of the Civil Law?—Not only is the Civil Law a subject of itself, but its effect upon the Law of every Nation in Europe is a subject of itself, and a very extensive subject. No man can pretend to tell, without having made it his particular and almost exclusive study, the precise effect that the Civil Law has had in Germany, in Spain, in Denmark, and in other countries. I might meet with some striking facts upon those subjects; and certainly, if I met with any striking and well authenticated fact, I should not hesitate to mention it; but as to entering upon those subjects, *as a subject,* I could scarcely presume to do so.

Then, according to the plan you have proposed to yourself, it would appear that your object would be, to endeavour to make your Course of Lectures somewhat analogous to some of those

University of Edinburgh.

Professor Cheape.

20 October 1827.

Treatises of Pothier, which embrace most of the Civil Law, without entering very minutely into the laws of the different countries?—I am not acquainted with any Treatise of Pothier's, except one, which seems to me to answer the foregoing description, and in that Treatise he, perhaps, considers the Law of France, more than I would find it necessary to consider any other law in connection with the Civil Law. I mean to say, that he mixes it, and embodies it more with the subject; but I am not acquainted with any such Treatise of Pothier's, except his Treatise of Obligations. His Pandects are chiefly a work of *arrangement*.

Have you any other explanations to state, with regard to the nature of the Course of Lectures you propose to give?—There are none occur to me at present.

Do you propose to have any Examinations in your Class?—I do.

At a separate hour, or at the same hour?—I should be very well pleased to have them at a separate hour; but I find, from conversations I have had with some of the other Professors upon the subject, that it is scarcely possible to get an hour for Examinations, in this College, which does not interfere with something else.

Were not two hours formerly dedicated to the Professor of Civil Law?—They were; but they were attended by separate classes, and one Student only attended one hour of Civil Law.

Then, if you lecture only one hour, the other hour must be vacant?—Not vacant, perhaps, to the students—they may be attending other classes; and from the new regulation with regard to the attendance of Writers in this class, there are many gentlemen who attend my class for one hour, and Conveyancing the other; it would be scarcely possible to take that hour.

Can you mention the two hours at which Civil Law was formerly taught?—From two to three, and from three to four. Under the former system, no student attended that class more than one hour, although some of them attended two years. But, if I find that there is any reasonable prospect of getting students to attend, I think from four to five, or from four to half-past four, might perhaps be made use of.

Of course, a good deal must depend upon the number of the students?—Certainly. There is no class in the College that has a separate hour for Examinations, and I believe that all who have proposed it, have found it quite impracticable. I understand that Mr. Napier has Examinations in his class; and perhaps his Examinations, being those of a Law class, may be more nearly what I should propose mine to be, than any others in the College.

Will you state the nature of the Examinations you contemplate?—In the first place, I may mention, that I propose to innovate so far upon what has been the former practice in the class, as to have my Examinations in English. It is, perhaps, needless to go into the reasons of that at present, although I shall willingly do so, if required. I should probably find it almost impossible to make any Examination so specific and determinate, and so pointed as it ought always to be, by examining merely upon the Lectures. I therefore apprehend that it will be necessary to have something in the way of a Text-book to examine upon; and, as it would be very desirable, likewise, that any such general view of the subject as I can give in Lectures, should be combined with that more accurate knowledge which can only be derived from the study of a Text-book, I should be very glad to reconcile those two objects, by making my Examinations in reference to a Text-book. The Text-book that I proposed to examine on, is Heineccius, and I do not think there will be any difficulty, from what I have learned of the mode of Examinations in some of the English Universities, in making both the questions and the answers, although with reference to a Latin book, sufficiently distinct in English, and taking as much Latin with it, in the form of maxims, definitions, and so forth, as may be necessary to show an accurate knowledge of the subject. I understand that this is the mode of Examination pursued, upon the most abstruse and learned subjects, in some of the English Universities, more particularly upon the works of Aristotle. I understand that the Examinations are conducted chiefly in English, at the English Universities.

As being better adapted for the purpose of showing the individual's knowledge of the subject?—Yes. My Examinations will be perfectly optional; I shall examine only those gentlemen who intimate their willingness to be examined, by putting down their names, or in some other way; and that being the case, I should wish to make the Examinations both as little formidable, and as effectual, as possible; and I think English Examinations will be both less formidable and more effectual.

Does it not occur to you, to be rather desirable to examine all, except such as intimate to you that they do not wish to be examined; and to make them assign their reason for it?—I should imagine there will be very few who will not intimate their willingness to be examined; and perhaps things of that sort generally go on better when there is a consent on the part of the students.

It is presumed that the young men that you expect to attend your Class, are generally those who are bringing up to the profession of the Bar?—If that were the case, I should be more doubtful as to whether the Examinations should be in English or Latin; but a great portion, perhaps the majority of my class, are young men, among whom the standard of scholarship cannot reasonably be rated very high. A great many of them are Writers to the Signet—gentlemen who might be very good Classical Scholars at one time, but who very frequently are much rusted in Classical Literature.

Although that may be a reason for not examining them in Latin, is that any reason why they should not be examined at all?—Certainly not; I should wish to examine, of course, as many as I could with advantage.

What do you understand will be the number of the class, since the regulation of the Writers to the Signet came into force?—I have not the least idea; I should think it will increase the class probably by twenty or twenty-five.

In that case, will it not be almost essentially necessary to have either a separate hour, or to

have an hour or two upon the Saturday, for the purpose of Examinations?—I should be glad to devote an hour on the Saturday to Examinations, but I am afraid it would not go down with the students. My idea, of having a separate hour, was what partly influenced me in regard to my intention of making the Examinations optional, letting them come or not at that hour. I found that the general idea was, that the study of the Civil Law was more consistent with attending the Conveyancing class than the Scotch Law; and indeed it seems to be almost out of the question studying Civil Law and Scotch Law in the same year.

Do you think more advantage will be gained to the students, by your lecturing the whole hour, than by your examining a quarter of an hour, and lecturing for three quarters?—By no means. I think that Examination may be the most beneficial of the two; and if I could assure myself of getting a tolerable number to attend a separate hour, I should be most happy to have a separate hour.

According to the arrangement that is now made, will your class be taught at the same hour with the class for Scotch Law?—It will.

Then is it with a view to enable the students to attend the Conveyancing class, that you think a separate hour for Examinations could not be obtained?—No doubt, a separate hour might be obtained. I could fix a separate hour; but the question is, how many would attend it.

It is presumed that none of the gentlemen, who are required by the regulations of the Writers to the Signet to attend your class, can have previously attended Scotch Law?—Probably not many.

Can any benefit be derived from attending the class of Conveyancing, although they may wish, in order to save time, to do it in the same year, unless they have attended Scotch Law?—I have had several applications from gentlemen studying as Writers to the Signet, and three to four seems to be the most convenient hour for them. Some of them have previously attended Scotch Law; some gentlemen attend my class, in consequence of the new regulation, who have attended Scotch Law.

After the regulation has come fairly into play, it is supposed that none will attend Scotch Law who have not previously attended the Civil Law?—No; but my view in taking the same hour with Mr. Napier, was merely this: that no one would attend the Scotch Law and the Civil Law in the same year; they might, or might not, attend the Conveyancing class and my class the same year.

There being only three Law Classes, would it not be desirable those three should be at separate hours?—It is scarcely possible to make them separate, as there are only two hours for the three; unless I were to alter the hour altogether, and take one o'clock, or take from four to five; one o'clock is scarcely fair to a person in the Parliament House.

If a separate hour for Examinations is necessary, there is an hour from four to five, which is not occupied in the College at all?—It is not; and I may repeat, that that was one reason for my taking the hour from three to four. If there is a separate hour for Examinations, it is desirable to have it the hour immediately adjoining the hour for Lecture.

Supposing you were to intimate that you would take the Examinations at the next half-hour, and that you should require a good excuse from those that do not attend: do you not think, considering the age of most of the students, that most of them would attend?—The age of many of them at present is very advanced.

Omitting those that may be beyond the age of regular students, but taking the regular students commencing their studies?—I do not know that any distinction of that kind could be made, except by the students themselves.

Might it not be made part of the regulation, that the Examinations must be attended, as well as the instruction by Lectures, and that all regular students who wished to be exempted from the Examinations, must offer an excuse?—I think it would come very much to the same thing; I think there would be very few of the regular students who would not intimate their willingness to be examined; and in a class so advanced as that, I think things go on more smoothly, when there is nothing but willingness on both sides, and no compulsory discipline. I think they would all intimate their willingness to be examined; but that is a matter upon which one must be very much guided by experience. I may try one plan this year, and the next year, if it did not succeed, I might try the other.

Do you apprehend that the discontinuance of the Examinations in Latin, may occasion a greater neglect of Classical study than has hitherto prevailed on the part of the students of Law?—I should think, with respect to students that come to a Law class, you must take their Classical knowledge just as it is. If they are good Classical scholars when they come there, it is in vain to think that the Latin studies of a Law class will make them much better; if they are not good Latin scholars, any such examination must be a mere farce. But I may explain that, although it appears to me that the examinations will be most effectual in English, the plan that I mean to follow does not dispense with the knowledge of Latin on their part, because, though they are examined in English, it is a Latin book that they prepare for the examinations on; and in that way, I would wish to keep up their connection with the language, as this Law is, as every one knows, intimately connected with the particular language in which it is written.

The Text-book you mean to use is Heineccius's Institutes?—Yes.

You are aware that gentlemen coming to the Bar are examined upon Heineccius's Pandects; how do you mean to prepare them for that?—I think any man that could be examined upon Heineccius's Institutes, would have no difficulty with the Pandects; but I should recommend, that, along with my Lectures, in order to give them an accurate acquaintance with maxims, definitions, &c.; they should read the Titles in the Institutes and the Titles in the Pandects, which bore upon the subject. I should perhaps examine them generally upon the whole;

University of Edinburgh.

Professor Cheape.

20 October 1827.

or, if I found that I could not manage to make the examinations effectual in that way, I should give so many Titles to be examined upon on a certain day. If I found that the general knowledge they obtained by reading, in connection with my lectures, was such as to enable them to go through a tolerable examination, of course that would be much better than any examination, with reference to preparation upon a particular subject.

Do you contemplate giving any Prizes?—That is one part of my plan; but I must go on by degrees. I should think, that after getting a little into the way of the class, not only Prizes might be given for good examinations, but that Theses might be written by the students.

Upon particular points connected with the Course?—Yes. Probably next winter I should like to have Prizes for good Examinations, and Prizes for Theses likewise.

Will you have the goodness to intimate to the Commissioners, at the period of the Course when you think you can best perceive the effect of the system, the number of your class who undergo examinations, and the result generally of the examinations?—I will do so.

Do you contemplate that the students should attend your class more years than one?—No. I think, according to the present taste for the subject, I cannot expect them to attend more years than one.

Has it not been the practice for gentlemen coming to the Bar to attend two years at Civil Law?—I did not attend for more than one year. I believe it was frequently the case that they attended more than one year, but that was at the time when there were two classes; but I cannot suppose that gentlemen, who are educating as Writers to the Signet, would attend my class more than one year. There is an attendance of two years in the Scotch Law, even with only one course; but that is a subject of greater importance, in this country, than Civil Law can be supposed to be, and of greater extent.

I mentioned, with regard to the order of my Lectures, that it would be the order of the Institutes. I should like to be understood, that in general it is the order of the Institutes; but every one who knows anything of the Institutes, knows that there are many Titles which may be more conveniently considered under one head, considerably separated in the Institutes; and perhaps there are some subjects which may be transferred to another part of the course. For example, it is a matter of doubt with me, whether the Law of Succession, which is introduced rather awkwardly in the Institutes, and among subjects that have no particular connection with it, might not be more conveniently considered in a different place; and perhaps such changes, as making the Law of Intestate Succession precede the Law of Testamentary Succession, might be made with advantage. The natural order seems to be, the Law of Intestate Succession, and then Testamentary Succession; such changes as these I should have no hesitation in making.

David Brewster, Esq. LL.D., called in and examined.

Dr. D. Brewster.

You were educated at this College?—Yes, I was.

And have resided in Edinburgh many years?—I have.

Have you any suggestions to offer to the Commission, with a view to the improvement of Education, as connected with this University?—Various ideas have occurred to me with regard to the mode of teaching some of the Classes here, such as the Class of Natural Philosophy and Chemistry. The general idea which has occurred to me, with regard to the Natural Philosophy class, is, that in place of a Course of Lectures as has been delivered for the last thirty years, it appears to me that a Course perfectly popular and experimental ought to be substituted, and that there ought to be one or two Lectures delivered weekly on the higher branches of Natural Philosophy; so that any student that wished to gain information upon those branches, might attend these, while all who wished for a more general knowledge of the subject, might obtain that at the daily Lectures. It appears to me impossible that an ordinary pupil can derive any satisfactory information under the present system; I do not mean under the present Professor, but under the system that has prevailed for the last thirty years. When I attended the Natural Philosophy class, I am satisfied there were not three individuals out of 150, of which the class probably consisted, who were able to follow the Professor, from the want of a knowledge of Mathematics; and a great many of those who entered the class as pupils, never went to the Lectures at all. This appears to me to arise, altogether, from the mixture of experimental and mathematical instruction in the class. In the Lectures which are delivered, there occur many Mathematical demonstrations, which no person, but one or two, can follow.

Can you study Natural Philosophy, well, without a knowledge of Mathematics?—It appears to me that a very great degree of information in Natural Philosophy may be obtained, without any knowledge of the higher Mathematics, and with a very slight knowledge of Arithmetic and Elementary Geometry.

Would you propose, for those that wished to study the higher branches, to combine Examinations and Exercises?—It appears to me that these would be of great advantage to the student; but the great point that, in my opinion, should be attended to, is a perfect separation of the Mathematical part, from the Popular and Experimental part of the Course. Such a separation would be of great use to the University and to the Professor, and all that do attend the class, would leave it with a very great degree of valuable knowledge.

Then, in point of fact, that would lead, almost, to there being two Classes of Natural Philosophy going on at the same time?—Partly. I do not think it would be necessary to have more than one or two Lectures a-week upon the higher branches of Natural Philosophy, combined with Examinations. I do not think there are above seven or eight young men who, in the present low state of Mathematical knowledge in Scotland, would ever attend those Lectures, and therefore it might, perhaps, be a hardship upon the Professors, to give another hour every day; but I think the whole might be accomplished by one or two hours every week. At all

599

University of Edinburgh.

Dr. D. Brewster.

20 October 1827.

events, it would be far better that the second Course should be omitted entirely, than that 200 pupils should sit and hear Lectures which they cannot understand. The seven or eight pupils who, I suppose, might aspire to a higher kind of information, would not lose much, as they could easily derive from works on Natural Philosophy all that the Professor can teach them.

Do you despair of the practicability of effecting some change in the mode of Mathematical instruction, which would admit of the students generally attending even the higher Class of Natural Philosophy, so as to derive advantage from it?—I think it never can be attained in this or any University in Scotland, because there is no motive that any young man can have to pursue Mathematics to such an extent.

In the case of those who are studying for any of the liberal Professions, or who intend to take the degree of Master of Arts, would you dispense with the Mathematical knowledge, necessary to enable a student to attend the higher branches of Physical Science?—I have some difficulty in answering this question; it depends upon what kind of honour is supposed to attach to the degree of Master of Arts. In other Universities, of course, they could not receive such a degree without a considerable portion of Mathematical knowledge; but I know that, in this University, almost all that have received the degree of Master of Arts, have had little or no knowledge of Mathematics.

The question proceeds upon the assumption, that some improvement in that respect might be introduced; if the degree of Master of Arts were rendered as honourable as in your apprehension it ought to be, do you think it would be at all creditable to the University, to admit to that degree those who have not a sufficient knowledge of Mathematics to enable them to attend with advantage on such a Course of Lectures as was given by the late Professor Robison or Professor Playfair?—My opinion is, that the degree of Master of Arts never can be an object of ambition here, because there are no consequences resulting from it. Of what importance is it to a young man to become a Master of Arts in Scotland, when it does not lead to Church preferment, or to anything whatever? In Oxford and Cambridge, I presume, the consequences are very different. I do not think that any improvement, such as is alluded to, can be made. I am confident that there is less Mathematical knowledge among the Clergy of Scotland, at the present time, when the students of Divinity are *compelled* to attend the Mathematical Class, than there was formerly, when that attendance was merely optional. Mathematicians cannot be made by University statutes. It is only by increasing the number of situations for which a knowledge of Mathematics will give a preference, that young men will be induced to pursue studies which are otherwise *proportionally* useless. I know of cases where young men, of the highest promise as Mathematicians, have abandoned Mathematics for Literary pursuits. I never scruple to advise such young men to do so. In answer to another part of the question, I may state, that it could not, in my opinion, be discreditable to the University to give a degree to those who have little Mathematics, since a majority of the Faculty of Arts, in every University in Scotland, have no Mathematical knowledge at all.

With regard to the Class of Chemistry, have you any suggestion to make?—My idea was, that there should be a regular Laboratory established, as there is at all the Foreign Universities, where young men can receive practical instruction in the analysis of Minerals, which now forms one of the most important branches of Chemistry.

Such as Dr. Thomson carries on at Glasgow?—Yes; or such as Berzelius carries on at Stockholm, or Stromeyer at Göttingen.

With reference to the number attending this University, do you suppose that one Laboratory would be sufficient?—I think it is not likely that more than twenty, thirty, or forty would enrol their names for such a purpose. The Private Lecturers in Edinburgh have such a Laboratory, in which the young men are taught the art of Analysis. It seems to me that it would be a matter of great consequence, in reference to the mines in Scotland, and the valuable ores that yet may be discovered. I am ashamed to say, that such has been the state of Practical Chemistry in Scotland, that those who take any interest in these matters, are obliged to send Minerals abroad to be analysed. I have sent large packets to Stockholm during the last ten years, never having been able to get any person to undertake them in this country.

Have none of the Apothecaries in Edinburgh Practical Laboratories of that description?—None.

Is not that very common in Paris?—I believe it is very common in Paris; many most distinguished men in Paris are Apothecaries.

Have you any other views relative to the Chemistry Class, which you wish to bring before the Commissioners?—Nothing else appears to me to be necessary. Lectures on Chemistry must necessarily be very popular. There is scarcely room for two sets of Lectures on Chemistry.

Does anything occur to you as to any of the other Classes?—It appears to me that the class on Natural History ought to be divided into two or three classes—one of Geology, one of Mineralogy, and one of Zoology and Comparative Anatomy. There is at present no class of Mineralogy in this University. A series of Lectures are delivered, but only for such a short period, that it appears quite impossible that any Professor can in that way communicate a knowledge of the Science. Mineralogy is a Science that requires a great attention on the part of the pupil, and a constant examination of Minerals.

Do you think a sufficient class could be got for each of those subjects?—I should doubt very much whether it could. When I suggest that, I merely speak with reference to the advantage of Science, and the advantage of the young men that might choose to attend the different courses of Lectures. I should doubt whether any Professor could have a sufficient number of students as to make it worth while.

Would the object you have in view be attained by the present course being extended?—Of course the same thing might be done there, that is done in the Mathematical class: the

University of Edinburgh.

Dr. D. Brewster.

20 October 1827.

Professor might lecture two, or even three hours a-day; but the evil might be remedied entirely, by giving the Professor a larger salary, where the number of students is not sufficient to indemnify him. They have, in Cambridge, a Professor of Mineralogy, and another of Geology; and abroad there is a separation of those classes in many of the Universities. The consequence of the present inattention to any one of these subjects particularly is, that we have not had, for a series of years, any pupils from this University that have distinguished themselves in Mineralogy. In the Foreign Universities there are distinguished young men, who make themselves known by their discoveries in Mineralogy; but there never has been in Scotland, for many years past, any person that has pursued Mineralogy as a Science, or that knows anything more about it than a little general information; and that is not the fault of the Professor, but of the system. In Stockholm, M. Berzelius has a number of pupils who analyse minerals, and who have been sent into all the Universities on the Continent; and now they are leading men of Science in Europe, in consequence of having gone through a complete course of Analytical Chemistry. The two Professors at Berlin, both most scientific men, were pupils of Berzelius. It seems to me that, if such a system were adopted, *viz.*, that of having a course of Lectures on Mineralogy delivered, and a Chemical Laboratory established, numbers of eminent young might be sent out from this University, who would be an honour to this country, and who would be of great use in exploring our national resources, with reference to our mountains and mines; which are absolutely unknown at present, except in cases where individual enterprise has induced private gentlemen to explore them.

Are you acquainted with the state of the Museum in this University?—Yes, I have had occasion, as a member of the Royal Society, to attend a good deal to the subject.

Have you anything to suggest to the Commission, by way of improvement with reference to the Museum?—It appears to me, as it does, I believe, to most people, that the Museum ought to be open to the public in the most liberal way that can be done; and if there is any difficulty in that respect, it ought at least to be opened to individuals who are pursuing scientific researches.

Are difficulties experienced at present in that respect?—Very great; so great, that no scientific individuals can get any specimen, unless they happen to be the immediate friends of the Professor; indeed, I do not know that any person pursuing Science has access to the Museum, excepting Mr. Wilson and Mr. Selby, who are publishing a work on Natural History. There is a valuable collection of minerals in the University, which nobody has ever seen, except a few that are put in show-drawers.

What collection is that?—The most valuable part of the collection, I believe, was sent home by Professor Thomson from Sicily, containing a fine collection of Sicilian minerals.

Where is that collection?—It is deposited in the Museum.

But not exhibited?—I believe not. I have myself, during the last fifteen years, been constantly occupied in studying Mineralogy, as connected with Optics and other subjects of that kind. At the commencement of my experiments, I got a few specimens from the Museum; but since that time I have got none. There was no direct refusal to furnish me with specimens; but the difficulties were always so great, that I gave up making such requests; and the consequence is, that I have been in the habit of getting specimens from Mr. Thomas Allan, Sir George Mackenzie, and Mr. Ferguson, of Raith, and other private gentlemen in Scotland, all of whom have given me, not only the use of minerals, but have allowed me to break down some specimens, and take crystals from others, when my experiments required it. I have got specimens also from Mr. Koenig, of the British Museum. I have received specimens also from the Cambridge Museum. I have got a great number from Stockholm, and many also from Copenhagen, several from America, many from the splendid collection of Mr. Heuland, and a great many from other Mineralogists on the Continent. The same minerals which I received from abroad, I knew were in the Museum; but they were inaccessible to me.

Is it necessary that you should have those specimens out of the Museum?—I should be perfectly content to have the use of them in the Museum. I ought to say, that for several years I never applied for that, because I knew that they would be refused; and for many reasons I did not wish to put myself into that disagreeable predicament.

It is not necessary in every case that they should be destroyed?—No; nobody would ask for a specimen for such a purpose from any Museum, unless it were one of little use, or of which there were duplicates.

It is presumed that, for the purposes of ascertaining the general character of a mineral, it is not necessary to destroy it?—No; my object often was merely to have a crystal for a few minutes, and to look through it.

It would be only for the purpose of Chemical Analysis that any destruction of the mineral would be necessary?—Yes, sometimes cutting or splitting a crystal is necessary in optical researches, if its natural surfaces do not lie in the direction that you wish to look through it.

In general, it is presumed, that for the purpose of ascertaining all the properties of the crystal, if it is a tolerable specimen, that can be done without any destruction of the specimen?—Yes; sometimes it might be necessary to detach a small filament or crystal from a specimen; but if you were to take 100 from some specimens, no eye would discover that the specimen had undergone any change.

Do you know anything of Dr. Hutton's collection?—I do. I believe that I am one of the curators of that collection, but I have never had any access to it.

Do you know anything of what it consists?—I have in my possession a list of all the articles originally deposited in the Museum, and a list of the articles found there many years after the collection was deposited there.

Is the Mineralogical part of it valuable?—It appears to me that the specimens are of no commercial value, but that they are of great scientific interest; that is, if you were to put

601

University of Edinburgh.

Dr. D. Brewster.

20 October 1827.

them up to sale, they would not bring much; but they have a great value, as being the collection of Dr. Hutton, and as illustrative of his curious speculations respecting the Theory of the Earth.

Those are not exhibited at all, are they?—I have never seen them. Many years ago, the Royal Society made an attempt to get a catalogue of them. Many weeks elapsed before they could get answers to their letters. At last they did make their way into the collection, and a list was taken by Sir George Mackenzie, Mr. Allan, and Mr. Playfair, of the Royal Society, who formed the Committee; and they marked in the list I have alluded to, all the articles that were missing.

Were many missing?—Very many: many of the most interesting specimens are missing. This collection was left to Dr. Black by Dr. Hutton. I am not quite sure that I am correct in saying that it was left immediately by Dr. Hutton to Dr. Black; it was perhaps given by Dr. Hutton's sister to Dr. Black, with the power of doing with it what he chose. Dr. Black presented it to the Royal Society of Edinburgh, and by a clause in their charter, it was deposited in the Museum. Dr. Black's original letter is in my possession. He gives it, I believe, upon the condition that the Professor of Chemistry shall be one of the curators, the Professor of Natural History another of the curators, and that two curators shall be appointed by the Royal Society of Edinburgh, who shall have the power of giving strangers an introduction to see the collection. I think this is expressed in the letter. The Society, I believe, never appointed two curators till lately; because they found difficulty in getting admission to take a list of their own property; but four or five years ago, various meetings were held, to get this matter put upon a proper footing, and to have this part of the Museum opened to the Society. There is a distinct clause in the Society's charter, authorizing them to have admission. The College have the right of holding the property, but the Society have, by their charter, the right of free admission, not only to it, but to the Museum generally; and not only for themselves, but for the public, as far as that can be effected (*quantum fieri potest.*) Those meetings were frequently held. Sir Walter Scott, Mr. H. Mackenzie, Mr. Alison, Sir G. Mackenzie, Mr. Allan, and myself, attended them; but we were always thwarted, whenever we came to do anything in the matter. At one of the last meetings of the Committee, two curators were appointed, viz. Sir George Mackenzie and I, but we never attempted to get admission into the Museum, because we knew that it would only lead to disagreeable consequences. There are various other valuable articles belonging to the Society in the Museum. There is a collection of articles from the South Sea Islands, which Captain Cook presented to the Society; those are in the Museum, but where they are I do not know, nor does the Society know. I think, however, that some of them are publicly exhibited in some of the rooms.

Have difficulties been experienced in obtaining drawings from specimens in the Museum?—Very great indeed. I believe there is a general rule laid down by the Professor, that no drawings shall be taken; and the door-keeper and the sub-keeper invariably prevent people from taking drawings. Dr. Greville, if I recollect rightly, told me that he was prevented from taking drawings. Dr. Nuterreith, the author of some works of merit, was also prohibited to draw in the Museum; and Captain Brown, of this city, was refused admission for the same purpose. I have been prevented from applying for permission in one case, because I knew that nobody would obtain it. In the article Organic Remains, which Dr. M'Culloch wrote for the Edinburgh Encyclopædia, of which I am Editor, the Fossil Elk of the Isle of Man was described. The Doctor had some slight drawings of it, made by some of the ladies of the Duke of Atholl's family. I wished to have a complete drawing for the purpose of publication, but I knew that the engraver could not get admission for this purpose, and all the plates of the article on Organic Remains have been published, excepting the one that is to contain the Fossil Elk.

That article is now in the Museum, is it?—It is. A drawing was made of the Elk, for the Supplement to the Encyclopædia Britannica, but it was an original drawing, made by Mr. Lizars, I believe, which of course our engraver durst not copy. No refusal was ever made to permit us to take this drawing. I never thought of applying for it, because I knew what the general rule was. I made a statement, on one occasion, to two of the Proprietors of the Encyclopædia, who were or had been Magistrates of Edinburgh, and who, I thought, as being, or having been the Patrons of the University, might have some right to get admission to it—Mr. Blackwood and Bailie Waugh. I do not think they ever took any means to get access to it; nor was it an object of any importance, because we were always in hopes that an arrangement would be made, by which access would be obtained.

Are you prepared to suggest any suitable regulations, under which, you think, the Museum might be given to scientific individuals?—It appears to me that there can be no difficulty in following the regulations that are adopted in every other Institution in the world, where the freest access is given to every person who wishes to use objects of Natural History for the purposes of science.

Have you yourself had occasion to make that use of the Museums in other Universities?—I have received, as already stated, minerals from Dr. Clarke, as keeper of the cabinet of minerals at Cambridge.

Which were retained?—Which I retained; some of them were of no consequence: there were many small crystals. And in the same way with the British Museum. Mr. Koenig sent me crystals, which I could not get in private collections here, some of which I necessarily broke down and used, and did not return. I believe I could command from any of those Institutions; and I doubt not that any individual in Edinburgh, if he were known to be pursuing Science, could command anything from any Museum in the world at this moment.

Do you understand that there are any rules actually laid down at the British Museum, or

University of Edinburgh.

Dr. D. Brewster.

20 October 1827.

does it depend upon the discretion of the keeper, as to the scientific part of that collection?—I have always understood that any person could go into the British Museum, and have the use of a room to himself, where specimens are deposited by the keeper of the department. If it was Mineralogy, he would be entitled to get minerals, and to take them into that room, and go there day by day to examine those minerals.

With reference to the transmission of specimens to a distance, do you think that is desirable?—I should think it would be quite unwise to allow any valuable mineral to be lent out of the Museum. I speak only of portions which could be transmitted without any risk; specimens, or portions of specimens, or perhaps crystals could be spared. Every person that has a collection of minerals could give ten, twenty, or thirty crystals, without knowing that his store was diminished; but I think that no unique specimen, or one of value, ought to be lent out.

You are merely contemplating the use of the Museum by persons residing here, or by persons coming to Edinburgh?—Yes; and it appears to me that every purpose would be answered by those individuals having the use of a separate room.

Is there no danger of their being abstracted in any case?—Perhaps there might be some danger; but I think that those who make any use of minerals for scientific purposes, do not in general care for the possession of them.

Do you think the Library of this University is sufficiently accessible to men of science and research?—I have always found it so. Whenever I applied for books, I never was refused anything. I have not had occasion to apply to it for many years; but formerly I always had the fullest access to the Library, either by getting out books in the name of a Professor, or in the usual way.

According to your recollection, had the students sufficient use of the Library, at the time you were a student?—No; I think not at all. It appears to me that the old system of depositing money for the use of books, is a very injurious system; it prevented many young men from using books at all.

Do you not think some such regulation necessary for the safety of the books, and to prevent their being ill-used?—They are actually ill-used when there is a deposit; the deposit does not seem to prevent the ill-usage, it only ensures the return of the book. Now it appears to me that the loss that would be sustained by allowing young men whose names are enrolled in the University, to take books out without making a deposit, would be so trifling, that it would not be worth the consideration of the University to replace the few books that would be lost.

Would you then enforce the return of the books through the Professor they are attending?—Just in the ordinary way that books are returned by everybody. I do not think that the University would lose more books than a private individual does, who lends his books freely.

As there has not been any very strict discipline in this University, in enforcing the attendance of students, and as they can go away when they think fit, how could those books be recovered, on the supposition of their being carried to the country, or even to the Continent?—I take it for granted, that in several cases they would be lost; but I suppose that the losses would be so trifling, that they ought not to be considered; and that they might be balanced by the salary of the additional assistant that may be necessary under the present system. I think there are very few young men who would actually go away with the book; I believe that many careless young men do go away with books; and perhaps leave a sum of money much greater than the value of the book.

Do you think there is much practical inconvenience suffered by the students, from depositing £1?—I can conceive the case of a young man at the University, carrying on scientific pursuits, who has occasion for a number of books at a time: it is not like a mere boy, taking one book and reading it through, and keeping it a month for that purpose; but perhaps a young man would require to have ten or twelve books at a time.

Do you think it would be expedient to allow students to read in the Library?—I should think it would be of very great advantage; at least, I found great advantage from it myself. I used to go and consult certain books, which very properly are not given out, such as the Transactions of Foreign Societies; indeed, I should have found it difficult to carry on my pursuits by depositing money on that account; I got authority from some of the Professors to have books out in their name. Perhaps the evil I complain of, may be remedied in this way; that if a young man is disposed to pursue a science with diligence, he may alway sfind a Professor that will give him the benefit of his name.

Have you any reason to think that young men of a studious turn of mind would be excluded from the same facility that you formerly enjoyed?—I have not reason to think so; but I can conceive many young men carrying on researches, who are not much known to the Professors, and I can conceive Professors not so liberal to young men as I found them.

Of course you would propose that there should be some limit to the extent to which students might borrow books?—Of course.

Is it not quite conceivable, that if many of them had the use of twelve or twenty books at a time, a great number of others must altogether be deprived of the use of those books?—I think, if they were books of common reading, that would be the case; but the books I would wish those young men to have access to, are books not commonly read. I think, however, the evil, if it is an evil, might be remedied, by authorizing the Principal or the Senatus, or somebody in the University, to give permission to some diligent young men that choose to pursue those subjects, to have a greater privilege than the rest, without a deposit; but I think it can scarcely be said to be an evil that is worthy of very great consideration.—Perhaps I ought to state, in explanation of what I mentioned about the second hour of Natural Philosophy, that there is a class in almost all foreign Universities, called Mathematics Applied—the application of Mathematics to the Sciences, where it is a separate subject altogether; and it is that peculiar department which I conceive would be treated of in the second

University of Edinburgh.

Dr. D. Brewster.

20 October 1827.

Lecture—the application of Mathematics to the higher branches of Astronomy, and Optics, and Dynamics, and several of those branches.

Is it your opinion that the nature of the Course of Lectures, which has been delivered in the last thirty or forty years in this University, is less popular than in the foreign Universities?—I should scarcely be disposed to say that; but in the foreign Universities, Mathematics are taught in a very different manner from what they have been taught here. I do not mean to say in a superior manner, but to a much greater extent. Almost all the young men in the foreign Universities are able Mathematicians; the young men that attend the Polytechnic School at Paris, know more of Mathematics than any of our Professors can be supposed to do. In that way, those persons are qualified to understand any course of Lectures that is delivered.

Have you anything to suggest with regard to the method of Classical instruction in this University?—No.

Edinburgh, Thursday, 25th October 1827.

The Right Honourable the LORD ADVOCATE in the Chair.

Andrew Coventry, Esq., M.D., Professor of Agriculture in the University of Edinburgh, called in and examined.

Professor Coventry.

25 October 1827.

Have you seen the Returns made to this Commission, from the University of Edinburgh?—No, my Lord.

Did you make a distinct Return with reference to your Class?—I was in the country when I got the notice, and I sent a letter to Dr. Duncan.—[*Extracts from this Letter, printed, pp.* 118, 119 *of Edinburgh Appendix.*]

Will you have the goodness to peruse the Returns at your leisure, and state to the Commission, in writing, any points upon which you may differ from the statements therein contained?—I shall do so.

Have you any general suggestions to make to the Commission, with regard to the system of education carried on in the College of Edinburgh?—As to the Medical branch, I should think it a great matter, that the students should get a little more general education, before they attend the Medical classes; and that they should at least attend two more classes in an University than they generally do—I mean those of Natural History and Natural Philosophy. My reason for so thinking is, because I have seen a great many Medical gentlemen, whom I knew long ago, and who, after returning from abroad, have regretted very much that they had not attended those two preliminary branches of education. In other respects, and in general, the observations that have been delivered by Dr. Duncan, junior, in the Medical and Physical Journal, Nos. 91 and 92, seem to me to be very correct.

Have you anything to suggest with respect to the other departments of the University?—Nothing but with respect to my own class.

With regard to your own class, will you have the goodness to state anything that occurs to you?—I think it would be of advantage if we had, in this University, a place for specimens, and useful implements of the best kind or form. Such a collection would attract the notice of young men studying Agriculture.

A sort of Museum?—Yes.

Will you state the nature of your Course of Lectures?—I have brought a book, containing two Introductory Lectures, explanatory of the object and plan of my Course. [*The witness delivered in the same.*] I divide the Course into two branches: one of them is a kind of preliminary one, containing an account of the principal subjects that may interest a Landed Proprietor, or a Practical Farmer; and the other contains a detail concerning Husbandry, viewed under two heads—Agriculture, and the Management of Live Stock; and there is likewise an additional part, that includes a miscellaneous subject, the extent of possessions, conditions, and endurance of Leases, and several other matters relating to Rural Economy.

Will you have the goodness to state the subjects embraced under the different divisions of your Course?—There is an outline of these in the "Discourses" or Syllabus, printed, and on the table, which I have always used since 1808; and I have not materially altered from it. I have, indeed, sometimes been obliged to leave out some parts, to make room for the due or fuller discussion of others; and I have occasionally taken different hours besides three o'clock, the common hour for that class. I have taken generally eight o'clock in the morning, for the purpose of considering subjects that I could not find room for at the three o'clock hour. For example, in the case of the cleansing crops, if I take Turnips at the three o'clock hour, I very likely attend to Potatoes, and some other crops, at eight o'clock; and if I consider the treatment of Black Cattle at three o'clock, I take, perhaps, that of Sheep at eight o'clock.

For what length of time does your Course last?—I have given, I believe, more Lectures in one Course than any Professor in the University. I have had sometimes above 140 Lectures, having part at double hours, from the middle of November to nearly the end of April; yet at other times again, a shorter course, from the month of May till about the middle of August. I have not, however, had any Summer Courses of late years. I should mention, that of late years, too, I have only lectured alternate winters; and one reason for doing so was, that I found that the gentlemen (many of them) agreed to put off attending the class for another year; and the next reason was, that I found I could not, advantageously for the students, complete at times a course. I offered to resign the class, rather than lecture every winter; for I could not, on account of other avocations, possibly do so; especially as I am frequently called as a witness to London, to attend the Parliamentary Committees, and upon other occasions.

Do you mean to continue that practice of lecturing only alternate winters?—I shall lecture this winter, though I shall give up the class next winter, if I cannot then do so. I was

University of Edinburgh.

Professor Coventry.

25 October 1827.

admitted on the 17th of December 1790, and I began the first Course upon the 16th of January 1791. Here is a note of all the Courses given since [*producing the same*], and I mean to fill up in it the hours of meeting, and the number of students. I shall do so, and then deliver it in to the Commission. There are some parts of the Course that I was accustomed to read at an earlier period, which I do not now read; but I give to all the students a pamphlet, containing notes upon some difficult parts of the subject, or those too minute in detail for them to follow in a Lecture. It is entitled, "Notes on the Culture and Cropping of Arable Land." [*The witness delivered in a copy of the same.*] There was likewise another pamphlet upon the subject of "Live Stock and Relative Subjects," which I used to circulate, but I have now no copies of it; and I have not had time to get another set printed, with the alterations I should wish to make.

Besides the subjects connected with the practical part of Agriculture, does your Course embrace anything respecting the habits and the growth of plants?—I lecture for three or four weeks upon the Structure and Economy of Plants, but only with respect to the application of that subject to Agriculture; I do not take notice of anything that belongs to the Botanical class, but I do of everything that could be turned to use in Practical Agriculture; and so with respect to the observations on the atmosphere and its variations.

How do you account for the number of your students having decreased: It is stated in the Returns, that at one time there were seventy-three, and now there appear to be but thirty?—They were at all times very various. In one summer class there were seventy-three, and in a winter class immediately afterwards, I believe there were only thirty-eight.

Does any other improvement suggest itself to you?—I think it were better, as it is so ample, to have the subject of the Course divided into two portions: not with respect to myself, for I would not undertake a more extended or double Course of Lectures; but I think it would be desirable to have the subject divided into two branches—one including what is connected with Agriculture strictly so called, that is, as to the management of Land, whether arable or pasture; and another the treatment of Live Stock; because the whole subject is so extensive, that I do not see that anything duly useful on both departments could be comprised in a single Course. Such an alteration would require, perhaps, a different arrangement of the Agricultural class, from what now exists.

What is the description of persons that generally attend your class?—They are very various. In the earlier years, till the year 1813 and 1814, there were a great many farmers' sons; but since that time, there have been much fewer of those. Several of the gentlemen that attend, are students of Physic, and part of them are connected with the Law—Lawyers and Writers. I do not think so many of the last have attended of late years, because there seem to be fewer writers, in proportion, now than formerly, who have the entire management of large estates. There are gentlemen in that department who give advice to proprietors of lands; and the writers have less of immediate superintendence, though they still may continue to be the agents of the gentlemen. There are also a good many students of Divinity who occasionally attend. In that large summer class before alluded to, perhaps the names of students of Divinity may have been marked down; but in general, I give them tickets, without putting their names into the list of students.

Without exacting any Fee?—If I know that they are students of Divinity, I never have taken fees. There are also several attending the class for Agriculture, who are only occasionally, or for a short time, in town. A gentleman in the country perhaps wishes his steward to hear the lectures upon a particular class of subjects; for example, some upon Fallow-crops, others upon Drainage, and others upon Live Stock; and when such come in for three or four weeks, I always make them welcome to attend.

Do you think it desirable that attendance upon your class should be required, as a part of a liberal education?—No, I should hardly think so; not for Masters of Arts, or anything of that kind. There are several young persons attending the class, that have not what I should reckon requisite to understand even part of the discussions. Some of them have not attended Chemistry and Botany; and I should think that those branches of Science would be requisite for any person wishing to understand Agriculture in a full and proper manner.

To what circumstance do you attribute the decrease in the number of Practical Farmers?—I think it is owing partly to the circumstances of the times. There are many that have spoken to me, when I met with them in the country, of their intention to send their sons to the class, but, from the change in the condition of the tenantry of late, they put off doing so. That thinner attendance is the case, I understand, with almost all the other classes; but very likely, as to Agriculture, it may arise, in some instances, from my telling them, that it was hardly worth the expense of their staying in Edinburgh for it, singly.

Are persons of that description capable of fully understanding your Lectures?—Yes; I never found any but what were fully capable. They should, before attending me, know something about practical affairs; though I very often begin minutely about the structure of implements, and give minute details respecting tillage. I do that more for the sake of gentlemen attending, than for the sake of farmers' sons; for I never saw a farmer's son that did not perfectly appreciate everything I said.

Without a previous knowledge of Chemistry?—I am talking of Practical Agriculture. With respect to the detail, as to the composition and character of soils, they could only very imperfectly follow that. They know, however, that mould is a decomposable material; how it could be accumulated, and how vegetable remains could be turned to manure, without knowing anything about the finer opinions on the subject of Agricultural Chemistry, delivered by Sir Humphrey Davy and some others. Indeed, I do not take much pains to explain theories, except in a few instances, to guard against erroneous practice resulting from some of them.

In treating of Soils, and of the effect of different species of Manure on soils, how do you

University of Edinburgh.

Professor Coventry.

25 October 1827.

proceed: Have you specimens of different soils, in order to explain them, or do you take your pupils out into the country?—They all understand that ordinary farm manure is composed of common dung and straw, and they have all seen lime. I sometimes show specimens of different marls, and also of different limestones.

Not of Soils?—Not any farther than when I sometimes show the mode of examining soils; as by the very simple way of their deflagration with a portion of fused or melted nitre, and by the use of the common acids, in detecting any portion of the carbonate of lime in them. That matter they all come to understand very soon. I find, however, those chemical details far less useful, than trying to make them understand the general rules for best managing a farm. I have always been of opinion, that a small alteration in some of the clauses of leases would make a greater improvement in the country than all the improvements in implements, or even in Chemistry, as connected with Agriculture, which have been made since the days of Hesiod, or of the earliest writers *de re rusticâ* among the ancient Romans.

Do you refer to any particular clauses?—No. I have three or four lectures upon that subject—the conditions in Leases. In some districts, farmers are so exceedingly restricted, that the very worst sort of agriculture thence prevails; while yet, by a little more liberty granted them, coupled, however, with some restraints, a much better style of culture for the landlord, the tenant, and the public, might be pursued.

Have you any farther suggestions to make, with regard to your own class?—None.

Aglianby Ross Carson, Esq., LL.D., Rector of the High School of Edinburgh, called in and examined.

Dr. A. R. Carson.

How long have you been Rector of the High School?—Since September 1820.

The system of Education there comprehends both Latin and Greek?—It does.

At what age do boys generally leave the High School?—At about fourteen, upon an average.

Those intended for College?—Those intended for College; they generally enter about eight, and remain six years.

What extent of knowledge of Greek do they generally possess, at the time they leave the High School?—I can state the books they have read: they have learned Grammar, and then proceed to the Greek Testament, and read a portion of it, more or less; it is impossible to define the quantity exactly. They then take up Xenophon, or instead of him, the Collectanea Minora, and read generally, in the course of the two years, the whole of it. The higher class of Greek reads usually part of Thucydides, Xenophon, Herodotus, or Demosthenes, and at least two Greek Plays.

How many hours a-day are dedicated to this?—The higher Greek class attends twelve hours a-week; the lower Greek class eight hours a-week.

Supposing a greater knowledge of Greek shall be required, would there be any difficulty in supplying it at the High School?—No; but I do not see, unless pupils stay longer, that it is possible to add more Greek, without encroaching upon the Latin: but we are now beginning to teach Greek a little earlier than we used to do, and in that way, perhaps, more may be done; at present portions of almost all the higher Greek authors are read.

Would the young men remaining longer at the High School, be attended with any public inconvenience?—No. There is a provision in the High School, for boys attending seven years, which is the utmost length of time devoted to Classics in the schools of this country.

Do you consider the continuance of the practice of teaching the Elements of Greek in the University, to be at all necessary for young men educated at the High School of Edinburgh?—No, not for young men educated at the High School. There always are, however, boys in the lower part of every class, of whom it is difficult to say where they should be educated after they leave the High School; for they know very little, and they never will know much. Those might go over the Grammar again at College; but I do not see that they would gain anything by it, because they are always boys of whose proficiency there is very little hope.

Have they all had an opportunity of acquiring it at the High School?—Yes.

Do you consider the continuance of the practice of teaching the Elements of Greek, to be necessary for lads that are educated generally at the other respectable Academies and Schools in this town?—I believe those are always prepared for the University; they have, generally speaking, followed very closely the practice of the High School.

Supposing that practice of teaching the Elements of Greek at the College done away with, what effect do you think it would have generally?—I do not know; I am afraid it could not be done, under the present circumstances of the country, till you can create a new class of Schoolmasters over the whole country; I believe a great many of the Schoolmasters are not able to teach Greek.

Do you conceive that, in all those schools where the parochial Schoolmasters or others are able to teach Greek, that the Greek would be taught, if the Elements of the Greek language were not taught in the University, and if a greater degree of knowledge of Greek was required, before the young men were allowed to enter the University?—I should think that very probable; the one would result, as a natural consequence, from the other.

Is it your opinion that any considerable proportion of the Teachers throughout the country, where there is any encouragement given to them, are not able to teach Greek?—I believe there is a very considerable number that are not qualified to teach Greek.

If a knowledge of Greek was required, do you think there would be any difficulty in supplying Schoolmasters, particularly parochial Schoolmasters, in Scotland?—It depends upon the encouragement that is given. The encouragement in many parishes must be increased, or men qualified to teach Greek will not be found to fill up vacancies when they occur. A

University of Edinburgh.

Dr. A. R. Carson.

25 October 1827.

man who has had an Academical education can scarcely be expected to devote himself to teaching, unless the encouragement be increased.

Do you think that persons, capable of teaching Greek, would be equally disposed to undertake the teaching of the lower branches of education, which must be taught in the parish schools?—I should think that, from the small number of Classical pupils they generally have, the teaching of Greek could hardly encroach upon the ordinary business of the school.

Is it your opinion, in general, that the attainments of the Schoolmasters throughout the country are of a higher order than they were in the times of your early recollection?—Yes; I think they are improving, but I do not think great improvement ought to be expected, or the attainments of Schoolmasters raised much higher than they are, unless they are better recompensed than they are at present. I am quite sure that the general system of classical education in Greek and Latin, in the towns particularly, has improved within the last twenty years.

From your knowledge of the different Grammar Schools in most of the principal Burghs in Scotland, do you think that the scholars coming from them might safely be required to enter a Greek class in the University, where the Elements of Greek were not taught?—Unquestionably.

Then it would be solely for those whose education was entirely obtained in the country, at parochial schools, that you would think some additional preparation necessary?—Yes.

Is it your opinion that it would tend to increase the average attainments in the Greek language, by exciting a desire to prosecute it farther, if the Elements of Greek were not taught in the University, and a certain degree of knowledge required before young men were allowed to enter the Greek class?—I think it would increase the average attainments in the Greek language.

Do you think that young men, coming from such parts of the country as do not furnish the means of teaching the Elements of Greek, might derive greater benefit from attending a Grammar School in one of the principal towns, where Greek is taught the whole year, than they can be expected to derive from attending upon a six months' course in the University?—There can, I think, be no doubt of that.

Do you think that such a practice would be attended with any great hardship upon the young men in the rural districts of this country?—In some cases it might; in others it might not. It very much depends upon the situation of a parish, and the near vicinity of a town.

Do you consider the young men, when they quit the High School here, to be of sufficient age and steadiness to attend College usefully?—Yes, I think the general average of the class are.

Do you think it would be a preferable system, even supposing them to enter the College, if they were to attend the Rector of the High School an additional year, in order that they might be continued a year longer under the stricter discipline of the School?—They would not gain much by it. I do not think there would be much difference between the High School and College, at that period of a boy's progress, except in so far as the High School session is longer. There might be a little difference in respect of discipline; but I conceive that an active Professor would enforce nearly the same discipline that is enforced in a well-conducted School.

Do you think there is any disadvantage in their being relieved at an early age from attendance during six months of the year?—That is certainly an objection. I think that is the great objection to removing young men early from the High School, that they are taken from a course of ten months, to one of five or six months.

Do you think it would be an improvement, if the Language classes in the University were to meet nine or ten months in the year?—I should think it would be a very great improvement; but I believe also, that they would be attended by few pupils from the town, and none from the country.

Without any reference to the merits of individual Professors or Teachers, is it your opinion, generally speaking, that a very considerable number of young men who are taken away from the longer attendance at the Schools, and who pass perhaps only five or six months at College, without any very strict discipline, are very apt to lose considerably in Latin and Greek during the first year or two of their attendance?—It is very likely, from their short attendance. I should conceive that the discipline of a College ought to be very much the same as that in a School; and if the discipline be the same, I can see no difference, except in the time of attendance.

Do you think that the tasks are as well prepared by the young men attending the College, as they are by the young men attending the High School?—If the same means are employed to enforce preparation. I do not refer to that discipline which consists in flogging: that is not resorted to in my own class; but there are other means used to enforce the preparation of lessons, and these might be employed as well in the College as in the High School.

Is not the practice of gaining places a very useful incentive, and would it not be found such for a year or two longer than the young men continue at the High School?—It is certainly very useful, and would unquestionably continue to have a very good effect, for one or two years longer than young men continue at the High School.

You are aware, of course, of the more limited number of hours of attendance at the College, even during the sitting of the College, as compared with the High School?—Yes.

With respect to such young men as come from the country, who have learned no Greek at all, is it your opinion, that although entered as students of the College, it would be better that they should attend one of the Masters of the High School for that purpose?—I am afraid that would not do very well. Young men from the country are generally grown up lads, who would not willingly associate with the young boys in the school. The young men who come from the country, are generally three or four years farther advanced in life than the

607

University of Edinburgh.

Dr. A. R. Carson.

25 October 1827.

pupils of the High School, who are beginning the study of Greek. It would be better, perhaps, to have a separate Teacher for those.

What College did you attend?—The College of Edinburgh.

You are aware of the length of the session of the College of Edinburgh?—Perfectly.

Does your information afford you any grounds for forming an opinion, as to whether any inconvenience would result from a longer attendance, arising from the circumstances of the students?—If longer attendance were required, many of the country students would be excluded from the advantages of academical education. I know that many of the lads who come from country parishes, have not the means of attending longer.

Are you of opinion that the same attendance as exists at Edinburgh College, might be generally required throughout such of the other Universities where the sessions are shorter?—Unless there are particular circumstances, of which I am not aware, the same time might be spent at other Colleges as here; and I believe the session in all our Universities to be nearly of the same length.

Can you give the Commissioners any information as to the actual amount of expense that a young man attending the Divinity class may be exposed to, in the course of a session at Edinburgh?—No; I could not now state it very exactly.

At the time you were attending College, what do you suppose might be the expense of a Divinity student?—A Divinity student, who attended nothing but Divinity, had no class fees to pay; I think, at that time, he might have lived for £12 or £15 during the session; that is now thirty years ago. He must have lived very frugally, however, to require no more.

Have you not reason to think that he could live at the same expense still, as the articles of life have not risen?—They have not risen much; but room-rent may have risen. I do not know at what rate a lodging may now be hired.

Do you conceive that a regular attendance for several sessions might be safely required from the students of Divinity, without bearing oppressively upon any considerable proportion of them?—If young men are living in families, they may be residing in the country, and it is impossible for them to attend during the winter.

Supposing the effect to be merely to postpone the period at which they would look out for situations as permanent tutors: would there be any other objection to it?—None occurs to me.

Do you think that the greater proportion of them could attend regularly for several sessions, seeing they have all attended the Language and Philosophy classes for four or five years?—I know that a great proportion of the Divinity students are in very poor circumstances; and after four years' attendance previously, their funds are generally very much exhausted, by the time they enter the Divinity Hall.

Do you think it desirable that a much greater number should attend the Divinity Halls, than can have any reasonable prospect of being provided for in the Church?—If the best were always selected, to fill the Churches, the greater number affords ampler scope for selection. In any other view, it seems an evil that more should be educated for the Church that can be provided for.

Is there not some reason to apprehend, in point of fact, from the great number attending the Divinity Halls in Scotland, who are not able to obtain situations in the Church, and who are obliged, of course, to look for other situations, that the character of Divinity students, in fact, suffers in the estimation generally of the country?—I am not aware of any such effect being produced.

Do you think it desirable that the same elementary books should be used in all the Universities for the classics?—I think it would be highly advantageous, particularly for Greek. In fact, the same elementary books are decidedly fixed in Latin already; but in Greek they are constantly undergoing change. Every University has, in some respects, a grammar of its own, and the same may be said of almost every school. The consequence is, that when pupils come to College, the Professor must abandon grammar entirely, or accommodate himself to all the ever-varying works on this subject that may happen to be put forth: this he would find impracticable.

What Grammar do you use?—We use Moor's Grammar. We have lately, with the concurrence of the magistrates, fixed upon a particular edition of it; but there is at present a question at issue, whether we shall continue to use that edition or not. One of our principal reasons for using Moor's is, because it is used in the University; we think it right to teach the same book.

Do you think, upon the whole, that the young men now generally coming from the High School, and from the different towns in the country, to the University, have more knowledge of Greek than they had previously when you were going?—They have much more knowledge now than they had twenty or thirty years ago.

So that there has been a considerable improvement, in that respect, within your recollection?—There has; and, I believe, in no place more than in the High School itself, where Greek was scarcely taught thirty years ago.

Is it required of all the lads attending your class, that they should learn Greek?—No, it is not; it is optional.

What proportion may learn Greek?—Of 140 boys, I think I may say, with safety, that 120 learn Greek; and so on in proportion.

Does your class embrace all the older description of boys attending the High School?—Yes.

And they pass from the other classes into yours?—From the fourth class.

How long do they generally remain in your class?—Generally two years, some three, and a number of them not more than one.

Are those that remain the third year, sent back for the purpose of making up time that has

University of Edinburgh.

Dr. A. R. Carson.

25 October 1827.

been lost, or do they read higher works?—They do not read higher works; they read the same authors with the rest of the class of which they form a part; but I make it a point to vary the course, so that they shall never read the same thing twice.

Then the third year is chiefly intended for those whose parents think they have not made progress enough?—Yes; it depends altogether upon the pleasure of the parents.

Do you think that another year might be profitably employed in the same way?—Another year's attendance would demand an additional teacher, who would in all probability never have so many pupils as to afford him the means of subsistence. However profitable it might be, it would for this reason be impracticable.

Is it a common practice for boys, who are to be apprenticed to Writers to the Signet, to leave the High School without having attended the Rector's class?—It has frequently happened; I cannot say that it is a common practice; I should think a great majority finish the usual Curriculum of the High School; but it is not uncommon for young men who are to be Writers to the Signet, to leave it at the end of the fourth year, or even at the end of the third, merely because they are obliged, by the regulation of the Faculty, to be two years at the College.

Then, in that case, they can finish their education at the College, at the same time that other boys leave the Rector's class?—Yes. Their regulation would be good, if they had made it imperative on their apprentices to finish the full Curriculum of Classical study in the school where they happened to be educated, before entering the University.

Such boys, it is presumed, you consider as very ill qualified to attend College?—Not well qualified. It no doubt often happens, that a boy, from the top of the third class, is better qualified to attend College, than a boy from the bottom of mine; but if no definite term of school attendance be required, it seems at least reasonable that a young man who enters the University at the end of his third or fourth year, should have his fitness to do so determined by a previous examination.

Edinburgh, Friday, 26th October 1827.

The SOLICITOR-GENERAL in the Chair.

Daniel Ellis, Esq., F.R.S.E., called in and examined.

D. Ellis, Esq.

26 October 1827.

The Commissioners are desirous to be favoured with any suggestions which it may occur to you to make upon any subject connected with the interests of Education and of Science in Scotland?—I can hardly take upon me to give any information; but any question that may be asked of me I will endeavour to answer.

The Commissioners would be glad to have the benefit of your views with regard to the management of the Museum of Natural History in the University, and the use that Scientific people might, without detriment to the Collections, be allowed to have of them?—I am afraid I cannot say anything that would be very satisfactory upon that point. I have often heard it regretted that the Museum is not sufficiently open to the public; but I have heard it also stated, that there are reasons which render it impracticable to make it more so, at present.

Connected with the want of funds, or with any supposed risk of loss or injury to the specimens?—With the necessity of making somewhat by the exhibition, so as to aid in defraying the expenses of the Collection.

It is understood, generally speaking, that Scientific people have not the full use of the Museum?—I believe it is considered that the tickets of admission are very high, and that it would be a great accommodation to Scientific people in general, and not diminish the revenue derived from admissions, if the ticket was reduced to one shilling instead of half-a-crown; I have heard, in private conversation, the subject discussed, and that opinion expressed.

It is understood that no persons are allowed to draw, even upon obtaining such tickets of admission?—That I am not very able to speak of. I have heard it objected, that gentlemen, unless they have attended the class of Natural History, are not enabled to obtain an *annual* ticket; but, not having paid particular attention to these points, I speak with great diffidence.

Have you at any time made use of the Museums in other parts of Britain, or on the Continent, for the prosecution of Science?—Only as an occasional visitor, and certainly they are all very much more open to the public than is the case here.

Do you understand that, generally speaking, in most Museums, permission is given to gentlemen, prosecuting Scientific pursuits, to make drawings of such Specimens and such articles as they may wish?—I am not able to answer that question. I have understood that formerly it was refused at the Hunterian Museum in London; but I believe some change has taken place with respect to the Anatomical Preparations chiefly. I think I understood it was refused, at one time, to allow drawings to be taken; I think it was Dr. Thomson that mentioned that to me.

Do you understand that permission is freely granted at Paris, in the Jardin des Plantes?—I should conceive so; for the Museum is there completely open at all times. I have attended some occasional Lectures there, in the different departments of Natural History; both males and females were assembled there, without any restriction.

Do you conceive that a very moderate portion of attention, on the part of one or two Assistants, might very easily prevent specimens being injured, if they were taken out for the purpose of being drawn?—I should imagine so. I think the exclusive system that has been adopted in some measure in England, as well as here, has rather operated to increase the disposition to injure and destroy; and that, were a more liberal system pursued, the visitors would take an interest in the thing.

You think they would feel more individual interest in the Collection they were permitted to use?—Yes. I was very much struck, on the Continent, particularly where there are the most

splendid specimens of the Arts, as at Rome in the Vatican, to see, on Thursday and Sunday, the very lowest dregs of the people passing through the most magnificent apartments freely, without offering to touch anything. There were persons stationed here and there, certainly; but every one had free admission for certain hours of the day. I must say I felt some degree of chagrin on comparing the close system pursued here, with the liberal system adopted on the Continent; but almost all the Museums and the establishments in this country are upon a footing entirely different from those on the Continent; everything almost is made the property of the Government there, which it is not here, being the property rather of public bodies, though Government here also contributes largely.

Might not Birds and Animals be drawn, without the slightest injury to the specimens?—I should think, under proper regulations, it might be done. I have seen several times, at Florence, some of the finest pictures in the gallery there taken down and placed by the window on a stand, and persons sitting and copying them under proper regulations; and I should think, therefore, there could not be more chance of injury to subjects of Natural History than to those very fine paintings.

In the study of Minerals, it is presumed that it is of great importance that opportunities should be allowed of examining and of handling minerals, besides seeing them merely under glass cases, for the purpose of ascertaining their properties?—I rather suspect that that could hardly be granted, except under very peculiar regulations, for minerals. Some minerals would be apt to suffer very great injury in handling. Persons very skilful and very curious might certainly handle them without injury; but I am afraid that could not be allowed to any great extent.

Is there any considerable portion of minerals to which that observation would apply?—There are many minerals of which the texture is exceedingly delicate; others of which the lustre is such that it might be injured by the touch; and others are so curious and valuable, that, unless in the presence of proper persons, it would not be safe to allow much examination.

Might not a written receipt answer the purpose?—I believe that possessors of minerals are sometimes very desirous to add to their collections; and there are very curious stories told, which induce me to think it would not be safe to allow of their inspection, except, like the coins in the Bank of England, in the presence of proper persons.

Are there any additional Professorships, or any different distribution of subjects, connected with the various departments of Science, which you conceive might be advantageously introduced into this University?—I should think that some addition to the *Medical* classes might be advantageously introduced. A Professorship of Surgery, I should think, would be useful, as distinct from Anatomy. Certainly, the science of Surgery is of that great extent and importance, that no mere Anatomist can properly treat of it, especially of that part which is called *Medical* Surgery; which, though the least imposing, is the most important. An Anatomist, I conceive, can only exhibit, on the dead subject, the parts which are subject to operations, and the modes of operating; but that forms only a small portion of the science of Surgery.

Are there any other Chairs which you think it would be advantageous to establish?—I should think that some regulation as to the teaching of *Clinical* Medicine would be very desirable. I must observe, that I have never regularly attended any of the Medical classes in the College here, but those of Chemistry and Botany; but I have attended most of the Philosophical classes, and I have associated a good deal with the students during the twenty-five years I have lived in Edinburgh, and have generally known what was going forward in the opinions of the Medical Profession. I have also occasionally gone round the wards during the Clinical visits; and, certainly, I did not think they were conducted in the way that was most useful, either to the patients or to the students, nor that the science of Clinical Medicine has been sufficiently attended to in this University. It appears to me that, next to Anatomy and Chemistry, which give the most essential principles of Medical science, Clinical instruction, properly conducted, is the most important part of a Medical education.

Will you have the goodness to state the improvements which you think might be introduced into the manner in which the Clinical Lectures are given?—I have not considered the subject sufficiently to venture to suggest such improvements.

What are your objections to the present system?—I think the mode of conducting the Clinical practice is, at least it was—(for I have not seen it for some years, not having that general acquaintance with the students now that I had formerly, when I associated with them a good deal as a member of the Medical Society)—very defective. It struck me as a defect, that when so great a number of students were at once going round to see a case, the Professor and the Clerk, and a few students only who got round the bed, could see the patient, and the others must remain distributed about the room. These latter never, perhaps, saw the patient; they only heard the symptoms called out, which they noted down, and they had access afterwards to correct their statements, if they chose, by referring to the books. Looking, however, upon Clinical instruction as that part of Medical education which combines the Theory of Medicine with its actual Practice, in observing and discriminating symptoms—as that sort of knowledge which can only be obtained by the use of the senses, I conceive that little or no benefit could be derived to the students generally from the mode in which it was then studied.

Then you think that an additional number of wards would be useful?—I should think so. When I was on the Continent, I did not go with professional views at all; but I rather think that, generally speaking, Clinical instruction is much more attended to on the Continent, and more particularly of late years, since that part of Medical study called Morbid Anatomy, or the examination of the morbid state of the organs affected, has risen into so much importance. This it had not done to the same extent in my early period of study, and it now renders it of more importance to have Clinical instruction more assiduously cultivated, and not taught to such crowds at once.

University of Edinburgh.

D. Ellis, Esq.

26 October 1827.

Do you think it could be best managed by one or two Professors, or by a rotation of Lecturers?—If by a rotation, it ought to be a very long one; but I should rather think that a fixed Professor would be of great advantage. The Science of Medicine, advanced as it is, is yet in so imperfect a state, that if a number of persons, except in rare cases, were called successively to the same patient, almost every person would be apt to give a different opinion of the disease. With respect also to the modes of treatment recommended under such circumstances, if the rotation of Physicians were rapid in its occurrence, no system of treatment that might be laid down by one Professor, would be pursued probably by his successor to that extent necessary to enable the students to form a just judgment upon it.

And there might be a confusion in practice?—Yes, and a jealousy perhaps even among the Professors themselves. I believe that, on the Continent, the Clinical Professor's is generally quite a distinct Chair.

In that case, would you propose that a greater proportion of time should be given up to the attendance in the Hospital than one hour?—I should think there should be more time given to the Clinical department; and that, in some way (how it could be best managed, I am not sufficiently acquainted to say), the Professor should perhaps visit the patient only with a certain limited number of students, who would not be so likely to disturb the patient, and by which means the students themselves would obtain that ocular information, and receive those practical remarks of the Professor, which cannot be expected when the crowd is so great.

In such wards as exist in the Royal Infirmary, what number of students do you think could attend, so as to receive the benefit that ought to be derived from Clinical Lectures?—One could not perhaps confine the number within very precise limits, but I should think somewhere from ten to twenty might very advantageously accompany a Professor, under due regulation, to visit a patient; and that they might then obtain the information which an actual view of the cases would give.

But you think that more than that number could hardly derive benefit?—I should think a greater number would be likely to create considerable disturbance to the patients, without proportionally benefiting the students.

Then you conceive that so great a number as 100 or more can receive little benefit?—I should think that they can derive but comparatively little benefit, with reference to that practical sagacity which is obtained only by actual observation of the disease: when the crowd is so great, they have not the means, and therefore do not feel that individual interest to obtain precise information, which a smaller number would most likely be emulous to obtain.

Do you think that the crowd tends to impede the recovery of the patients in some instances?—Under some diseases, and states of disease, I should conceive that it must do so.

Are there any other improvements in the system of Medical instruction in this University, that you are prepared to suggest?—It has sometimes occurred to me, in some years, to have introductions from the friends of various young gentlemen, coming from various parts of the kingdom to this University, and I often have found that they had not any clear notions of the Course of Study they ought to pursue, viz., the sort of way in which the study of one subject would best prepare them for the study of another. A few days ago, a young gentleman called on me, who seemed to have no distinct idea what classes he should first attend. I told him, "Your first business should be Anatomy and Chemistry; those are the foundations of all the scientific parts of Physiology and of Physic, and are the things most important thoroughly to learn." I think, therefore, it would be useful if some plan or rule was prescribed, some fixed rule, perhaps (adapted, however, as far as may be, to the circumstances of gentlemen who have attended Lectures in other places, and subject to a certain discretion in the Professors), by which every gentleman should know how the different branches of Science, that he is obliged to learn during the years he is here, can best be taken up, and followed out, so as properly to succeed and mutually illustrate each other; for, certainly, if a young man begins with some departments of the Science,—for instance, with Materia Medica, before he has learned Chemistry, and some parts of Natural History,—he throws away a great deal of time in acquiring only a very confused notion of the subject. I think, therefore, it would be very desirable there should be some fixed mode of ordering the course of studies, adapted to the varying circumstances of previous instruction under which young men visit the University. There are occasionally a few old practitioners, who of course come here well informed upon different subjects; and variations in any prescribed course of study may be easily made with reference to them.

Do you conceive that the system of tutors might be advantageously attached to this University, either for Medical instruction, or for the general instruction of the students?—I am not so well acquainted with the system of the English Universities, and the benefits of that precise mode of instruction, as to be able to give the required opinion. I should think that Examinations by the Professors, which are not much in practice here, but merely optional, would in some measure supply the place of that sort of conversational style of education which tutors adopt; and also that the gentlemen who assist students in their studies, vulgarly known here by the name of Grinders—a very useful and intelligent set of men, from whom, I believe, many students derive a great portion of their knowledge—I should think that, under proper regulations, they might be very usefully employed, and considered as tutors.

Are there any other observations upon the Medical School, that it occurs to you to suggest to the Commissioners?—I am not aware of any.

You stated that you had attended most of the Philosophy classes in this University; can you suggest any improvement in regard to them?—I attended Natural Philosophy under Mr. Robison and Mr. Playfair, and Moral Philosophy under Mr. Dugald Stuart. I certainly think that these classes do not obtain sufficient attention from the Medical students; that many young men come here, not sufficiently advanced in Literature or Science to enter with

advantage upon their Medical studies; that at present the Sciences of Chemistry and Physiology are so advanced, and are acquiring such precision, that a certain degree of knowledge of Mathematics is of very essential importance, and that it is not possessed by many of the students. If they have to study the Classics, and to acquire Mathematical knowledge, at the same time that they are attending their Medical Lectures, of course it so far encroaches upon the time they would otherwise dedicate to that object. It appears to me, that that knowledge ought to be *previously* obtained, and no doubt the regulations, introduced of late in the new Academy, which combine with Classical knowledge a certain degree of elementary instruction in the Mathematics, will hereafter send the students at sixteen years of age to the University (and, I believe, the same system is to be introduced in the High School) in a much better state of preparation for professional study than has been previously the custom.

Are there any additional Chairs in the Philosophical department, that you conceive to be necessary?—I do not recollect any; but if, in the Scientific department, some of the branches of Natural History, for example Zoology, were taught ably and properly, together with Comparative Anatomy, in a separate class, I should suppose it would be very useful. Certainly, the class of Natural History, as at present constituted, embraces too much: it takes in the History of the whole of Nature.

Would you propose to include such a class as that in the Curriculum for Medical studies?—That would depend upon the time that was devoted to study at the University.

Supposing four or five years to be devoted to those studies?—I cannot exactly say how far many of those things, which are in themselves desirable, could be introduced with advantage, without interfering with other subjects of more importance.

With reference to the subject of Examinations, do you conceive that full benefit can be derived from the Medical classes, by the students attending a great number of classes in one year, running from lecture to lecture without any Examinations, and without the Professor being at all aware of the progress the students are making?—I think that their acquisitions so made must be very superficial and very confused.

Do you think that it would be better, by introducing the system of Examinations, practically to limit the number of classes that a student can attempt to take in one year?—Yes, especially in regard to the more important classes, which are the foundation of the Science. Supposing a competent degree of Literature and of Mathematical knowledge obtained—the most important subjects, as the foundation of the Science, I conceive to be Anatomy and Chemistry; that these cannot be too thoroughly acquired; and that, when they are once obtained, all other necessary branches are, comparatively, easy of acquisition, and will be well understood by the students.

Do you think that Examinations might be safely introduced into those classes?—I should think into those classes particularly; and, from the necessity of a thorough acquaintance with those two Sciences, it would be very desirable.

Do you conceive that the institution of any supplementary class of Practical Chemistry would be of importance?—Both Anatomy and Chemistry are sciences that must be practically worked at, in order to have any very accurate knowledge of them; and when the student is following the ordinary course of Chemistry, which is so very ably and so very fully delivered in this University (I suppose it to be, for students, the best course of Chemistry delivered in Europe), certainly it would be desirable that he should himself, either privately or by the rules of the class, study Chemistry practically; for his notions of the Science must be very loose and general, without some degree of practice. I do not mean that he should follow out a minute analysis of any mineral or other substances, or anything of that sort; but that in those parts of Chemistry, such as treat of heat and the gases, which are immmediately connected with Physiology and the Science of Medicine, a little *practical* knowledge of them would be very desirable, and greatly aid a just conception of their nature.

It is understood that, on the Continent, a great number of the Apothecaries are themselves skilful Chemists, and have students frequently working in their Laboratories; do you attribute to that mode of instruction, in any degree, the superiority of the foreign continental Chemists, or the greater number of good Chemists on the Continent?—I am not well informed of the state of Chemical Science on the Continent, in its minuter parts. I merely know its general features, and the names and characters of the more scientific Chemists; but as to Chemistry, as a Practical Science, diffused through the Medical profession, I am not well enough informed respecting it to answer that question.

Supposing there should be some division of the subjects of the class of Natural History, do you conceive there is any objection to there being a regular and complete Winter Course, embracing Zoology and Comparative Anatomy, and perhaps Mineralogy, if it could be undertaken; and leaving the remainder of the subjects of Natural History for a Summer Course?—If such a separation were to take place, whether such Lectures could be followed through the Winter, with a due regard to the other Lectures which the students would have to attend, I am not able to say; but I think that Zoology and Comparative Anatomy would form abundant matter for a very interesting course of Lectures.

Do you consider that the period of time devoted to the study of Botany, considering that it is required in the Curriculum for the Medical study of those intending to take a degree, is sufficient for the full instruction of the students?—The Science of Botany is rather peculiarly circumstanced. Formerly it was of very limited extent, and was in the hands mostly of Medical men; and a great number of vegetable substances formed those parts of the Materia Medica which are not now in use. The vegetable substances which now form essential parts of the Materia Medica, are very few, and Botany, consequently, is not of that importance in Medicine which it was considered to be at an earlier period. Still, as a branch of Natural History, and more especially as connected with the functions or physiology of

University of Edinburgh.

D. Ellis, Esq.

26 October 1827.

Vegetables, it is a most interesting part of Science to the Medical student. I should conceive, however, that if pursued to any great extent, it would, from the vast range the Science has taken, interfere rather too much with the other studies of more immediate use, which are to be attended to during the limited time devoted to a Medical education.

Do you think the Summer Course is adequate in point of length?—I cannot venture to say whether that may be the case or not. I do not know what acquisition is made during the Course; but an extensive knowledge of individual plants is certainly a very laborious acquisition, and is enough of itself to occupy a great extent of time.

You state that you have had occasionally means of knowing something of the habits and circumstances of the Medical students that have been attending this University; do you conceive that, generally speaking, an attendance upon a more complete Curriculum would be considered oppressive by any great proportion of them, or do you believe that the greater number of them obtain additional instruction, beyond the present Curriculum in the University, at private Lectures?—The students, besides the Lectures which they are obliged to attend within the College, do many of them attend private Lecturers, when those Lecturers are men of talent, and render their courses of Lectures interesting. The late Dr. Barclay used to give separate Lectures upon Anatomy and Comparative Anatomy, both of which, I believe, were very well attended. The late Dr. Gordon was also exceedingly well attended, when delivering separate courses of Lectures both upon Anatomy and Physiology. There can be no doubt that, where the Lectures are interesting in themselves, and ably delivered, the students would not find it a hardship to attend them within the College, more than without its walls.

Then, is it your opinion that, of the students attending this University, and going through their course of Medical studies here, a very great proportion do actually attend more Lectures than those that are included in the Curriculum?—I should think there are very few gentlemen among those who graduate now, that do not attend Dr. Thomson's Lectures, which certainly have an interesting character. It would be thought that they did not avail themselves of the advantages which Edinburgh affords, if they did not attend his Lectures, in consequence of the great improvements he has introduced in teaching the Practice of Physic, by exhibiting drawings of the effects of disease on every organ, collected at great expense and labour. He has a most extensive collection of accurate drawings of the organic affections of all parts of the human body, so that, when the description of the effects of disease is given, a figure is at the same time exhibited, representing the form, size, colour, and appearance altogether, of the parts described. In this way, the Science of Medicine is *visibly* taught, if I may say so, and young men who have not been accustomed to see diseased organs must derive vast information from it, because mere description can never convey to an uninformed person, who has never seen the appearances described, any very accurate knowledge.

Are there not likewise private Lecturers on Chemistry?—There are private Lecturers on Chemistry, whose classes are well attended in winter, and especially during the summer Course. I know that Dr. Thomas Thomson formerly, and the late Dr. Murray, were exceedingly well attended; and on Materia Medica, Dr. Murray had an additional class, exceedingly well attended also.

Would you prefer then, leaving the thing upon its present footing, allowing the students to obtain the additional instruction, beyond that which the present Curriculum requires, from the private Lecturers who may have most reputation; or, would you conceive it to be an improvement to require the additional classes and the additional attendance within the walls of the College?—I think there is great benefit in competition, and perhaps the patronage of the Chairs in the College has not been always exerted with the greatest wisdom, or in the best manner. Undoubtedly, there has been too much of *family* succession in the appointments to Medical Chairs, which has, I conceive, been a very great detriment to the University. Nothing can counteract that, and preserve a proper interest in Science among the Professors, so well as the competition of private Lecturers. Certainly, the late Dr. Barclay, Dr. Gordon, and Dr. Murray, in times when I was more familiar with those subjects than I now am, were looked up to by the students as equal to any Professors in the College; and Dr. Thomson certainly, in his department, is now.

Then you think that, upon the whole, the better plan is, without attempting to exact so much from the students as completely to exhaust the attendance they naturally will give upon Medical classes, to admit of attendance upon private Lecturers?—I should think so, with respect to Lectures on Chemistry and most other subjects; but with respect to Clinical Science, that cannot be taught privately, because it must be taught in connection with an Hospital.

Would you be inclined to recommend that additional attendance upon Lecturers upon some of the more important branches of Medical study should be required, over and above the Curriculum of the University classes?—I think, if a judicious system of *Examinations* were introduced, it would not signify, so that the privileges of the University were, to a reasonable extent, abided by, where or how a young man had acquired knowledge, or whether he had acquired it in two courses or three courses, provided the Examinations showed that he was completely informed.

Have you anything to suggest, with reference to the Examinations for degrees in this University, either in Arts or in Medicine?—I believe the Examinations for Medical degrees have, of late years, been much more strict than formerly, and I believe they are conducted with great delicacy and propriety, from what I have understood. How far any public Examinations, upon the plan of Oxford, would be an advantage I cannot say.

Do you conceive it would be an improvement if there were public Annual Examinations of the gentlemen intending to take Medical degrees, as at Paris?—I should think that it would

not be desirable to have them established universally; but that such a thing might be beneficially encouraged, and such gentlemen as chose to submit to public Examinations be allowed to have them. At Oxford, at present, I believe that it is not the students universally that are examined publicly for honours, but that any gentlemen who are ambitious of distinguishing themselves give in their names for public Examination; and, if that is done, it allows those who are either ignorant or timid to hold back, and those who are better informed, and more ambitious of distinction, to come forward.

Is it not rather the case, however, that on the present system, the Examination being at the close of the period of study, the young men are apt rather to waste their time in the first two or three years, and to endeavour to make it all up by hard labour, with the assistance of the Grinders, preparatory to the Examination?—That has been certainly the case in Edinburgh. Many young men have certainly neglected very much a regular attendance on Lectures; and have got almost all the information by which they passed for a degree from the Grinders, who have carried their system of instruction, I believe, to great perfection.

If those intending to graduate were annually examined, in some way or other, would not that tend to enforce greater attention to their studies during the progress of them?—I should think so; and especially if there were *private* examinations also, by which I mean examinations by the Professors in the several branches they teach.

Is it your opinion that the examinations might be more advantageously conducted in English, in order to ascertain the proficiency of the students—securing a knowledge of their Classical learning by some other test, or some other examination?—I should think so, because the custom of speaking Latin here is not common, even at the best Schools; and therefore, when a young man is upon his examination, and has at the same moment to think of the words he must use, and of the subject he is examined upon, it must often tend to confuse him, and render him less able to make that good appearance which he would do if the language were familiar to him. I should think that if, at the period of his first matriculation, due care were taken that he had a proper degree of Classical knowledge, examinations in English would be preferable, inasmuch as a fuller knowledge of the young man's scientific acquirements could then be obtained. In Paris the Theses are written in French, and I believe the examinations are conducted in French likewise; and in America they are in English.

Is it generally understood, among Scientific persons, that the character of the Keeper of a Museum is supposed to be at all involved in the merit of the publications, by other individuals, which may embrace any account of the articles contained in that Museum; or that he is at all responsible for the style of the drawings, or for the talent and skill of the individuals who may give an account of articles contained in the Museum under his charge?—I am not able to determine those points, nor do I know the regulations under which Professor Jameson has permitted persons to have the use of the Museum; but I should think that he would be disposed to be exceedingly liberal. The Museum is almost entirely of his sole creation; he has infinite merit in having brought that Collection together, and arranged it as it has been done; and I should suppose he would be exceedingly liberal in the use of it.

Is it understood among Scientific persons, generally speaking, throughout the world, that the character of the Keeper of a Museum suffers, if an individual publishes drawings in an inferior style, or gives an unskilful or unsatisfactory account of the specimens contained in the Museum?—I should think not, if it is done merely upon the individual's sole credit—that he does not assume any improper authority from the sources to which he is indebted, and that he does not involve the Keeper, or those who have the charge of the Museum, in any way as a party.

Whereas, on the other hand, if the Keeper of the Museum is allowed to exercise a selection of the individuals to whom the use of the Museum may be granted, practically he will become responsible to a certain degree?—Yes; but I should think that the liberty is one that, in some circumstances, should be conceded with considerable reserve and delicacy, because the Keeper himself may wish to publish authoritatively an account of the same subjects of Natural History. It would then be unfair, if that were the case, that he who collected and preserved the specimens should be anticipated by others, especially as the curiosity of the public might be allayed before his own publication could appear; but it is very difficult, consistently with what is due to the public as well as to the Keeper, to lay down rules either for one party or the other.

The Rev. *James Marshall* called in and examined.

Rev. J. Marshall.

It is understood that you studied partly at St. Andrews and partly at Edinburgh?—Yes, I attended the regular Course at St. Andrews: I was a Licensed Preacher of the Gospel before I came to Edinburgh; however, I attended two classes at Edinburgh during the Session of 1819-20: I took out a ticket for the Natural Philosophy, and also one from Dr. Hope.

Had you an opportunity of being well acquainted with the circumstances of the students at St. Andrews?—I was very well acquainted with their circumstances during the time I was there; my situation led me to be necessarily well acquainted with their circumstances; and besides, I had several intimate friends among the students, with whom I was associating almost daily.

Are you able to say what was the annual expense of a student living at St. Andrews, and attending the Philosophy classes?—The first Session I went up, I lived in a room by myself; and it was my wish, of course, being a plebeian, to be as economical as possible: I should suppose that my whole expense was not more than £15.

Inclusive of class-fees?—The class-fees at St. Andrew's are a trifle, except during the second year. My fees for the first year, for two classes, amounted to three guineas. There are two

University of Edinburgh.

Rev. J. Marshall.

26 October 1827.

descriptions of students at St. Andrews, Secondars and Ternars: a guinea and a half is the fee for the Ternars.

Did the £15, then, include the class-fees?—I dare say the whole expenditure, the first winter I was there, would not much exceed £15, fees included.

Did the term extend from the first week in October to the first week in May?—Yes, the examinations were in the first week of May; the first classes meet, in St. Andrews, at the end of October, when the Professors get their pupils arranged, and the classes formed; and the College sits down regularly on the first Wednesday of November.

Do you remember any instances of students leaving the College before the termination of the Session, on account of the difficulties under which they laboured?—I never heard of any such instance. I have heard of some instances of students being said to be in difficulties; but that any one was absolutely compelled to leave the College, I never heard.

Then you do not think that a session of six months and a half occasions any serious hardship to the students in general?—I do not think that it does. There are many very poor lads among them; but still they contrive, by having Bursaries, and perhaps some of them by having a little private teaching, to spend the six months.

Is it your opinion that a student might contrive to live at Edinburgh at nearly the same expense as at St. Andrews?—I am of opinion that, were the room rents at Edinburgh as moderate as in St. Andrews, a student might live at nearly the same expense; but the class-fees at Edinburgh are much higher. I suppose that a room at St. Andrew's, which would be got for a Session, that is to say, for twenty-six or twenty-seven weeks, for the sum of £4, would in Edinburgh be charged 5*s.* or 6*s.* a-week, which makes a difference of about £3 or £4. In attending the University of Edinburgh, too, the students have an impulse to spend a good deal which is saved in St. Andrews, in the way of attending public places, theatres and exhibitions; and besides, the article of clothes is a little more expensive, particularly shoes, if the students go about a good deal in Edinburgh.

Do you conceive that, for the object the students have in view in obtaining instruction, generally speaking, they would approve of an extension of the Session, even beyond six months, to seven or eight?—I never had occasion to talk with any student upon that subject. When I was a student myself at College, the idea of an extension of the Session had not then been broached.

Did you feel yourself the want of a longer period of instruction at the University?—With respect to myself, I rather felt the shortness of the Session to be an advantage in one point of view. I made efforts, which, perhaps, I would not have made if the Session had been much longer, and I got through it from the prospect that my labour was not to be very long continued; and perhaps one consequence of lengthening the Session might be, that some of the students would not study with the same ardour that influences them at present. I recollect one winter, my third Session at St. Andrews, I laboured very hard; and I could not have continued to labour at that rate for a much longer time—I must either have slackened my exertions, or injured my health. I know that, in the Mathematical class particularly, there was a want of time felt to overtake the subject.

Would you think that, if the Session were only five months, many subjects would be very imperfectly gone through, particularly in the Mathematical department?—Certainly, there was always a want of time felt in the Mathematical class; and in the Natural Philosophy, too, many subjects were treated very imperfectly, from the very circumstance that there was not sufficient time to discuss them.

Even though the Professor were to meet three hours a-day in teaching Mathematics, do you think the students would have sufficient time to prepare their tasks, so as to acquire a sufficient knowledge of Mathematics in one Session, provided that Session were only five months?—The consequence of the students devoting so much of their time to one class would be, to draw their minds from the others—they could not do equal justice to the rest; and I think that the students at the College of St. Andrews, as it is now conducted, have labour enough on their hands, if they choose to apply to it; that more hours could not with propriety be given to the labours of the Mathematical class, or the Natural Philosophy class.

Did you experience much benefit from the use of the Library at St. Andrews?—Yes, I felt it a great source of information.

Were there any complaints, on the part of the students, while you were there, with regard to the use of the Library?—Very few, as far as I know; at least I never had any reason to know that any complaints were well founded.

Were there deposits exacted when you were there?—There were no deposits at first; the deposits began, I believe, before I left St. Andrews.

Was that system of deposits considered a hardship by the students?—I do not recollect that I ever heard any complaints.

Would you have considered it a valuable privilege, and one that you and many students would have made use of, if you had had a right to read in the Library, and if accommodation had been provided to enable you to read in the Library, books that you were not allowed to take out?—I never applied almost for any books that were refused to me; there was a number of books *veto'd*, but those were such books as that, in general, I had no need to have access to.

Would you reckon it a valuable privilege, or do you think it would be much used by the students, if they were allowed to read in the Library?—There were a few books that we could have got in that case, Lavater's Physiognomy and other books; but the Professors were sometimes kind enough in accommodating students with books which they could not have got by their own application.

Do you ascribe much benefit to the system of Examinations?—I felt it a great spur in making me prepare; there is a sort of emulation which it excites; a student who otherwise

615

University of Edinburgh.

Rev. J. Marshall.

26 October 1827.

might have prepared none, I thought, made preparation in order not to be disgraced and ashamed.

Did you see the want of a similar incentive at Edinburgh, when you attended the Philosophy classes?—My impression was, that there was really very little stimulus of that kind in the University of Edinburgh. There was no Examination in the two classes that I attended, Natural Philosophy and Chemistry; and the Examinations in the other classes, on account of the number of pupils, came so seldom, that the students, I understood, made scarcely any regular preparation to meet them.

You have had occasion, it is presumed, to be acquainted with the circumstances of the Divinity students, generally speaking, at St. Andrews?—Yes.

Did you attend the Divinity Hall here also?—No, I have not attended the Divinity Hall here.

Do you conceive that the Divinity students at St. Andrews could easily bear a longer attendance?—Yes, I think that most of them could, in respect of their circumstances; they could afford to stay longer.

Do you consider that that would be advantageous to the interests of the students themselves?—It would depend a good deal on circumstances; many of them were very idle, and there were no Examinations when I was there, with the exception of Dr. Cook, who used to examine in the Greek Testament. Discourses were prescribed to the student; if he executed them, and made his appearances regularly in the Prayer Hall, when his turn came, it was not well known, generally, whether he was a student, or whether he was an idle person.

Do you conceive that enforcing attendance at the Divinity Hall for two or three Sessions, would bear so seriously upon any considerable proportion of the students as, on that account, to be objectionable?—I rather think it would narrow the entrance into the Church; a good many who were attending at the Divinity Hall were Schoolmasters, and some Tutors in families; and they came there to deliver a discourse and attend partially; but had every one who thus attended partially, when I was there, been asked to attend regularly, I believe some of them would not have been able to do it.

Does that apply to any considerable proportion?—Not a great many; the number of students of Divinity at St. Andrews is not very great.

Do you conceive there is much difference in the circumstances of such students as come to the College of Edinburgh from the country, who have been educated at Parochial Schools, and the same class of students whom you found at St. Andrews?—I should suppose they may be pretty nearly alike.

Did it appear to you, so far as you could judge, that the circumstances of the Divinity students also were pretty nearly the same?—The circumstances of the Divinity students at St. Andrews used to be very good then; the number of attendants were very few; it has increased I believe considerably since I left St. Andrew's: most of them had Bursaries, either money or seats at the Bursary-table; but the table system is now done away, and the students are paid the value of the table. One year when I had not a Bursary, and which was the last session I was there, the value of the Bursary was nearly equal to £15.

Did you consider that sum as being of more or less value to a student than the use of the Table?—I never sat at the Table; but I would have considered it of more value than the Table.

You would have liked the commutation rather than the Table?—Yes.

Had you any opportunity of knowing whether that was the general feeling, or otherwise?—The value of the Bursaries paid in money were not always so high as £15; the fiar prices were good that year; in other years they might be less; but I should rather suppose that the students generally liked the commutation.

Had you any opportunity of knowing the circumstances of the students at Aberdeen?—No; I could not say anything but from report.

Can you state whether any proportion of the students at St. Andrew's come from the Highlands?—A good many.

So far as you could form any opinion, did there appear to you to be any real or substantial difference between the means of the students from the Highlands, and the means of those from the Lowlands?—I rather suppose they are pretty much the same.

You do not believe there is any such difference as to require a different system for the one class of students and the other?—No; I should suppose that as poor students sometimes go from the Low Country as from the Highlands.

Was there such a proportion of students from the Highlands at St. Andrews as to satisfy you that, as far as St. Andrews went, that was really the case?—That was my impression.

[*The Minutes of Evidence having been sent to the Witness for verbal correction, he requested leave to add the following Remarks:*]—

"I find that, being taken unawares, I may seem rather to have blinked some questions than given a categorical answer to them. In page 572, when asked if I thought it would be advantageous to allow students at St. Andrews to read in the Library such books as were not allowed to be given out,—my answer is not very decided; and, indeed, I am at a loss to say whether it would be advantageous or not, all things considered. I foresee that the measure would be attended with advantages and disadvantages. It is obvious, first of all, that it would be a great source of trouble to the Librarian; and the Library might hence become a lounge for boys and idlers. At the same time it must be allowed that the studious might be benefited by the measure.

"In page 573, I am questioned, if making Divinity Students attend regularly for two or three Sessions would bear so hard on them as to be an objectionable course. In answer, I allow that it would narrow the entrance into the Church; and now add, that I do not therefore assert that such a

University of Edinburgh.

Rev. J. Marshall.

26 October 1827.

measure would be objectionable, because it may be made a subject of dispute, on which there may be difference of opinion, if the entrance into the Church has not been too wide hitherto.

"To what I have said, when subsequently examined as to the comparative circumstances of students of Divinity at St. Andrews and Edinburgh, I may here add that, on account of the number of Bursaries at the former University, I consider that hitherto its Divinity students have been better provided for than those at Edinburgh. However, Edinburgh is a better field for employment generally, and therefore often preferred by students of Divinity."

Macvey Napier, Esq., Professor of Conveyancing, called in and further examined.

Professor Napier.

The Commissioners are anxious to be favoured with any observations which have occurred to you relative to the management of the College Library, and such suggestions as you can offer, for the purpose of affording a complete use of it to the students, under such regulations as might be necessary?—I felt very desirous, after receiving notice that the Commissioners were to do me the honour to examine me upon this subject, to turn my experience in the management of another similar institution, and my knowledge of the College Library, to some account, in the way of giving information, and making suggestions; but I regret that my engagements have been such as to prevent me from putting my thoughts into any shape till this morning, when I hastily noted some observations, which, if it be the pleasure of the Commissioners, I shall read. They are arranged under distinct heads.

Have you seen certain suggestions that were given to the Commission for the management of the College Library, and the remarks of Dr. Brunton and Dr. Duncan?—I have; but there is nothing of any great reach or importance in these suggestions. Nor can I agree with all the remarks alluded to; though some of them, as coming from men well acquainted with the Institution and the College, certainly deserve attention. In so far as they seemed to me of any importance, I have kept them in view in the observations which I propose to read.

"1. *General View of the Library.*—This great collection has been formed, partly of donations, partly of purchases, and partly of the supplies received from Stationers' Hall. In the earlier periods of its history, its only means of increase consisted of donations. It contains much that is valuable, and not a little that is both curious and rare; but viewed as a repertory of varied information in Science and Literature, it is defective and unequal,—its redundances in some branches being as great as its deficiences in others. It is eminently wanting in that character of generality, founded upon the possession of all that is most useful and interesting in every branch of knowledge, which constitutes the best recommendation of an extensive Library. Its most ample department is that of Medicine—a purely professional one, more largely replenished than any other with obsolete matter. Natural Philosophy and Natural History may be mentioned as tolerably supplied with the publications belonging to them. The case is very different in Metaphysical, Ethical, and Political Science. In all of them the deficiences are great; but in most branches of the latter they amount nearly to a total blank. In Classical Literature there are few great Libraries more defective. Under this head I include all that relates to the exposition and illustration of the ancient Classics—all to which a scholar, in the more enlarged sense of the term, may be supposed anxious to direct his inquiries. Its defects in this learned department cannot be considered as otherwise than discreditable to such a Seminary. The truth is, this Library has been formed, and, it is to be feared, must continue to be formed, without any plan for completing it systematically,—that is, without any regulated course of purchases, calculated gradually to supply all the more prominent and blameable blanks in the various departments of knowledge. I do not consider this evil as capable of being remedied, either by the agency of Curators, or by any system of Regulations. In as far as it can be amended, the remedy must be found, mainly, in the knowledge, zeal, and assiduity of some individual who shall make the improvement and aggrandizement of the Library an object of ambition—its character an object of fame to the University; and who shall devote to it a much larger share of time than it would be at all reasonable to expect, under present circumstances."

With regard to what you have now stated, do you conceive that the blanks to which you have alluded, in the range of the Library, are more to be attributed to the want of method and good direction in the purchase of books than to the want of funds?—I ascribe them partly to both: I ascribe them certainly in a great measure to the want of funds; but if the purchases had been steadily regulated by the principles to which I have alluded, those blanks would not be so great in some departments as they at present are.

You are acquainted with the annual funds of the Library?—Yes.

Considering what is done with the funds in other Libraries, do you conceive that there are greater blanks, upon the whole, in the University Library, than you were prepared to expect, or that there is more given up to the expense of management?—I do not think that there is too much given up to the expense of management; I believe that every shilling of the funds that could be applied to the purchase of books, has been so applied. I do not, certainly, approve of the mode principally followed in making purchases. It appears to me, that too much of the fund has been applied to the purchase of Medical books; indeed the Library Fund is administered in a way which seems to lead to that result; there is a Medical department, and a General department. There should be no such division. Every student pays equally to the Library, and I regard it as a general Institution for the promotion of Science and Literature, not for the cultivation of any one Profession, however numerous that Profession may be. There is a defect inherent in the practice of purchasing, to which the unsystematic mode of forming the Library is, in a great measure, to be ascribed. The Principal Librarian does not himself direct the purchases, or only in a very small degree. They are made at the suggestion of the Curators, and each Curator is more desirous to get the books that may be useful in his own department, than to get those that may be wanting to supply the blanks in the Library as a general collection. It is not unnatural that they should wish to purchase the books more immediately useful to themselves; but so long as every one shall view the Library in that partial light; so long as there shall be no predominating feeling that the character of

617

University of Edinburgh.

Professor Napier.

26 October 1827.

the University is affected by its completeness as a whole—books may be purchased, but a well-assorted Library will not be formed.

Would it not seem that a great proportion of the Medical students are better able to obtain elsewhere the use of the ordinary works which they require in the prosecution of their studies, than the general students are able to obtain the use of those which they require?—I cannot speak with certainty as to that. I have very little intercourse with the Medical students; but I believe there is a very good Library attached to the Medical Society, and that most of them belong to that Society. I by no means object to the Medical students having a fair proportion of Medical books; but I do not think it reasonable that any profession should expect to find in the Library the whole works necessary to the study of that profession; nor do I consider it at all proper, that purely professional books of any kind should be purchased, to the exclusion of works of general science and learning. Let him who studies a particular calling furnish himself with its instruments; let him not, at all events, be furnished with them at the expense of those whose studies are directed to the general culture of the understanding—to the acquisition of that primary knowledge which constitutes the basis even of professional pre-eminence.

"2. *Office of Librarian.*—In adverting to this subject, it is impossible not to feel that the Patrons of the University, in whom is vested the right of electing the Librarian, ought to have made some effort, by means of a more suitable provision, to render the office more efficient. The character and utility of the Institution depend essentially on the competency, the zeal, and the attention of the person by whom it is filled. It is not enough to have good Rules and Regulations. The best Code that could be devised would be of little practical utility, if not administered in a way to secure obedience to its prescriptions, and respect to its administrator. It would be in vain to expect this, in such an Institution as the University Library, without the daily presence or inspection of an officer, possessed of all those attainments, and that devotion to its interests, which would ensure to him a practical and salutary ascendency in its administration. There is, unfortunately, no adequate provision for such an officer; and to this many of the defects of the establishment must be ascribed. It seems to have been forgotten that a Library is a very essential part of a University, and that it is as necessary to provide for the efficiency and usefulness of that branch of the establishment as it is to provide for its Chairs. The example afforded in most of the great Universities of the Continent, in this particular, has been wholly without effect. There, the office of Librarian is generally viewed as of primary importance; and many of the most illustrious names in modern Literature will be found in the list of those by whom it has been held. This office will never be considered as imposing any very arduous or responsible duties, so long as it remains on its present footing. If a suitable endowment for it shall not at length be provided, either by the Patrons, or by the Professors themselves, by means of an appropriation of part of General Reid's succession, the University will have acquired little addition to its usefulness, whatever may be the case in respect to splendour, from the sums which have been so largely employed in the erection of a Library. In what I have taken the liberty to say on this head, I would wish most anxiously to guard myself against any suspicion that I have been actuated by a desire to attach any sort of blame to the present Librarians. I do not consider that there could be anywhere any rational expectation that they should devote a larger portion of time and attention than they have been in use to do to the business of the Library. If I might be allowed to offer my testimony, I would say that I believe both Dr. Brunton and Dr. Duncan have the interests of the Institution much at heart; and that I have ever found them willing to take counsel, and to give a fair hearing to any suggestions that I have ventured to offer regarding the business of this department."

Do you conceive that it would be more advantageous that the Librarian should not be a Professor, but entirely a separate officer?—I am not fond of limitations calculated to circumscribe the field of competition; for here, as in other departments, those having the choice should choose the competitor possessing the highest qualifications; but I conceive that the Librarianship being held by a Professor would be an advantage and a recommendation, the want of which could only be compensated by extraordinary pretensions. I do not consider it likely that the person in that situation, though giving daily attendance, could have the necessary authority, in dealing either with students or Professors, unless he were a Member of the University.

Then you do not consider it incompatible with the duties of a Professorship?—I certainly do not consider it incompatible with the duties of a Professorship, merely as such; for, however regulated, it would leave abundance of time for those duties; and, indeed, it has been generally held by distinguished Professors in those Universities where it has been most in estimation.

Has there been any sort of inspection of the Library, annually or periodically, by any Committee of the Senatus, to see what books were missing, or to report upon the state of the Library?—I never heard of any such inspection or periodical report; and I should fear that it would be of little practical use. I must, however, add that the Library has been much neglected. The patrons of the University, overlooking all the higher objects connected with it, have contented themselves with exacting an account of its funds. The Professors, having no means at command to improve it, do not appear to have made its condition an object of much attention; so that, till very lately, it might have been found in a state that was disgraceful to the seminary, to the city, and to the country. A great deal has been lately done, by means of a loan, borrowed on the faith of the succession to which I have alluded, towards repairing and preserving the books, and making them fit for the new apartments in which they are now placed. All the arrangements for removing the books have been well conceived, and promptly executed; and I believe that the Library, in consequence of the expenditure of that sum (about £2,000), is now in a much better state than it has been for generations.

Supposing one of the Professors to continue to be elected Librarian, might not some annual or periodical inspection, by a Committee of the Senatus, be useful, both as a check and an incentive to the Librarian?—That, I should think, would properly be the business of the Committee of Curators, supposing such a regulation to be enacted; but, though it might be

University of Edinburgh.

Professor Napier.

26 October 1827.

complied with for a season, it would be apt to degenerate into a piece of mere form. At the same time, I should think, that as the great body of those interested in the Library, namely the students, have no voice whatever in its administration—as the whole administration is under the control of a small body of men, namely, the Professors—such a regulation would be unobjectionable as a law; and if there was what I suggested in my former examination, a branch of Review in the government of this University, it would always be in the power of any Professor to procure the inspection by an appeal to that branch: without that, the regulation would not be likely to be effectual, or to remain for any length of time in observance.

Do any means occur to you, by which the students could be usefully associated in the management of the Library, or in the use made of it?—No; I should doubt the expediency of admitting them to any voice in its administration: that could not be done but by limiting such voice to the most advanced class. With regard to any use that might be made of their services, it has been stated to me, by Professor Pillans in particular, that he thought some young men fond of books could be found to assist in the Library, as Sub-Librarians, without any remuneration. That a young man or two of that description might occasionally be got, I do not doubt; but that is a felicity which, in the management of the establishment, its administrators have no right to calculate upon. There must be suitable pay, to have suitable services. The idea may have occurred to Professor Pillans, from what takes place at Glasgow, where each class has a small Library, of which the students take charge in rotation, under the inspection of the Professor. Such was the case when I attended the Junior classes of that University; and such a plan may do very well for a small collection; but if efficient assistance were to be given in the University Library, it would interfere materially with the studies of those rendering it.

Do you not conceive that it might be useful if the students were allowed an opportunity of suggesting purchases of books—either of new books or of an additional number of copies of old books, and that those should be brought periodically under the notice of the Senatus; might not that tend sometimes to bring under the notice of the Senatus any deficiencies in any particular department of Literature or Science?—I do not see any objection whatever to conferring that privilege; and some good might result from it: it would somewhat increase the trouble of the Librarian and Curators, but that is not to be put in competition with any good to be obtained. The trouble would not be great, if the students had that use of the Catalogue of the Library, to which I think they are entitled.

As one great source of dissatisfaction among the students, at all the Universities in Scotland, arises out of the management of the Library, supposing no other sort of benefit were to accrue, than to remove that dissatisfaction, might it not be worth while to try the experiment of allowing occasionlly some Committee of the students, selected from their proficiency in the different classes, to have some right to make suggestions?—I do not see how this could be well arranged in the way of Committees; and I do not know that it is a very desirable thing to encourage the formation of Committees in a University.

At present, have either the Professors collectively, or the Librarian, any means of knowing the want of an adequate number of copies of books which are much in demand among the students?—The persons officiating as Sub-Librarians must know what books not in the Library are asked of them.

Is there any system of applying the funds, for obtaining systematically a sufficient number of copies of works which are much required?—The object mentioned might in some degree be attained by requiring the Sub-Librarian to give a note, from time to time, to the Principal Librarian, of books applied for, which the Library does not contain; and by requiring the Principal Librarian to lay such applications before the Curators.

Should he not also specify the number applying for one book?—Unless he kept a list of applications, he could not state the number of applicants. The deficient supply of certain descriptions of books is one cause of complaint in this University and every other, and it is in part a groundless cause. At particular periods of the Session, the Professors in some of the classes refer to certain books; a hundred young men in consequence wish to procure a particular book; each of them comes to the Library in quest of it; ninety-nine must be disappointed, and every one is apt to grumble at his disappointment. This might be in part remedied by increasing the number of copies of some popular books, and by regulations which should enforce a regular return of books lent. I beg leave to add that, if the plan of allowing students to suggest books is to be introduced, the best way of carrying it into execution would be by keeping an *Album* in the Library, where a student could enter any book, putting his own name against it: it would not occasion much trouble to the Librarian and the Curators to examine that *Album*.

As you have stated it to be your opinion, that the Librarian ought to exercise authority over both the Professors and the students, do you understand that effectual means have actually been taken to recover from Professors, regularly, those books that they have borrowed?—Having been a Professor for little more than two years, I cannot speak to that point. I think I recollect a list having been laid before the Curators, which showed that various Professors had greatly exceeded in borrowing, and that a return was ordered.

Do you not understand that books are often kept for a great number of years?—I have heard that said; but I do not know that it is so.

"3. *Sub-Librarians.*—There are at present only two Sub-Librarians, upon whom is devolved the whole of the daily labour of the Library. They have, besides, some other tasks, which greatly divide their time and attention. When, therefore, it is considered that there are above 1,000 borrowers and consulters of books, it must be perfectly obvious that two Sub-Librarians, however diligent and assiduous they may be (and I believe those at present in office to be perfectly so), cannot possibly discharge the duties required of them in the way it is to be wished they should be discharged. The time and patience of the students are accordingly wasted and exhausted in the long, and frequently fruitless,

619

attendance, which they must give when applying for books; and hence the Library fails greatly in rendering that assistance to study for which it was instituted, and in exciting that desire for inquiry which it would be desirable to stimulate and to nourish. It is, in fact, viewed with a jealous eye, as an institution supported by the students for the benefit of the Professors. The primary and most fundamental objects of its institution require, therefore, that the number of Assistants should be increased.

"4. *Catalogues.*—Whatever treasures a Library may contain, if there is no key to them in the shape of a Catalogue, they must be comparatively useless and unproductive. It would not mend the matter much to have a Catalogue but altogether inaccessible to those entitled to the use of the books to which it is an index; yet such is the case in this University: there is unfortunately no printed Catalogue —an immense desideratum, which ought, unquestionably, to be supplied, when any available fund can be got; but there is a copious manuscript Catalogue, of which, however, no student, of any age or degree, is allowed the use. I consider this denial as most unreasonable, and glaringly opposed to the objects of the Institution. I know nothing connected with it more calculated to disgust a student than to see this great volume of instrumental knowledge spread out on a large table under his eye, but within a barrier, which he must on no account attempt to penetrate. The only apology offered for this proceeding is, that the Catalogue would be soiled and torn, if exposed to the touch of the students; and I will not deny that it might be liable to some risks, if put, without inspection or control, into the hands of the younger classes; but it seems preposterous to suppose that means and regulations might not be devised, sufficient, in a great degree, to guard against this, even in their case; at any rate, quite sufficient to allow a safe use of it to be extended to those above them. The additional assistance, which is otherwise necessary to render the Library, in point of usefulness, what it ought to be, would make all this easy."

Has it been proposed to make any Catalogue of what is denominated the Working Library, for the use of the students?—Not for the use of the students. There is, I believe, a separate Catalogue of that part of the Library; meaning the Circulating Library. Sure I am there is no Catalogue, even of it, always accessible to students. I know there is an alphabetical Catalogue of the whole Library; but from any use of it the students are entirely shut out.

Even supposing they do not get the use of the General Catalogue, have they any means of ascertaining whether the books they ask for, belong to the Working Library, which they are entitled to expect should be immediately given out?—No; strange to say, they have no means of knowing what part of the Library is allowed to circulate, and what can only be consulted. The General Catalogue should be exposed, under proper regulations, to the inspection of the students; and in that Catalogue every book not allowed to be taken out, should be marked with an asterisk.

What do you suppose would be the expense of printing the Catalogue?—I do not know how many volumes it might form. In the cheapest way it could be done, it would cost several hundred pounds.

Do you think the Students could derive much benefit from consulting any other Catalogue than a Catalogue Raisonnée?—Unquestionably, they would derive far more benefit from a Catalogue Raisonnée than from a mere Alphabetical Catalogue. But the privilege of examining the Alphabetical Catalogue would be highly prized; and it could not fail to lead to a more extensive use of the Library. There is no one, who has ever consulted even a common Catalogue, who has not, if at all of a studious disposition, had topics of inquiry suggested to him, that might not otherwise have come into his mind.

Would you not consider it to be an essential part of any improved system of management, that there should be a regular comparison of the Catalogue with the presses and shelves where the books are deposited, so as to know what number of books are missing?—If a Library is used, the Librarian must know whether the books entered in the Catalogue are there or not; therefore that comparison is in fact going on every day.

But not as a check upon the Librarian, or upon the system of management?—No.

Is there any annual or periodical review of the Library?—No: indeed I do not know any Library where there is such a review. It would be attended with a vast deal of trouble, and require a great deal of time; and the object could scarcely be worth the time and trouble; because no book can be out, of which the Librarians, if they keep proper receipt-books, have not otherwise notice.

Do you know whether any security is given by the Principal Librarian for the safe keeping of the volumes in the Library?—I believe no security whatever is given. I do not suppose it possible that any security could be given by any man in that situation; it would be a very indefinite sort of security, which no mortal could undertake.

"5. *Rules and Regulations.*—Under this head, there are three descriptions of persons to be considered—the *Professors*, the *College of Surgeons*, and the *Students*. It seems highly proper that the Professors, by whose ministry knowledge is to be dispensed among the Students, should be allowed a much larger use of the books than any other description of persons entitled to apply for them. Their privileges ought, however, to be subject to regulation, and to have definite limits. To whatever number of books they may, by the existing laws, be entitled, to that number they ought steadily to be restricted. Above all, they ought to be debarred from any use of the Library, which they could not enjoy but to its detriment, in point of order and utility. They ought not, therefore, to be allowed to interfere with the books on the shelves; because their doing so must be productive of confusion and delay in the business of the Library. Their superior station does not invest them with any rights or pretensions, necessarily issuing in such results. Yet, it is to be feared, that the rules in this respect are frequently transgressed; and that the evils thence arising will continue, unless they shall be met by suitable regulations, steadily enforced by the officers of the Establishment. The Professors ought, of course, to be accommodated with a separate apartment, where the new and periodical publications should, in the first instance, be placed; and every facility ought to be afforded them in consulting any number of books they may please to call for; but it is neither necessary nor proper that they should have any other immunities or privileges, except that of an enlarged power of borrowing. The number of books at present allowed to a Professor seems quite sufficient for ordinary purposes; and

University of Edinburgh.

Professor Napier.

26 October 1827.

when any extraordinary call arises, the powers vested in the Curators, of enlarging the supply on cause shown, will always ensure every indulgence that could be fairly required. There is no surer way of encouraging negligence and remissness in returning books, and thereby so far diminishing the general utility of a Library, than that of allowing too many to be taken out. Those best acquainted with the wants and habits of literary men will probably be the most ready to admit that the number of books allowed by the present Regulations is quite sufficient for ordinary use, and that to increase it, would only be increasing that indolent habitude of accumulating books around them, with which they are all beset.

Are the Commissioners to understand from those observations, that, in point of fact, the Professors can take out books without applying for them in any way?—Though the regulations bear that no Professor shall take books from the shelves, in point of fact they have been in use to do so, both for the purpose of reading in the Library, and borrowing.

Are the Books entered in the receipt-book?—When taken down to be borrowed, they are; but, if Professors were allowed to go into the Circulating Library, which, for the sake of speedy supply, is very properly fitted up without press-doors, and take down books at pleasure, it would immediately be thrown into disorder.

You have stated, that you conceive the number of books allowed to a Professor is sufficient; what is that number?—Twenty-five volumes. Of course, if he is engaged in any study which requires an additional supply, he has only to say so to the Curators, who will, in such case, allow an enlarged number.

Have you anything to suggest, with regard to proper rules for enforcing the return of books by the Professors?—It has been my object in these observations, rather to point out the matters or defects requiring regulation, than to enter into any detail of specific rules; but there could be no difficulty in framing rules for enforcing the return of books; and if these were sanctioned by this Commission, they would be more likely to be respected.

Would you propose assigning a limited period for which each work should be taken out?—There is already a fixed period; and it is not too long: it is only a month, or a fortnight, I believe, if the book is called for. But, I fear, the law is but little attended to, and seldom, if ever, enforced. In order to prevent a continuance of this evil, regulations must be framed, calculated both to compel the Sub-Librarians to do their duty, and to protect them in the discharge of it; for, so long as the Professors shall have to deal only with them, unbacked by the presence or daily superintendence of a superior officer, equal in station to themselves, it is much to be feared that they will be apt to encroach. Without attempting, at present, to enter into any details as to rules, I would beg to say, generally, that those of a *compulsive* kind, applicable to Professors, ought to be directed to three objects:—The limitation of the number of books to be taken out; the ensuring their return, if called for, on the expiration of a stated period; and the prevention of any meddling with books on shelves, except through the ministry of the Sub-Librarians.

Is not inconvenience experienced at present, from the Professors having so constantly out the works to which they make reference in their classes?—There are complaints of that kind current, but I have no means of judging as to their truth; and I am not disposed to believe them well founded, to any extent.

Under the present head, I have to observe, in the next place, that the use of the Library claimed by, and allowed to the *College of Surgeons*, is the result of an unfortunate agreement with that body, now of many years standing. As the members of the College are more than double the number of Professors, and as each is allowed to borrow to the same extent as the former, it consequently happens that the treasures of the Library are more deeply drawn upon by a foreign Corporation, than by that to which it is immediately attached. The services of those, who ought to be employed solely for the benefit of the Students and their Teachers, are thus largely called for by a set of men, highly respectable no doubt, but no more connected with the University than the Members of any other liberal profession. The pitiful return made for the extension of this privilege to so numerous a body, makes it difficult to figure a more unequal or preposterous alliance. I have taken leave to advert to it thus strongly, because I conceive that it is still open for regulation; that it has been allowed to grow to its present height *per incuriam;* and that its legal limits, as to each Surgeon, are those fixed by the denomination of a free *Civis* of the Library.

Is there any written document showing the conditions of that arrangement?—Yes; there is a contract between the University and the College of Surgeons, expressed in certain Resolutions agreed to by the two Bodies, and ratified by the Town-Council, as Patrons of the University. That contract, in consideration of an annual payment of £5, admits the Surgeons to the use of the Library. They have since voluntarily extended the annual payment to £20—very cautiously, however, making the continuance of that boon dependent on their pleasure. Yet that sum, divided among the Body, does not afford for each a payment nearly equal to that required for a half-year's use of a common Circulating Library. The right conferred on the Surgeons is expressly qualified by the term *Civis*. How it happened, that under that term they should have been allowed the same privilege as Professors, is beyond my comprehension. The Surgeons lately made an application to the Senatus in very strong terms, for an extension of their privileges; among other things, they asked an annual exhibition of the Library accounts, and the use of a separate apartment in the Library, furnished with the periodical publications. The application was referred to the Law Faculty, who came to the unanimous determination, that the Surgeons have no right to the privileges they enjoy at present, and that the legal privilege of each was only that of a *Civis* of the Library, which is the same with that of a matriculated Student.

Do you understand that any evidence can be recovered, as to the extent of the use of the Library which the College of Surgeons were allowed to have immediately after that contract was entered into, so as to afford any evidence of the understanding given of the word *Civis*

621

University of Edinburgh.

Professor Napier.

26 October 1827.

at that period?—I have made very careful inquiries, but I have not been able to recover any evidence of the use they enjoyed immediately after that period. The Library was then in a low state for funds. The College of Surgeons was a very small body—I do not know that it contained a dozen individuals; and therefore a contribution of £5 a-year appeared something; it now consists, I should suppose, of nearly 100 persons.

Did they make a donation of books?—That was one of the conditions; they transferred what they called their Library, which consisted of a parcel of Medical books,—mere trash, which nobody looks at now, and which I should think nobody has looked at for a generation.

Considering that a great number of the Members of the College of Surgeons give Lectures in Edinburgh, may not, very frequently, members of that body keep out the very works that the Professors of the University may require in the preparation of their Lectures?—The exercise of their privilege, as at present enjoyed, enables them to derive all the benefit from the Library that any Professor derives; and I am told, by the Sub-Librarians, that there are above sixty of them who are in the constant habit of borrowing books; that they borrow to the full amount they are allowed, that is, twenty-five for themselves and their apprentices; so that their demands make a very heavy call upon the services of the Sub-Librarians.

Do you understand that the students of the University had the same use of the Library, at the period of that contract, that they have now?—The students of the University had, I believe, the same use of the Library at that period as now; that is to say, each student was entitled to borrow books upon his Matriculation, as becoming then a *Civis* of the Library.

Was the term *Civis* then employed?—It was then employed, and is employed in the contract with the Surgeons.

Then the probability is, that the apprentices of the Surgeons have, in point of fact, a far greater use of the Library than any other class of students in Edinburgh?—The apprentice of any Surgeon who chooses to borrow, for the use of an apprentice, twenty-five volumes, has unquestionably a much greater use of the Library than any student can have.

Even though he may never have attended the University at all?—Yes.

What means are taken to enforce the return of those works?—I really do not know; that is a point to which I have not attended. I know, however, that, in a list exhibited to the *Senatus*, it appeared that a number of the Surgeons had been allowed greatly to over-borrow. In short, I consider the continuance of this privilege, as at present exercised, a greater abuse than was ever, perhaps, exemplified in any University Library; and, seeing the funds are not nearly sufficient to supply the wants of the students, either in respect of books or service, I think the Senatus, as guardians of their rights, ought to take steps for restricting the privilege of the Surgeons within proper bounds. The contract by no means supersedes the power of the Senatus to regulate the privileges of the *Cives* in such way as they may think proper. On the contrary, it acknowledges that power.

Will you have the goodness to state your further observations?—In examining the claims of the last, the most numerous, I will add, the most important class of those entitled to be considered in framing Rules and Regulations for the use of the Library, namely the *students*, I feel myself constrained to observe (but I do so without blaming individuals), that the system, as regards them, is too narrow, jealous, and exclusive in its principles. I am well aware that the Laws for a Library must be framed with reference to the character and condition of the great body of those who are to be admitted to use it; and that a system, well adapted to another place, might be unsuitable in this University; but, at the same time, I am satisfied that a more liberal scheme might be safely adopted, and that such is required, as well with a view to the credit as the usefulness of this great Seminary. I shall, therefore, offer a few remarks and suggestions, which it might, perhaps, be useful to keep in mind, in amending or remodelling the existing system. The use of the Library ought by no means to be limited to the borrowing of books; for, as there must necessarily be many of various descriptions, which cannot be lent, and as students must often wish to peruse or consult a larger number than it would be prudent or proper to lend at one time, it follows that the Institution must be viewed as far short of what it ought to be, if there is no suitable provision for the accommodation of students resorting to it for reading and reference. Every possible facility, compatible with the order and economy of the establishment, ought to be afforded for those purposes. It does not appear to me that this has been sufficiently attended to, in the arrangements proposed to be adopted in the new Library. The apartment destined for a Reading-room is too small, too distant from the circulating part of the collection, and very indifferently lighted. The room for graduation, a ceremonious purpose, which requires it to be used only once a-year, is evidently more suitable; and, as this purpose is quite compatible with the other, there can be no good reason for not using it in that way. Holding it as proper that there should be a large, commodious, and comfortable apartment for reading, I beg to observe, that a selection from the new and periodical publications ought, from time to time, to be placed in it, for the use of the students. It is a common, but, in my opinion, ill-founded objection to such a plan, that it would have a tendency to encourage a desultory mode of reading. The habit of reading is one of the most valuable that a student can acquire; and I know nothing so likely to form it, as to place within his reach all the more important novelties of the scientific and literary world. It is no doubt true, that to master a science, or to attain solid knowledge in any department of learning, the student must follow the method of systematic inquiry and appropriate reading; and that everything having any necessary or powerful tendency to withdraw his mind from such a course of discipline ought, as much as possible, to be avoided. But while it must, on the one hand, be allowed that the regulation in question would prove highly agreeable to the more advanced, and to all the more inquisitive students of every description, it cannot, on the other, be maintained on any certain grounds, that it would have any such necessary tendency to induce intellectual dissipation, as some appear to imagine. It seems far more likely, that

University of Edinburgh.

Professor Napier.

26 October 1827.

minds which might otherwise remain passive and inert, would in this way be excited to exertion, than it is, that minds otherwise disposed to solid study would be thereby diverted from it. Most of the students would naturally turn to those publications which concern the subjects of their respective classes, and would be thereby induced and enabled to enlarge their acquisitions, and to institute useful comparisons of facts, opinions, and doctrines. The periodical Publications, devoted to Literature and Science, have of late years risen to a degree of importance, wholly without example in any former period of the history of the world. They have become the almost exclusive instruments of the intellect of the country, in as far as it is employed in such pursuits. They ought, therefore, to be placed within the reach of the students, under such regulations as would ensure and allow an orderly and general use of them. Every means of information—every channel of inquiry—ought to be freely laid open. The arrangements of a University Library ought in no case to be formed upon any doubtful hypotheses, as to the course and range of reading which it may be beneficial or otherwise for a young man to pursue. We shall much more surely do our duty by opening wide the doors of this magazine of knowledge to all who are entitled to enter it, than by adopting a system of partial admission, grounded upon the supposititious notion, that the mind requires to be restrained and limited in the use of the intellectual aliments with which it is stored. In considering what is proper as to borrowing books, I would beg to observe, that this part of the business cannot be well conducted without an Index, which shall enable the Sub-Librarians immediately to discover whether any book inquired for is out or not, and if out, how long, and by whom it has been borrowed; and without a peremptory provision, that any book, which has been out the prescribed period, shall be called back as soon as it shall be asked for. In following out the spirit of such regulations as have been suggested, there can be no doubt that additional assistance would be required; and, in every view, such assistance would be useful; but there are two alterations of the existing arrangements, the adoption of which would go far to make the services of the present assistants sufficient, and to do away many grounds of complaint as to the administration of the Library. In the first place, the hours of attendance for borrowing ought to be increased,—it being quite obvious that the present practice renders it impossible to supply the students in a satisfactory manner. Instead of being open for borrowing only from eleven till two, the Library should be open for that purpose from nine till three o'clock. In the second place, the system of *Deposits* ought to be entirely abolished, and its place supplied by Regulations, calculated to afford the necessary securities for the due return of books. The idea that laws could not be framed, fully sufficient to accomplish that end, appears to me, in spite of all that is urged to the contrary, quite chimerical; and there is no change in respect of mere regulation which would, in nearly the same degree, contribute so much to the credit and to the utility of the Institution. The practice of obliging every student who borrows a book to deposit its value, or something near it, is in many respects objectionable; but I content myself with observing, that it imposes an inconvenient restraint upon the use of the Library, and that it operates as a heavy clog upon the time and attention of the Sub-Librarians, by making the receipt and return of the deposits a principal part of their occupation—an important object of their solicitudes. There are various ways by which the return of borrowed books might be provided for, without resorting to this odious system. It might be enacted, that no Matriculation Ticket should be issued to any student, without the insertion in the Record, not merely of his name, and the class or classes for which he matriculates, but of the place of his birth and present residence, and his parentage; that the name and other additions of any student failing to make the due returns to the Library, or otherwise to satisfy its regulations, should be handed to his Professor or Professors, to be read out as a defaulter; that no student should be entitled to any Academical Certificate, or to any Academical honour, without producing his last Matriculation Ticket, bearing an endorsement by the Librarian, that he has not contravened the regulations; and that the name and additions of any student as to whom the foregoing provisions might not be available, from his leaving the University, or otherwise, should be publicly advertised as a defaulter—previous intimation of such advertisement being given by written notice, put up in the Library at least ten days before.

With regard to the arrangements that have been contemplated for the new Library, does it not appear to you that the plan of keeping the students, while they are waiting for books, in that sort of Hall, is rather a repulsive mode of treating them?—Nothing could be more repulsive, were the old mode, of supplying the books through a wicket, to be continued; but that most unsatisfactory and chilling expedient is, I believe, to be abolished; and the business of the Library is to be transacted at the desks or counters ranged along the Hall alluded to.

Has a student any security, that the person, of whom he asks a book, actually goes to look for it?—The security, in this respect, is not what could be wished; for the apartment is not constructed so as to afford a full view of the circulating Library; and, indeed, it seems to have been originally formed with a view to the continuance of the wicket plan—not of one of open inspection and communication.

Will not the Stone Hall be rather a cold place for the students to wait in?—It is to be kept warm by means of heated air; but it ought to be matted, were it only for appearance' sake. Though not well lighted in any state, it has been grievously darkened by some internal erections, by no means necessary, and which, joined with the heavy counters opposed to them, entirely destroy the beauty that it possessed.

Is there any provision for the students sitting down while they are waiting?—I see no such provision.

Is it consistent with your observation and experience generally, that the more indulgence is given to students, under proper regulations, the greater value they will come to attach to the use of books, and the greater care they will take of them?—I should think so, judging *à priori;*

623

University of Edinburgh.

Professor Napier.

26 October 1827.

but I have as yet had but little experience of the conduct of students. I feel fully assured, in my own mind, that such would be the result.

Do you understand that a student could contrive to borrow nearly as many books as a Professor, provided he has so much money as to enable him to make a separate deposit for each book?—If a student is allowed to have only one or two books, he ought not, under the deposit system, to have more than that number. But speaking of the natural tendency of the system, it certainly goes to induce a Sub-Librarian in that charge, to give students, who can deposit a sufficient quantity of money, an enlarged number of books, because he has the use of the money. I think that is the natural tendency of the system; but I do not mean to insinuate that, in point of fact, it has produced that effect. I object to the deposit system mainly, though not entirely, as being a material bar to that use of the Library, and of the services of the Sub-Librarians, to which I think the students are entitled. I am convinced that even the lodging of a pound is a demand which some students, perhaps of the most ardent minds, cannot always conveniently comply with. If the books asked for are of more value, and the Librarian chose to exact two or three pounds, I see nothing to prevent him, and it would, to many, amount to a total prohibition of borrowing.

May not the tendency of the system be, to introduce some inequalities, by producing a certain degree of subserviency to students who have the greatest command of money?—Judging *à priori*, that is the natural tendency of such a system; because, as the Sub-Librarian has the use of the money, and derives a per-centage from it, the more money he has in his hands, the more profit he derives from it.

On the supposition that a student can command such a sum as £20, and deposit this in the Library, at the commencement of a Session, for twenty different works—is there not, in that case, a temptation offered to the Sub-Librarian to abstain from enforcing the rules with regard to the return of books, inasmuch as, during the six months, he might make ten shillings by this deposit, if the interest of money were five per cent?—I would say, without any hesitation, that, judging from the natural tendency of the system, such a result might be expected to arise.

In this way, are not the students who have no command of money, kept from the use of those books which another person may carelessly retain in his possession?—Unquestionably. There is another tendency in the system, too, though I speak of it merely as such, that it seems calculated to encourage remissness in getting back books; because the Sub-Librarian knows that he holds security, and that when the books are returned, he must return the money.

From an observation you have made, the Commissioners collect, that you are not satisfied with the mode of keeping the present receipt-books?—The mode of keeping the receipt-books I am not well acquainted with; but I know there is no Index of the kind to which I alluded, as being necessary to expedite the business of the Library. As there is no Index to the receipts for books borrowed, the Sub-Librarians must go to the shelves in order to discover whether a book is out or not; and they cannot say with certainty, even when they find it is not in its place, in whose hands it is, or how long it has been out. I do not know what process they follow to ascertain that.

Have you occasion to believe that the books are much injured by the students?—Yes, I have observed, with regret, that many of them are; but that is an evil that might be greatly corrected by strong regulations, and a vigilant and vigorous enforcement of them.

You think, therefore, that it is an evil which is not prevented by the system of deposits?—Not in the least, as I conceive.

Had you any experience of the Library, before the system of deposits was introduced?—No: when I was a student here it was in full observance. I conceive that the regulations applicable to the proper use of the books should be read by every Professor to his students, at the commencement of the Session, or hung up in the classes, or in the Library. If a student saw that he was to be called before the Senatus Academicus, or refused a certificate, or to be expelled, if he should be convicted of defacing a book, he would take care not to expose himself to such a risk.

Would there not be this difference between the system you propose, and the deposit system, that the deposit system bears upon all, whether they conform with the regulations, and use the books properly, or not; whereas the rules and regulations would be enforced only against those who transgress them?—Exactly.

Have any deposits been forfeited, in consequence of the injury of the books, since you were a Professor?—I never heard of any such forfeitures.

Do you understand that, at the end of a Session, supposing a student has got books for which he has deposited the sum that the Librarian required, he is prevented leaving the University without returning the books; or is there any call enforced whatever, or is it merely trusted to his wish to get back the money?—So far as I know, the holding of the money is reckoned a sufficient security. It is one of the evils of that system, that it has a tendency to lead the Librarians to trust to the deposit, and to take no steps whatever to call in books that may not be asked for, however long they may have been out.

You do not consider that the time that would be necessary for entering the books borrowed out, in such an Index as you have referred to, is any sufficient reason against enforcing a more complete system of receipt-books than obtains at present?—Certainly not; particularly if the system of deposits were abolished, the Sub-Librarians relieved of the trouble and responsibility attending it, and their time in consequence made available for better things.

Do you conceive that the students would derive any benefit, in order to prevent their being kept waiting, when a number of them went for books, if the practice were adopted, of their giving in, the day before, a list of the books that they wished?—I think it is useful for students to give in a list of the books they want. It is useful both to the student and the Librarian.

University of Edinburgh.

Professor Napier.

26 October 1827.

It is useful to the student, because he can, before he goes into his class at nine or ten o'clock, hand in his list, call when he is at leisure, and get his book; if he is disappointed of one, he may get another in his list; and it is useful to the Librarians, as enabling them to do the business in a more equal manner than when a number come at particular times, all asking for books at once.

Might not that regulation tend to make the Librarian inattentive to the requests of the students for books?—Not more, I think, than would otherwise happen. No doubt the Sub-Librarian may put a list in his pocket, and say that none of the books are in; but without such a list, he may go behind a column and amuse himself, and say the same. If a student wishes only for a certain book, he may ask for that book, and take his chance of finding it; but if he wishes for a number of books, one failing the other, it is but reasonable that he should give the Librarian a little time to look for them.

Do you think it is right that, if a student goes to ask for a book which the Librarian tells him is out, he should be entitled to require the Librarian to refer to the receipt-book, in order to ascertain where the book is?—I think, if the Librarian says that a book is out, the student ought to be entitled to say, "Who has it, and how long has it been out?" in order to ascertain whether the period has arrived when he may request the Librarian to call it in.

And that he may have the means, if that is not done, of complaining to the Professors?—He should complain, in the first instance, to the Principal Librarian; failing his attention to the complaint, to the Curators of the Library.

If the system of deposits were abolished, do you think that applications for books would become more numerous?—I think they would become more numerous; but the increased trouble thence arising would be far more than compensated by the cessation of the trouble attending the system of deposits, which superadds a sort of banking concern to the legitimate business of the Library.

What is your opinion with regard to the system of Class Libraries; do you conceive that is any useful auxiliary to the General Library?—I think it is a very useful auxiliary. Professor Pillans has made the experiment, and he is fully convinced of its utility. Professor Bell has furnished his class with the means of consulting all the necessary Law books—an arrangement which cannot but be highly useful. I consider the experience of Glasgow as placing the utility of Class Libraries beyond question.

Do you conceive it of much use to the junior classes, or chiefly to the more advanced classes?—The system must be useful for both; but I would conceive it of more use to the junior than to the more advanced classes.

And, so far as the books are concerned, of more use to the Library?—Yes, by preventing the necessity of their going to the Library.

Edinburgh, Saturday, 27th October 1827.

The Right Honourable LORD BINNING in the Chair.

The Rev. *John Williams*, Rector of the New Academy, Edinburgh, called in and examined.

Rev. J. Williams.

27 October 1827.

The Commissioners wish to know whether, in your opinion, in the present state of the Greek Class of this University, it is fully available, for those who go from your Academy to the University, to make the progress in the Greek language which, from their previous acquirements, they would be entitled to make?—There are three classes at the University. At the University, Professor Dunbar has one class, which commences Greek. Before a young man could have left the Academy, he would have been five years reading Greek, provided he had completed the Septennial term; therefore, of course, for him to go to the First Class would be absolute folly; were he to go to the second, I believe that the instruction, given during the five previous years at the Academy, would prove far more effectual than one year under Professor Dunbar; therefore, I would say, that the Second Class would be by no means eligible. Perhaps the Third Class, as far as professional teaching goes, and the communication of knowledge by Lectures, might be attended with great benefit by a young man who had completed the septennial course at the Academy.

Are you acquainted with the extent to which the reading and teaching of Greek takes place in that Third Class, as it stands at present?—I have made inquiries, but I am sorry to say that I cannot get two persons to agree in the account; there is a great deal of confusion, from the private studies.

From the accounts you have got, do you conceive that, in its present state, attendance upon that Third Class would be of essential benefit to a young man that had fully completed his studies at the Academy?—I should think the professional knowledge communicated by Professor Dunbar in the Third Class, would be of great use to him.

Supposing the New Academy to continue prospering as it has hitherto done, is it your opinion that none of the young men who have made any fair proficiency in Greek during the time they have attended at the Academy, will go either to the First or Second Greek Classes in this University; or that, for them to do it, would be only a loss of time?—To the First, none; to the Second, some will go.

Do you conceive it would be a loss of time to the average scholars at the Academy, to attend the Second Greek Class?—I do, decidedly; supposing that Professor Dunbar adapts his Second Class to those young men who have commenced reading Greek with him in the First, upon the supposition that five years at the Academy is more effectual in communicating a knowledge of Greek, than one year at the University possibly can be.

Do most of the young men, that attend your Academy, go through the whole five years' course of Greek?—The *data* I have had hitherto, are but few; this is the second year of the

625

University of Edinburgh.

Rev. J. Williams.

27 October 1827.

Seventh Class. The Sixth Class, the year before last, during the whole course, enrolled only forty-four pupils; and twenty-four was the amount of the Seventh Class last year.

Will you have the goodness to state the time at which the Academy was opened?—The Academy opened in October 1824. There was only one Rector's class the first year; that enrolled altogether, during the course of the year, sixty-seven.

Of whom, how many went on to the Sixth Class?—Forty-four, and twenty-four to the Seventh.

How many are in the Seventh Class this year?—Twenty-six, out of forty-two.

Have you any means of knowing, generally speaking, the pursuits and destinations of those young men who have left you, and who have not continued in the Seventh Class?—Several have gone to England, for a twelvemonth; many have gone to be apprentices to Surgeons: others again have gone to this University, in order to satisfy the bye-law of the Writers to the Signet, which requires two years' attendance at the University.

Then the result of that regulation at present has been, to withdraw them from school, and force them to attend College, earlier than in all probability they otherwise would have done?—Decidedly; to my own knowledge, in several cases, parents have declared it to be the case. There is another observation to be made upon that point: that many parents have adopted measures by which they attend the Academy, at the same time that they satisfy the bye-law, by attending the Civil History Class, under Sir William Hamilton, between three and four; there are five young gentlemen who thus elude the bye-law.

Do you consider that as disadvantageous?—I should think it is disadvantageous to that extent, that they are not well calculated for studying Civil History at so early a period of life. I ought to mention also, that I have known a young gentleman quit the Third Class and join the University, and that too, in order to secure a valuable Bursarship. I have known a boy, who stood at the foot of the Fourth Class, at the end of the year join the University. At the end of the fifth year, immense numbers of those boys who have least knowledge, join the University.

Then those are the very description of persons who ought to have remained with you?—No doubt of it. I look upon it, that the leading boys, at the end of the sixth year, would be well qualified for the University, but certainly not those at the foot of the class; but it is in general those that leave. I fancy, many parents are more anxious for the form of going through an University education, than for the substance; because I find that all those that do well at the Academy, remain with us to the end of the septennial course. Those young gentlemen who gained prizes, all of them, with the exception of one, returned from the sixth to the seventh; and the prize boys, with the exception of two, returned from the fifth to the sixth.

About what age are they generally at the conclusion of the Fifth Class?—Supposing, as a general rule, that they commence at nine, they would be then fourteen.

Do you consider that too early an age to go to the University?—Of course, with my English prejudices, I consider it far too early.

From the experience you have had in Scotland, or from any observation you have been able to make generally, of the disposition to afford children a liberal education in Edinburgh, and the district of country connected with it, do you see any difficulty in the same preparatory instruction in Greek being afforded in all the respectable and well-conducted Academies in Edinburgh?—Not the slightest; I am convinced of the contrary, on this account, that we make Greek imperative at the Academy. Last year there were 519 pupils on the establishment, and only two parents requested, as a favour, that their sons should not be taught Greek.

Do you understand that the system adopted at the Academy has tended to lead to improvements in the way and in the degree in which Greek has been taught in any of the other Academies in Edinburgh?—That is more than I can say; we have several young men now who have joined us, I think, with the idea of being Tutors, and I believe that they will be of great benefit. I believe the Tutors themselves in Edinburgh, connected with the Academies, have been obliged to read Greek far more than they were before accustomed—many of them have said so to me. I think that the great desideratum, at present, is, a number of persons in that station, who are capable of teaching Greek successfully.

Have any of the boys, who come to the Academy, in any of the different years, received any part of their previous education at any of the Parochial Schools in the country?—Very few; I have made inquiries, but I found hardly any. The greatest number of young persons who join us in the third, fourth, fifth, and sixth years, are the sons of gentlemen in the country, who, in general, have Tutors; and I have no hesitation in saying, that they are much worse prepared than the young gentlemen who have been taught in Edinburgh. A great many join my fifth class regularly, and I know perfectly well that they act as a severe drag upon it, in consequence of their inadequate preparation.

Do you attribute that to the inability of the Tutors to teach, or to the difference between public teaching and private, in any circumstances?—To the great difference between public and private teaching; of course, exceptions will occur, but in a large number we can see a considerable difference.

Can you afford the Commission any suggestions, by which you think the means of prosecuting the study of Greek at the University might be extended and improved?—I only received the notification of the Commissioners last night, and I am not quite prepared upon the subject; but if the Commissioners allow me time, I will consider it, and explain my own views upon the subject.

Generally speaking, do you consider that the young men who have completed the term of attendance at the Latin Classes at your Academy, are farther advanced in Latin than the Latin Classes in this University, and therefore receive no great assistance from them?—My

University of Edinburgh.

Rev. J. Williams.

27 October 1827.

own view of the subject is this, that if the young men who leave me at the end of the fifth, sixth, and seventh years, are all placed in the same class, they cannot derive commensurate benefit; as a course of reading, that would fully occupy the time of those who leave at the end of the fifth, would be mere trifling to the pupils who had completed their sixth year. I need not say how much this reasoning would be strengthened, were I to allude to the seventh class.

With respect to those who leave at the end of the seventh year, have any of them entered the First Class of the College?—None.

Have any of them entered the Second?—There have.

Do you think it is advantageous for them to enter that class?—I look upon it that the Professor is capable of communicating to them knowledge in a very great degree; but the point is, whether the majority of the class are in a state to allow him to do so.

You think there is too great a number of inferior scholars, to enable him to do them justice?—I look upon it, that, in education, the power doubles every year: for example, if I read a certain quantity in the fifth class, I double it in the sixth; what I do in the sixth, I double in the seventh; I should therefore say, that the work of the seventh ought to be doubled in the eighth year.

Supposing a boy goes out of your seventh class, you think he would receive benefit from the third class of Greek in the University?—I think, decidedly.

But if the third class of the Greek, and the second class of the Latin, are put at the same hour, do you think he could get benefit from attending both, in any way?—Certainly not; he could not possibly derive any benefit from attending the first class of Latin.

Then, generally speaking, what classes do you recommend to young men to attend, that leave you, intending to come to this University, supposing they have completed their term of instruction at your Academy?—If they are to be two years, which is the case with a great many of them, I advise them to take the second and third, because that is better than to attend the third class twice; but it is highly desirable, if possible, to raise the tone of the classes at the University, so that they may become University classes, instead of mere school classes. I think, that at present, in Edinburgh, the preliminary education is excellently conducted—better, perhaps, than in England; but the means of forming finished scholars are deficient.

Edinburgh, Friday, 2d November 1827.

The Right Honourable LORD BINNING in the Chair.

The Rev. *Thomas Murray,* residing in Edinburgh, called in and examined.

Rev. T. Murray.

2 November 1827.

Did you study at the University of Edinburgh?—I did.

You attended both the Literary Classes and the Divinity Hall?—I did.

Are you well acquainted with the circumstances of the students in general, particularly those who are from the humbler conditions in life?—I am, pretty well.

Could you state nearly what is the annual average expense at which a student, in those circumstances, may attend the Philosophical classes, during the length of session which is usually passed here?—I think the common expense of a young man, whose funds are very scanty, and who lives as cheaply as he conveniently can, including room and living, is from 7*s.* to 10*s.* a-week; I believe, for clergymen's sons, it will not exceed 12*s.* a-week.

That includes every thing but class-fees?—Yes. I have known many live at 7*s.* a-week for the whole session, including the rent of a comfortable bed-room, their only apartment.

And some, it is supposed, even continue to go through upon less?—I suppose some even upon less; indeed, I have known several live upon less.

It is presumed that the students come to this University from all parts of Scotland?—Yes.

Do you think there is any material difference between those who come from the Northern, and from the Lowland parts of the country, in point of circumstances?—I should think those from the Northern parts, as far as I have had an opportunity of judging, were poorer than those from the low countries; but I cannot give a decisive answer to that question.

In any considerable degree?—I should think not to any considerable extent.

Do you suppose that many come from the Highlands to this University?—A very great many from Argyleshire.

Have you any reason to suppose that certificates of attendance are obtained by students who have not gone through the whole session of six months?—I believe, pretty frequently; I have known several instances of it myself. I have known many instances of young men attending from three to four months, going away and getting a certificate of full attendance; and I have even known an instance of a student having enrolled his name with a Professor in November, and returning to the country to a family, living there for six months, returning to College in April or May, and getting a certificate of full attendance.

How long do you suppose that student attended?—I should think he did not attend probably at all; he was not in town above a week altogether.

That was in one of the Philosophy classes?—Yes.

Would not that seem to be facilitated by the want of any inspection of the attendance?—There was no inspection, and no record, and no discipline at all.

Do you think that the students, whose attendance is so defective as you describe, are likely to acquire so much knowledge as to add to the general learning of the country?—I should think, by no means.

With regard to the students at the Divinity Hall, do they come generally from all parts of the country?—From all parts.

Will you state what length of time you have known sustained as a regular session in the Divinity Hall?—The common idea among the students is, that three months or thirteen weeks

627

University of Edinburgh.

Rev. T. Murray.

2 November 1827.

entitles a student to demand a certificate from the Professor of Divinity; but I have known students, who have not attended more than ten or twelve weeks, get their certificates, and those are sustained by the Presbytery; indeed, it is not known by the Presbytery whether or not the session is full: it is given as a certificate of full attendance; but the students have an opinion that they are entitled to claim a certificate at the end of three months.

Do you consider that, if regular attendance for two or more sessions were enforced at the Divinity Hall, it would exclude any considerable proportion of persons from the Church?—I should think not; it would probably protract their studies a little, but I should not think it would exclude any of them, as the thing now stands; there being no fees at the Hall.

Have you some doubt whether, if both additional attendance and fees were exacted, it would exclude any considerable number?—I should think, just now, it would have very little effect of that kind; it might probably protract the studies of a few, a little.

Have you had frequent opportunities of coming in contact with students, and knowing their means and circumstances?—Very frequent.

Do you suppose that, generally speaking, the students of Divinity, who do not give regular attendance, have the means of prosecuting their studies to any advantage in the country?—I should think they have not means sufficiently, from the want of proper society; but chiefly from the want of books; they may not have the ability of purchasing books, or an opportunity of getting them from friends.

Do you think that the session might be advantageously extended here, without bearing hard upon the circumstances of any great number of the students?—I should think so; very much.

For what length of time—for eight or nine months?—I should think so; but I may mention a circumstance that has come within my knowledge; that when Teachers, who have Parochial Schools, come into town, so far as I know, they generally employ substitutes for six months, though sometimes they are not that length of time at College—a proof that they can conveniently attend at least six months.

With the exception of those who may not have gone through their University education before they have been placed in schools—with reference to the generality of students, do you think the session could be prolonged, without any material inconvenience to the students?—I should think it could.

Do you understand that the long interruption to the classes, which is given by the long vacation, especially in the Language and Philosophy classes, is detrimental to the progress of the students?—I should think, decidedly detrimental.

Do you think it is so considered by their parents, and those interested in them?—I think it is very much considered as such, and very much considered as such by some of themselves—by those who are anxious to employ their time to advantage.

Then you do not think that the prolongation of the session would be attended with any general complaint from the students, or from their parents?—I do not think it would.

Do you think the students in general feel it to be a disadvantage, that there is little or no Examination in the Philosophical classes?—It is complained of by almost all of them, as a great disadvantage; and I have heard them frequently compare the state of this University and others, and give others the preference, because there is more vigilance and more discipline exercised in the classes.

When you studied at this University, did you find that you had sufficient access to the books of the Library?—Not sufficient access; because, when we went for the purpose of getting a book, a great deal of time, probably an hour, was spent in waiting; and because, whether it was upon a common subject or not, it very often was not in at all; or if in, you had only an odd volume or two of it. We were very much troubled in that respect.

Do you think it is in the power of a student, who happens to have a greater command of money than others, to engross a great number of books, and to detain them for a great length of time?—I believe that takes place very frequently. I have known examples of young men going to the country with books from the University Library, and keeping them at least six months; and they have the privilege of getting out any number of books, provided they deposit money in proportion.

How many have you known one individual take out?—I think I have known a family going to the country, who have deposited £14, and have got books to that amount out—pretty common books, and books that were used by the young men at the College.

Did you understand those books to be regularly returned, or to be kept long?—I believe the books I have referred to, were not returned during the summer, but at the end of it.

Have you known books kept out the whole year?—I have known books kept out the whole year; I have myself had books out that length of time.

How many have you ever had out at a time?—I think I have had from eight to ten guineas deposited at a time.

Then it would appear that there is no sort of call upon the students to return the books after a length of time?—I believe the printed schedule that they get, requires them to return them in the course of a fortnight or three weeks; but I never knew them called for, and I never knew any fault found, because they were not returned.

Then they are just taken back at the end of the period without notice?—Yes.

Does it appear to you, that there is any ground of complaint, with reference to the books in the Divinity Hall Library?—I think the Library is extremely defective: the works are very much broken down; they have odd volumes of them. But I never found access to it at all unpleasant; the Librarian was always anxious to give what books they have; but I have discovered this, that some students have got out a vast number of books, from six to ten, and twelve volumes, or upwards—books which other students were requiring in the mean time, and could not get.

University of Edinburgh.

Rev. T. Murray.

Was that an infringement of the regulations?—It was always understood to be so, and was very much complained of by the other students.

---

2 November 1827.

Rev. J. Ramsay.

The Rev. *John Ramsay*, Minister of the Parish of Ormiston, called in and examined.

You were some time Librarian of the College Library?—I was.

And also of the Divinity Hall Library?—Yes.

It is presumed you had great means of knowing the circumstances of the students attending this College, in consequence of holding those situations?—I certainly had some means.

Did many of the students of this University come from the Highlands as well as from the Lowlands?—Yes, a great many.

Did it appear to you that there was any difference between the circumstances of the students from the Highlands and those from the Lowlands; or that many from the Lowlands were as straitened as any others from the Highlands?—With regard to the students from the Highlands, I did not know their circumstances particularly, because I was not acquainted with almost any of them, farther than knowing that they came from the North. I have been told that several of them were in very poor circumstances, and were supported and brought forward by the patronage of those to whom they were recommended in Edinburgh, by receiving gratis tickets, and by societies connected with the Highlands.

What do you suppose may be the annual average expense, exclusive of class-fees, for which students in those straitened circumstances are able to go through the session here?—Exclusive of fees, I think, in my time, it would be under £10.

Was that the case with respect to a considerable number of students?—With respect to all the students in those circumstances, I may say the great bulk of them were under £10.

And some of them, it is supposed, even lower?—I should think something less; two or three pounds, perhaps.

Do you suppose that an extension of the session would have excluded a considerable proportion of those students from attendance at the College?—It depends upon what the extension might be.

Say for two months, or for three months?—I think it might have excluded some, if it had been extended so much as that.

But not any very great proportion?—The session at that time was considered to be about six months; that is to say, from the end of October till the beginning of May. And had it been extended more, I think several might have been excluded; and I know it as a fact, that many of the students in the circumstances mentioned, did leave the College before the end of the session, because they were not able to support themselves any longer in Edinburgh; they left it on account of straitened circumstances.

Do you conceive that there would be any serious hardship in enforcing regular attendance at the Divinity Hall for several sessions?—I think there would be a very considerable hardship. The law at present requires one year, which I think is an advantage; because the more regular attendance can be given, the better; but to enforce the whole, or almost the whole, I think, would be attended with very considerable disadvantages; because it would preclude a great many from attending, who, according to the present arrangement, are able to attend; and it might preclude many from getting through with their studies, who are now able to do it; and there are a great many who have hitherto come forward to the Church in very poor circumstances. They have to submit to considerable sacrifices in getting their education; and, were you to enforce regular attendance all the time they are studying Divinity, it might exclude a good many of that number. I think it is of great importance, that too many should not be excluded; since it is very well known that habits of economy are absolutely necessary to those who enter into the Church; because a good many of the livings of the Church are so small, that they cannot afford a clergyman the means to maintain and educate his family, except by observing the greatest economy. Now, if you exclude that class of students who have been accustomed to fill our Churches, and open it more to those who have more funds, those persons, when they enter into the Church, will find it very difficult, when in possession of those small livings, of which there are a great many, to submit to those habits of economy which are absolutely necessary to enable us to keep up our station and respectability in society; therefore, I think, it would be perhaps doing injury, to throw too great restriction upon young men of that description.

In the case of what is called partial study, how do you conceive that the disadvantage of not being able to attend Lectures, and having access to books, can be supplied?—After the students' having laid the foundation of their education, by attending the Literary and Philosophy classes, and getting initiated into the study of Divinity, the only way that it can be supplied appears to me to be, when they go to the seats of the Presbytery, and to their parishes, to avail themselves of the assistance of the Clergy. Every clergyman is, in fact, a *Doctor* of Divinity; he naturally takes an interest in the students living under his charge; he can supply them with books, and direct them in their studies: the Members of Presbytery can also assist in that way; they are all Teachers of Divinity. That seems to be the only way in which he can make up for the loss. I think, however, the not being able to attend regularly at the University, where he can mix with his fellow-students, and get the benefit of their assistance, as well as of the Lectures of the Professor, is a very great loss.

Had you any personal experience of the disadvantages of partial attendance at the Divinity Hall?—I never had, because I was a regular attendant.

Do you know any instances in which partial attendance has been attended with prejudice?—Yes, I think I do, where young men have not availed themselves of the opportunities they had, that is to say, of the clergymen in the neighbourhood, and where they have not acquired

629
University of Edinburgh.

that knowledge, and perhaps that practice of reading and of speaking, that they might have acquired, had they attended regularly.

Do you think there is a difference, generally, between the attainments and the qualifications of those who have attended regularly, and those who have attended partially?—I believe, in general, there may be some difference.

Do you think that is shown at the Presbyterial Examinations, or is it from their future appearances and character in the Church that you judge?—I judge more from their character as Ministers.

Then the result of your opinion is, that, while you see the great advantages of regular attendance, you think, that, if it were required universally, it would exclude an useful and a considerable proportion of the students who now enter the Church?—Yes, I am of opinion that it is a very considerable advantage to be able to attend the Divinity Hall regularly, but that it would preclude a great many useful and able persons from filling situations in the Church.

Are most of those who give only partial attendance, tutors in families in the country?—And Schoolmasters.

Do you think that such students as are tutors in families, are more likely to acquire habits of economy, than those who are struggling through difficulties, in endeavouring to carry on their own studies, at the same time that they are assisting the studies of others?—No, I do not know that; I rather think not, so far as those in gentlemen's families are concerned.

Do you not suppose that a considerable number of that class might complete their education at the Divinity Hall in the first instance, and then obtain the situations of tutors afterwards, when, perhaps, they might be more qualified for the latter?—I can state as a fact, that a great many of the description I am speaking of, find the utmost difficulty in getting through the previous course of education; and if, as is proposed, a very considerable additional burthen be laid upon them in the more advanced period of their studies, by exacting fees at the Divinity classes equal to the other classes, this must operate as a very heavy burthen indeed.

Do you think that the students are less able or more able to pay a reasonable fee, when they enter the Divinity Hall, than when they are in the Philosophy classes?—That depends upon circumstances. Those who reside in town, and who get teaching (there are a considerable number who support themselves by private teaching in this town), are much better able to pay a fee when they come to the Divinity Hall: but the greater proportion are not in that situation; they have not teaching; they come from the country, where they have acquired a little money, and their funds are frequently run out by the time they get that length. If they have a little patrimony, or have made a little money by teaching in the early part of their studies, it is in general exhausted by the time they get to the Divinity Hall. I think that description of persons are much less able to pay a fee when they enter the Divinity Hall, than when they first begin their studies at the Literary classes.

Did you ever know any individual attending College, and capable of distinguishing himself, who was stopped in his literary career by the want of funds to carry him forward?—I do not recollect any. I know instances of persons who have come to the College in very poor circumstances, but they were taken notice of by those who were able to bring them forward, and they were brought forward in that way; for instance, the late Dr. Murray, a very intimate friend of mine, was brought forward in that way. He had not wherewithal to go through the classes of the University, but he was patronized when he came here, and enabled to complete his studies.

Have you generally observed it to be the case, that, somehow or other, young men of talent find the means of getting through?—That is generally the case with those who are remarkably distinguished by talent, as Dr. Murray and Mr. Leyden, and some others.

Do you not also conceive, that a very considerable number pass through the Curriculum, both of Philosophy and of Divinity, without receiving almost any benefit whatever?—Yes, I do conceive there are a great many that receive very little benefit.

Do you think, on the other hand, that the facilities afforded for entering the Church, by the circumstance of there being hardly any expense rendered necessary, except, by the recent Regulation, one year's attendance at the Divinity Hall, may not rather have a tendency to determine the views of some to the Clerical Profession from that consideration alone, who otherwise might not think of that as their profession, and may not perhaps be very well qualified for it?—I should think the facilities that are given to that class of people, to get into the Church, may determine a good many to turn their attention that way.

Supposing that class were excluded, do you not think that that benefit might partly counterbalance the inconveniences arising from the loss of the other class you have alluded to, as a valuable class of Students?—I am by no means sure of that; because, from the circumstance I mentioned, I believe there are a very great number who enter upon their studies, induced by the view of getting easily through, and having facilities for getting forward to the Church; and then I think it is a consideration that the Church should never lose sight of, that habits of economy should be acquired; because, if they are not, the Church cannot supply the Clergy, in many situations, with the means of living otherwise.

You had the management of the Divinity Hall Library at one time?—I had the management of the Divinity Hall Library for three years, and of the College Library for about eight years. I was not principal Librarian; Mr. Dalziel was so, all the time I was there.

In what way was the Divinity Hall Library conducted at that time, with regard to the giving out of books, and the purchase of books?—There were two Librarians.

Who appointed the Librarians?—The Professor of Divinity; and the way in which they were paid was, that the Professor had the Patronage of two Bursaries, and he gave those

University of Edinburgh.

Rev. J. Ramsay.

2 November 1827.

Bursaries to the persons he appointed Librarians, as their payment for that office; and they met two days a-week, an hour a-day, and gave out, at those hours, the books that were in the Library to the Students of Divinity. With regard to the choice of the books, that was with the Professor; there was no particular council of the Students, or any kind of society among them for that purpose; but if any of us knew of a book, connected with Theology, that we thought would be useful to the Library, we generally, either immediately or through some channel, mentioned it to the Professor; and, if he approved of it, it was got into the Library. That was the way in which books were got into the Library at that time. I became Librarian there about 1799.

Does anything occur to you in regard to the way in which the business of the College Library was conducted at that time, or can you point out anything that you think would be an improvement with respect to it?—It was not open every day. I believe it is open more now, for the Students getting out books.

Was there a system of depositing money?—Yes, there was always, for the Students. The Professors had the power of recommending any of their friends to get out books, on their receipt; and, in those cases, there was no deposit; but when the Students applied for books themselves, they always left a deposit.

Did it occur to you, that the deposit bore hard upon the circumstances of any of the Students, or interfered with their reading?—I do not think, in the least; because they very often, when they came to the College with funds to carry them through the Session, left a guinea, which was the common deposit; sometimes more was taken—I have seen five guineas taken as a deposit for a valuable book; and they could recover their deposit at any time when they needed it. They took it up, or put it down, as they found occasion, through the Session; and they got it up at the end, when they came to settle their accounts.

Had you any instances of books being lost from the Library at that time?—There were several disappeared; and that circumstance was often discovered, from the deposits that were left in the Librarian's hand, and never called for.

Does it occur to you, that the necessity of giving a deposit prevented Students from taking out books?—I do not know any instance.

Does any other method occur to you, by which the security of the books might be provided for?—I do not know any other, because it was reckoned at that time absolutely necessary. There were a great many Students from Ireland, from the Islands abroad, and from different parts of the Empire, that the persons connected with the Library knew nothing about, and had no hold of. If they left the country, there was no way of getting back the books; the getting back their money was looked upon as some kind of security and inducement to them to return the books.

Were the books much abused by many of those who read them?—No, I do not think they were.

Did much inconvenience arise from the unrestricted use that the Professors had of the Library?—Very considerable.

Were books often kept out for many years, which it was impossible that the Professors could be using?—The Professors kept a great many in their own hands, and in their own Libraries, for years.

The books were not required to be returned at the end of each Session?—No.

Was any periodical call ever enforced of the books that were taken out?—There was not, in my time.

Do you know if any of the books were lost which the Professors had out?—I rather think there were some which could not be found, particularly at the deaths of individuals; I think, at Professor Robison's death, something of that kind happened.

Did it often happen that books have been in Professors' hands for many years?—It did happen.

A number of books?—A considerable number; and the Students frequently concluded, very unjustly, that the Librarians did not act faithfully; that is, that they denied books, when the books really were not in; but the Students thought that they were in, and that the Librarians did not wish to give them, when they really were in the hands of the Professors, or of Members of the College of Surgeons, who had a right to read books from the Library. They are a pretty numerous body, and took out a great many books.

Did it often happen that the books in the hands of the Professors, and of the College of Surgeons, were exactly the books that the Students were most needing?—Often, and particularly the new books. No doubt, the Curators took care to have a supply of those that were generally run upon, such as the common class-books; there were, perhaps, six or seven copies of those books.

Do you remember if any book was kept when you were Librarian, in which the Students had an opportunity of marking down the titles of books which they wished to be purchased for the Library?—I do not recollect any book being kept for that purpose.

Do you think it is essential for the welfare of the Library, that the principal Librarian should be a Professor?—I am not prepared to give an opinion upon that subject.

Do you think that a Professor is more likely to exert authority over the other Professors, than one who is altogether independent of them?—No, I do not think he is.

Did the Principal Librarian, in point of fact, ever attend in the Library, or perform any duty, when you were there?—Mr. Dalziel was then Principal Librarian, and he attended frequently himself; he even gave out books, attended at the Professors receiving books, and at the Matriculations and Graduations; and when I attended the Divinity Hall class, gave out the books himself, till I returned.

And yet, notwithstanding all that, this laxity went on about the Professors' books?—It was

631

University of Edinburgh.

Rev. J. Ramsay.

2 November 1827.

perfectly known that the books were out in the hands of the Professors, but the Librarian could not get them brought in; he had not the power of enforcing their being returned.

Do you remember if the accounts of the books purchased by the Divinity Hall were submitted to the inspection of the Students of Divinity, while you were Librarian?—They were not.

Do you recollect whether the Professor was in the habit of announcing in his class, that the Students might have an opportunity of satisfying themselves that the money which they contributed, was faithfully expended in the purchase of books, or that there was any notice to that effect?—I do not recollect that he ever announced such a thing; in short, we, as Students, knew nothing about it; the accounts were never submitted to us.

Mr. *William Roxburgh*, called in and examined.

Mr. W. Roxburgh.

You are a student of Divinity?—Yes.

You studied partly at Glasgow, and partly at Edinburgh?—Yes.

Can you state what is the average annual expense of a student, in humble circumstances, at Glasgow?—I believe a student, in ordinary circumstances, does not generally exceed £25. Those in *humble circumstances* (by which I understand the poorest class of students) do it, I believe, for about £16 or £17, including the class-fees; and their board and their room-rent, and the books they may need for their classes; I do not include clothes, or anything of that sort.

What is the weekly expense of a room and fire?—A very good room and fire may be got for 6*s*. a-week, for students in ordinary circumstances.

What is the expense of living?—About 5*s*.

Do you think a student can live at the same expense in Edinburgh?—Not quite so little; it will take 7*s*. or 7*s*. 6*d*. to procure as good a room in Edinburgh as may be got in Glasgow for 6*s*.

Do many of the students feel the length of the Session a hardship?—A number of them, I believe, do: at least, they go away as soon as they conveniently can; a great number of the students in humble circumstances do not come in till the Sacraments are over, and they go away when the Sacraments commence.

How many months' attendance is that?—Scarcely five.

Do many obtain certificates of regular attendance, who have not been above four months?—I rather think not; I know, if they are applied for, the Professors will object to it. If a student is taken unwell, they will not allow the Session to be lost, but they will state the circumstance.

Is it a common thing to obtain a certificate of regular attendance, although the attendance has not exceeded five months?—Yes.

When you speak of £25 being the expense of attending a Session at Glasgow, to what class of persons do you particularly refer; do you mean persons that board regularly, or that provide themselves as they can?—I mean students of the middling class, who rent a room at about 6*s*., and provide their own food; I speak from my own experience.

Has it fallen within your knowledge, that many persons struggle through a University education, at a much lower rate than that?—I have known some do it at a great deal less. I have known some do it at about £16 or £17, including the class fees; but that was with great exertion indeed.

Is it frequently that such cases occur?—I believe they occur frequently.

In stating £25 as the expense, do you suppose one person to occupy a room by himself?—Yes; if he has a companion, it will make it about £4 less.

Do not many live at the rate of about 4*s*. a-week?—Yes, I believe a number do at about 4*s*.

May not a room be had in Edinburgh for 5*s*. or less?—It may; but not quite so good as a room in Glasgow at the same money; they have certainly fallen a great deal within two years in Edinburgh.

Did you find that you had much better access to the Divinity Hall Library in Glasgow than in Edinburgh?—I must say, according to my experience, that I generally got the books more readily that I applied for in Glasgow.

Is there much difficulty in Edinburgh?—I have never applied very often here; but I have often heard my companions complain that they did not get the books they applied for.

The Rev. *John Williams*, Rector of the New Academy, Edinburgh, again called in, and further examined.

Rev. J. Williams.

Will you have the goodness to make any suggestion to the Commissioners, or give them any information which has occurred to you, with respect to the subjects to which your attention was directed in your former examination?—I should humbly propose, that no Elementary class should exist at the University, for the purpose of commencing the study of either the Greek or Latin languages; that due notice should be given, and sufficient time allowed, so that the public might understand that, after a certain period, no one could be admitted to the Greek class at the University, until he had committed to memory the essentials of the Greek Grammar, and was capable of translating, with considerable facility, the four Gospels, and the Acts of the Apostles; that, after a certain period, this standard should be raised, and no one be admitted except he could at least translate, with considerable facility, the Anabasis of Xenophon, and six books of the Iliad; that, in the Latin class, no one should be admitted who could not translate Sallust and Virgil with considerable facility. I would also propose, that the Examination should not be conducted by persons interested, but by an independent officer, invested with the power of excluding or admitting. I should propose that the Professor should, at the commencement of the Session, mark out a certain line of reading for every individual pupil, both during his continuance at the University, and during the recess.

University of Edinburgh.

Rev. J. Williams.

2 November 1827.

Above all, that at the termination of a Pupil's Academical studies, there should be a Public Examination by sworn officers; and that the different candidates should not be entitled to degrees, except they attained a certain prescribed standard; and that all who distinguished themselves by superior attainments, should be classed, and have their names printed, and laid before the public. I would propose that this Examination should also be open to the public, and to all the University.

Do you propose that there should be an annual Examination for those who are candidates for degrees?—I do not propose that a candidate should be annually examined, but there should be an Examination, every year, of those pupils who should have completed their Course.

You do not propose to make it compulsory, but that it should be only for those who are candidates for degrees?—Only for those who are candidates for degrees. I have not the least doubt that it would soon become the fashion, and that almost every one would rather undergo the Examination than give up his degree; a degree would then become valuable.

How many years' attendance would you propose should bring to a degree?—Three years.

Would you have one degree or two degrees?—One efficient degree.

Would you have the degree of Master at the end of three years?—I should think one degree would be quite sufficient for the majority. It is very difficult to make two efficient degrees.

Would you include the whole of the Philosophy classes, and the Mathematics, and everything within the three years?—I cannot decide. Much might be done during a period of three years' regular attendance.

Bearing in mind still what you have said, that one efficient degree would be sufficient, would it be an improvement upon the plan to have a Bachelor's degree at the end of the third year, and a Master's at the end of the fourth, the same rigid examinations for the Master's degree not being repeated, provided the Bachelor's degree had been taken with considerable reputation?—I have not the least doubt that, if the second examination was made really an examination, turning upon the merit of the candidate, it would be of great use; otherwise, I am afraid, it would soon be degraded into a mere form.

Supposing the first examination was confined to Logic, Mathematics, and the Classics, and that the second examination embraced the other branches of Natural and Moral Philosophy?—In that case, the fourth year might be most advantageously occupied, and the examination confined to those branches. I do not despair of myself seeing the day, when the school attainments of the pupil shall be so increased as to render it possible for the Greek Professor beneficially to adopt the following, or some similar Course:—That a Course of Greek History (taking Thucydides as the principal text-book) should occupy the first year, and that a Play of Sophocles should be occasionally read; that, during the second year, the Orations and Æschylus should be studied in the same manner; that Aristotle's Ethics and Rhetoric, together with a view of the principal doctrines of the Platonic Philosophy, should be reserved for the third year; that these more serious studies should be diversified by occasional readings of Pindar and Aristophanes. After such a Course, the scholar would be far better qualified to attend the higher classes of Moral and Natural Philosophy, and be capable of understanding the subjects.

In proposing that the degree should be taken at the end of the third year, it is supposed that you assume that your complete system in the Elementary classes has come to its maturity, that is to say, that it is the highest qualification?—The highest qualification. I assume that the pupil enters well acquainted with Xenophontean and Homeric Greek. I would also suggest, that many persons might, during the third year, after having been placed in communication with the Professor, be allowed to retire into the country, and not necessarily remain here. That system, I believe, has been pursued with great success at Trinity College, Dublin, where pupils are occasionally allowed to retire. From my own experience, I can say, that during the last year at Oxford, no Tutor exacts regular attendance on Lectures from a young man whom he knows to be struggling for honours; he only calls upon him occasionally, in order to judge respecting his progress from minute examination.

Conceiving that his intervention would rather delay him than forward him?—Yes. During my last year's residence at Oxford, I attended no public Lectures; I was occasionally visited and examined by my Tutor. At Christ Church, there are no lectures; the Tutor is in communication with the pupil once a-fortnight, or perhaps oftener.

Have you turned your attention to this point, whether it might be consistent with the structure and the plan of discipline of the Scotch Universities, to couple with the Professorial teaching, private reading with a Tutor, under the control of the Professors of the College?—The benefit of such a plan would be certain, provided a Tutor was allowed only to take a definite number of pupils. Under proper guidance, he might be made a most efficient aider and supporter to the Professor.

The Tutor being appointed by the Senatus Academicus?—Yes, but entirely under the control and direction of the Professor: twenty, I should think, would be fully as many pupils as ought to be allowed in such a case.

Would you propose to have particular Tutors, on particular subjects?—That is a very difficult question; I am afraid the division in that case narrows the mind more than we are aware of; but to a certain extent, the Tutors should necessarily be restricted to particular branches.

In what manner would you propose that those Tutors should be put under the control of the Professors?—That the Professor should have the direction of the course of study to be read in the private class-room of the Tutor.

And that each Professor should direct for his own branch?—Yes.

In short, your meaning is, that this system of private teaching should be subsidiary entirely

633

University of Edinburgh.

Rev. J. Williams.

2 November 1827.

to the labours of the Professor?—Entirely subsidiary. We know perfectly well, at the English Universities, that the Professorial duty is entirely a sinecure, at least, in most departments, to the great and serious disadvantage of the pupils; because they are unable to gain general views upon the subject of their studies; they are taught mostly by young men who have scarcely finished their own studies, and consequently are very deficient in the power of generalizing their system of instruction, and of communicating knowledge in a more condensed form.

Supposing that the circumstances of the students attending the Scotch Universities will justify an extension of the Session, do you conceive that it might be very advantageously prolonged beyond six months?—In my opinion, six months is too short a Session—nine, too long; eight, perhaps, a proper medium. But every other measure would be inefficient, without the Public Examinations by sworn officers, and placing the young men according to their talents and acquirements.

Something analogous to the Public Examination at Oxford?—Yes; I am certain that such a measure alone would elevate the whole system; because young men would labour and struggle for the distinction conferred by a high class, in the same manner as they would in order to gain a Fellowship; indeed, we often see men at Oxford, to whom Fellowships are no object, work harder than those to whom they are.

Would you make different grades, in passing the Examinations, so as not to put a young man back, because he had not got the highest eminence?—Decidedly; the great majority, after passing a fair Examination, should be entitled to their degree, but not to have their names published as entitled to Honours.

Do you consider it to be of importance, that the Examinations should not be in the hands of the Professors?—Of the greatest.

In what way would you propose that the selection of the Examiners should be made?—Young men who have distinguished themselves three or four years previously, to whom £80, for three months' exertion, would be an object.

Would that apply as well to Examinations in the exact Sciences, and in Moral Philosophy and Logic, as it would to the Classics?—Exactly in the same manner.

Are all the Examiners at Oxford sworn?—They are.

Who chooses them?—The Heads of Houses.

Has the decision of those Examiners at Oxford generally been satisfactory?—I never heard it objected to.

Have they carried sufficient weight along with them?—They always have; which they would not have done, perhaps, without the oath. This renders all private intriguing and solicitation impossible.

Are they chosen annually?—Biennially. Originally, the same Masters examined in the exact Sciences, and in the Literæ Humaniores; of late, a division has been made, and different Examiners have been appointed for each.

It is presumed, that the talent with which those Examinations are conducted frequently leads to subsequent preferment?—No doubt of it; it is a great object of ambition to young men.

Are they prohibited from having any pupils preparing for Examination?—They cannot examine a pupil of their own; nor can they examine a pupil belonging to their College.

May Examiner A. examine a pupil of B.'s, for instance?—Yes. In fact, the leading Tutors are the Examiners; but as long as the schools are open to the whole University, there can be no great abuse. I may, perhaps, be allowed to suggest, that, in my opinion, there is in Scotland a great want of intermediate Schools, between the Parochial School and the College. If there could be a dozen or twenty schools adapted for young men between thirteen and sixteen, I should look upon it as a very great improvement in Scotch education.

Would you have those Schools scattered in the different burgh towns?—Yes, with a building adapted for the purpose, and £100 a-year salary. I am satisfied that the expense would not be very great, and the benefit would be most important.

If there were a dozen such establishments, with an obligation on the Master to teach Greek up to the point you have mentioned, would that, in your opinion, accomplish the object?—It would accomplish the object entirely. I have been looking at the Academies. I looked over the Ayr Academy with great attention; but they aimed at too much; they joined it to the Parochial School, building a kind of Academical structure upon it, which I think is a mistake. At Dundee they are going to do the same thing; but while the Parochial School system is so perfect with respect to the lower orders, I think it is a great desideratum that that period, between the Parochial School and the coming to the University, should be well occupied.

Have any young men come to your Academy from any of the larger Grammar Schools in the burghs—from Montrose or from Dundee?—Not from Dundee; but several have come from Inverness and from Perth, and from Tay and from Ayr.

Have they generally been tolerably good Scholars?—Not so good as the Edinburgh ones.

Supposing the students at the University to be going on in their advanced studies in Greek and Latin, in what order would you set them to work upon Philosophy, Moral or Physical?—To a certain extent, they might go on together; during the third year they might go on together to a great extent.

Along with Greek and Latin?—Yes.

Do you suppose that they should have got a good deal of Mathematics, before they leave School?—Decidedly; the first six books of Euclid at least.

Would you, in the first year, or the second year, direct them to higher studies in Physics?—Hardly.

Not till the third year?—No.

University of Edinburgh.

Rev. J. Williams.

2 November 1827.

Would you not have them attend the Logic class till the third year?—I would have them attend the Logic class the second year.

When would you have them attend the Mathematical class?—I would have no interruption of their Mathematical studies.

How many hours a-day do you suppose would suffice for the Greek and the Latin in the first year of their attendance, supposing the portion of knowledge you have suggested were required from students before they entered?—I should say two hours for Greek, and two hours for Latin, the first year.

Would you combine any other class with it, during the first year of that Course?—Yes, the Mathematics.

One hour, or two hours, of Mathematics?—One hour.

The second year, how much Latin and Greek would you give them?—One hour a-day would suffice, provided they read privately, under the Professor's direction.

And one hour the third year also?—One hour the third year. I would reserve Moral Philosophy for the fourth year; I do not think that a boy is capable of understanding Moral Philosophy before he is eighteen.

Then, when they come for a degree in the third year, you would not expect them to be Moral Philosophers?—Certainly not. I should say, if they went through the Course I have suggested, they would find their Moral Philosophy a very easy study—a study which they might master themselves, with a good author, without the aid of a Professor.

Do you make any allowance, in any part of the time before the degree, for Chemistry or Natural History?—Not for the general business of the University.

Would you leave that to every body's choice?—Yes. I do not think that Chemistry ought to enter into the Literary part of an University education; it is more professional than general. I would suggest also, that there ought certainly to be Prize Essays for every year—the first, second, third, and fourth, and higher still for the first year after they have finished their Academical Course, when their minds are fresh from their studies, and they are capable of directing their energies towards the elucidation of any Scientific or Literary subject.

Including University Prizes, as well as Class Prizes?—University Prizes, as well as Class Prizes; but their minds will never be well trained for University Prizes, without having previously been exerted in the struggle for Class Prizes.

Do you perceive any circumstances connected with Scotland, which are likely to prevent the inhabitants of this part of the United Kingdom from reaching the same eminence as Classical Scholars, which many of them attained two or three hundred years ago?—Certainly not.

Do you suppose that the prospect of professional promotion discourages any of the natives of this country from bestowing the same attention on their Classical studies which is bestowed in England?—I would say no, provided that Classical knowledge were once established among them. The very same impulse that carries them to the common level of attainments at present, would, if the standard were raised, carry them much higher. In fact, I think that the majority of young men, intended for the Scottish Church, have greater means of attaining Classical knowledge than the generality of English Curates. The time that elapses between their entrance at the University and their regular appointment to a benefice, is often so long, as necessarily to leave much of their time unoccupied; and, when we consider that many of them spend this time as Tutors in private families, it must be confessed that they possess great facilities for making themselves finished Scholars.

You think they have opportunities of private studies arising from leisure?—Yes; and if their studies at the University had been carried to that point, when they cease to be a labour, and begin to be an enjoyment, I have no doubt they would carry them on spontaneously, not merely as an amusement, but also as the means of improving their income. The most distinguished scholars would be sure to gain the most profitable situations in families, and the literary labours of a good scholar are not without their value. The Germans are the best scholars of the day; but there the great scholars scarcely ever turn their attention to the Church: they are mostly confined within the walls of their Universities and Gymnasia. If it were once common for the Scottish young men to be excellent Greek and Latin scholars, it would become universal, because there is no difficulty. The very same time and attention that render them good Latin scholars at present, would, if they were to apply, make them good Latin and Greek scholars simultaneously: it is not the eventual reward, but the immediate distinction, that excites the ardour and rouses the energy of youthful minds. I could state a fact, as connected with my own College: I was the fifth person who took first Honours at Baliol College; and of the five, not one of us ever derived any benefit from the University.

None of them got Fellowships or Livings from the University?—Nothing in the world. One of us is now Master of a school in the West of England; Mr. Lockhart, the Editor of the Quarterly Review, is another; Sir William Hamilton was a third; the fourth is a gentleman who now holds a country living; and it is well known, that many a man struggles hard for the honour, without even a wish to possess the reward.

Some of those you have mentioned, were not looking for any benefit from the English University?—Not the slightest. It bestows a certain distinction; and a young man who finds himself at the head of his year, regards that alone as a sufficient reward.

Do you not conceive that the new Statute for the Examinations for degrees at Oxford, which passed in 1807, and which has been in operation since that time, has produced the most beneficial effects upon the studies of that place?—I may say, that it has altered entirely the character of the English Clergy and Gentry—a change that will be more visible during the next twenty years.

Even in the case of persons who are not destined for Learned Professions, do you conceive that the mode of training most likely to be effectual for sharpening the faculties and enlarging

University of Edinburgh.

Rev. J. Williams.

2 November 1827.

the mind, and particularly for giving precision of thought, is close application to Classical study?—As far as my experience goes, it is by far the most effectual means of enlarging the understanding, and at the same time of improving the taste. I have stated the standard of examination which I should propose at first, previous to admission to the Greek class—confining them to the Elements of the Greek Grammar and the Gospels and the Acts, because any young man in the country might master those to a certain extent, without much assistance.

What Grammar do you recommend as the best Greek Grammar?—I would say, that which has been drawn up for the use of the New Academy. It is partly drawn out according to Buttman, and partly according to Matthiæ. It was compiled about a year ago.

Has the use of it been confined to your Academy, or can you state whether it has been more extensively used?—Nearly 1,100 were printed; and Scotland, independently of the Academy, took 600; London took 90; the remainder were for the use of the Academy.

Is there now a call for a new edition?—They are out of print, and a new edition is nearly ready.

Do you know to what parts of the country the Grammar went, in Scotland; was it adopted in any particular Schools?—Several Schools have adopted it.

Are the rules in English, in that Grammar?—They are.

Having had experience yourself in the other principal Grammars, and having taught some of them, you are of opinion that this is the simplest and the best?—Decidedly; and I have not the least doubt, if things go on as they are now going on, that we shall see Greek Literature flourishing as much in Scotland, as it does in Germany. What we want chiefly at present, is cheap editions of the Greek Classics.

Is it your opinion, that the making of Greek, and at all events of Latin Verses, ought to be more attended to in Schools?—No doubt of it. The making of Latin Verses is one of the most efficient ways of sharpening the intellect, and of gaining a knowledge of the language. Before a boy has produced, by great exertion, two lines, we must consider the immense number of synonyms which must have occurred to his mind, and how many modes of expressing the same idea he must have rejected: so that the very process makes him acquainted, not only with the Vocabulary, but with the idiomatic turns of the language. Latin Versification ought to be regarded as a means, not as an end. At the same time, I may state, that owing to the numbers taught by one Master in this country, I fear we shall never compete with the higher English Schools in composition.

Edinburgh, Wednesday, 7th November 1827.

The Right Honourable the LORD ADVOCATE in the Chair.

[There was not a Quorum of the Commissioners present at the two following Examinations, viz. Dr. Lorimer and Dr. Lee.—Their Evidence was reported on the 9th instant, and ordered to be printed.]

The Rev. *Robert Lorimer,* LL.D., one of the Ministers of Haddington, called in, and examined.

Rev. R. Lorimer.

7 November 1827.

Have you turned your attention to the practicability of extending the Academical Session, in consistency with the circumstances of Students from the middling and lower orders of society?—Yes.

Have you formed any decided opinion upon that subject?—I should think that no Session ought to be under six months; and that for the Junior Classes, it would be advisable to extend the period perhaps to eight months. But I should think it would be desirable that the Parochial Schoolmasters, as their salaries, it is understood, are to be increased, should be a little better qualified; and that those young men that come to College, should have higher attainments in Latin and Greek: I think it is not at all advisable for them to begin the Elements of either Latin or Greek at the University.

You do not think that the prolongation of the Session would interfere materially with any considerable proportion of the Students?—I do not think it would.

In the course of your professional life, you have had considerable opportunities of knowing the circumstances of many of the Students?—Yes.

Both since you were settled and before?—Yes; my attention has been a good deal turned to those subjects.

Did you study yourself at Glasgow, or at Edinburgh?—At both. I studied Philosophy and Divinity at Edinburgh, but Law, &c. at Glasgow.

While you were yourself at College, had you any opportunity of observing whether there was any marked difference, in point of circumstances, between the Students from the Highlands, and those from the Lowlands of Scotland?—No; I do not think there were many from the Highlands, that came here to Edinburgh. There were some poor lads, but in many instances they lived together, two in one apartment, to divide the expense of room-rent, fuel, and candle.

Do you think the difficulties with which some young men from the Lowlands have to struggle, are as great as can be gone through, in any instances, by those from any other quarter?—I should think so.

The county of East Lothian, it is presumed sends a great many to College?—I do not know that there are a great many come from East Lothian; many of the farmers' sons in East Lothian follow their fathers' profession; there are few Students sent from it to the Church.

Is the opinion you have expressed, formed with reference to the average circumstances of the bulk of the Students that come from that part of the country?—Yes.

Do you believe there was a feeling generally, among their parents and friends, that the Session was too long?—No, I do not think it was; it was only five months, and some of the Students, whose circumstances did not permit them to remain, went away earlier. Those that

University of Edinburgh.

Rev. R. Lorimer.

7 November 1827.

had schools, and who put young men to supply their place during their absence at College, found it convenient of course to go away soon. There was no roll called; they might have gone away at any time, and got a certificate at the end of the Session.

Have you known cases where a Certificate has been given, although there has been no regular attendance?—Most distinctly; and so late as last year, I know two instances of a ticket being taken out in one of the Philosophy classes at the beginning of the Session, and a certificate asked at the end of it, and it was got.

And the young men had not been attending?—They had not been attending; they were in families in the country. One of the young men employed a friend who attended the class, to know what were the subjects prescribed for Essays, and he wrote an essay and sent it in, which made it pass as if he had attended.

Do you suppose that cases of Students getting out their tickets for the Philosophy classes, and not attending, are not unfrequent?—I can only speak as to my own experience; but those young men told me what they had done, and they understood that it was practised by others in their circumstances. But were there two or three examinations in the week, the time and trouble of calling a roll every day would be saved, and besides other great advantages, the regular attendance of the Students would be secured.

What length of course would you recommend for Students of Divinity; how many Sessions do you think they ought to attend regularly?—Three full Sessions. It is high time that a start should be made for higher distinctions in the Sacred Literature and qualifications of the Ministers of the Church of Scotland.

Is it your opinion, supposing any change should be made, such as you now recommend, that any considerable proportion of those whom it is desirable to see enter the Church, would be excluded?—There, no doubt, would be some that would find it inconvenient, particularly at first, till they made arrangements for it, as Teachers of Schools and Tutors in families. But those that keep schools, might make some arrangements for their absence. It would be more difficult for those in families, to be sure; but were they not to go into such situations, till their own education were completed, they would be better qualified for fulfilling the important duties of a Tutor.

You do not consider that the circumstances of the Students are any serious objection to such an arrangement?—Many Students would have private teaching during the Session of the Colleges, sufficient to subsist themselves; at any rate, as there is no lack of Candidates for the Ministry, a public good should not be made to give way to a partial and temporary inconvenience. On no account ought partial, or rather non-attendance on the Lectures of the Theological Faculty, to be permitted; such a mode of education would not be tolerated in the Medical or in any liberal profession.

Do you think the inconvenience would be such as to exclude any considerable proportion?—There is such a number of Students, far more than the Church requires, that I do not think it would have any considerable effect on the proportion of Students, or unfavourable influence on the interests of the Church.

In the course of three regular and complete Sessions, would you include the teaching of any other branches, besides those which are at present thought indispensable?—I think it would be an important addition to the course of Theological Study, to have a Professorship of Biblical Criticism instituted. This seems to be the more necessary now, from the turn which Sacred Criticism has taken among the learned on the Continent of Europe (I allude to the Neologists), and which, from the increased intercourse, is likely to find its way into this country, and if not met or counteracted by sounder principles and canons of criticism, may do much mischief. Instruction is also wanted on the Geography of the East, the Antiquities of the Hebrews—their language, poetry, customs, manners, &c., which would greatly serve to illustrate the Scriptures. It would likewise be very useful to have the Students instructed in the nature, government, and discipline of the Church, and in the qualifications and duties of her Ministers. It may not be improper to remark, that as all these branches of education are embraced by the scheme of study pursued at the dissenting Theological Seminaries in this country, it were a great reproach, as well as manifest disadvantage to the Established Church, to have her Clergy worse educated and inferior in professional attainments to those who dissent from her communion; and it should be remembered, that if the minds of Students are not specially turned to such subjects in their preparations for the Ministry, it is very questionable if they will ever find leisure to prosecute them after they have entered on the multifarious duties of a parochial charge in Scotland.

Do you think that there ought to be regular Examinations in the Divinity Class?—Most assuredly, and in all the Classes twice or thrice a week; and also Essays written upon the principal subjects.

Besides the Discourses required by the Church?—I should think so. More good is to be expected from exciting, directing, and exercising the powers of the mind, than from the *quantum* of knowledge communicated. Five hours of *mere Lectures* in the week is not likely to make great proficients in any Science: a diligent Student will devote as many hours *in a day* to reading and study. By Examinations and Exercises, the Professor would be best able to give certificates of the attendance, talents, and attainments of his Students.

Are you at all acquainted with the expense of living, of the poorer class of Students attending the College?—Not exactly.

6.37

University of Edinburgh.

Rev. Dr. Lee.

8 November 1827.

Edinburgh, Thursday, 8th November 1827.

The Right Honourable LORD BINNING in the chair.

The Rev. *John Lee*, D.D., Minister of Lady Yester's Church, Edinburgh, was examined as follows:—

You have had occasion to be acquainted with the practice of the Universities of Scotland, both from your own studies, and from your subsequent investigations?—I have had very extensive opportunity of acquaintance, both with the ancient and modern state of the Universities.

At which of the Universities were you educated?—At the University of Edinburgh, which I attended eleven years, from 1794 to 1804 inclusive.

Is the practice of the Latin and Greek Classes nearly the same now as it was at the time you attended?—I can scarcely venture to say that it is the same, or nearly the same, not having had personal opportunities of observing the method of proceeding of late; but I rather believe, that when I attended, the Examination was much more minute than it is now—at least, to the best of my recollection, not one of the Students, in the Greek class in particular, was examined less frequently than three times in the week; no doubt, the numbers were not so great as they are now; but in other respects, I am not aware of any material difference.

Did you experience great disadvantages from the want of Examinations and imperative Exercises in the Philosophical classes?—I certainly am convinced that a great deal more would have been done, particularly by the Students of Moral and Natural Philosophy, if there had been Examinations, and if Exercises had been prescribed. From the want of these in the Moral Philosophy class, I have felt inconvenience oftener than once since I left College; for (not to mention other considerations) as the subject is one to which I was more partial than almost any other, I might have had some opportunity of becoming known to the Professor during an attendance of three complete Sessions, if there had been Examinations and Exercises. I had occasion to ask a recommendation from Mr. Stewart some years ago, when I had an appointment in view, which, in my apprehension, would have been secured by the favourable testimony of one whose name is deservedly so highly distinguished. Mr. Stewart's answer was, "I cannot presume to transmit a written testimonial in favour of one with whom I am not personally acquainted." He added, indeed, "Although, however, I have not the pleasure of knowing you personally, I am no stranger to the extent and variety of your literary attainments; and the flattering accounts I have received from some of our common friends (in whose judgment I have entire confidence) of your philosophical turn of mind, would make me happy to see you placed in a situation where you would have it in your power to prosecute your favourite studies with an undivided attention." The letter contained other expressions indicative of a favourable opinion, but I never produced it, as Mr. Stewart could not say that he knew me personally. Now, though I derived much greater benefit from Mr. Stewart's Lectures than from some other classes, in which there were frequent Examinations and numerous Exercises, I cannot help saying, that it is a very great hardship that a young man, though ever so much devoted to study, should be quite unknown to the Professor whose lectures he attends; and it is rather vexatious to think that he can obtain nothing more than such a Certificate of attendance as may be obtained by one who has been as negligent as possible, or who has not even been personally present five or six times, if at all, during the whole Session. I cannot say that it appeared to me, or that to this hour it appears to me, that the practice in the Logic class, in respect to Examinations and Exercises, was by any means deficient; inasmuch as Dr. Finlayson, besides giving most excellent Lectures, prescribed many subjects for Essays, and had Examinations two days every week. They were not imperative, however, but almost all who could conveniently attend, or in fact were not prevented by the necessity of being present at another class which met at the same hour, were examined, and pretty strictly.

Were those Examinations at a separate hour?—At a separate hour. Two additional hours were given at least every week; and during one of the two sessions when I attended, he had two other hours in the week for lectures on General Metaphysics, to which (if I am not mistaken) Students who had previously attended, had free access. The number of Exercises prescribed in the course of the winter, I think, might be about six at the utmost. A very great proportion of the Students performed those Exercises, and, I believe, in general, with very considerable care. I have reason to be partial to the system pursued in this Class, as it was the means of introducing me to the favourable notice of Dr. Finlayson, to whose good opinion I was indebted for several steps of preferment; and, indeed, I may trace all my success in life to the friendship of those Professors whose inspection of their Students was the most minute, and who required the most rigorous account of the attention paid to their instructions.

Have you occasion to know, that most of the Philosophical Classes in the College of Edinburgh met oftener than one hour a-day formerly?—I do know, for certain, that a little before the middle of the last century, some of the Philosophical classes met three hours in the day. There is an account of the University of Edinburgh in the Scots' Magazine for August 1741: and I have good reason to believe, that the account of the classes which is contained in that volume, was furnished by the individual Professors. My reason for thinking so is this: I have here, in the handwriting of Mr. Macky, the Professor of History, a paper endorsed thus, "Magazine, August 1741—Account of my Colleges." This paper contains an account of Mr. Macky's classes, which had been somewhat more extended than what appears in the Magazine; but it is reduced, by including various clauses in brackets, so as to correspond with the Magazine almost exactly; and from this circumstance I infer, that in all probability the others were furnished likewise by the Professors. There are some parts of the account

University of Edinburgh.

Rev. Dr. Lee.

8 November 1827.

which I will state briefly. In the first place, the Classes met for a much longer period of the year than they do now. The Humanity class began on the 1st of October, and continued till July or August; in fact, it continued just about as long as the High School does now, or within a month of the same time. With regard to the class of Logic, it appears from this statement, that it met three hours a-day, and that it began on the 10th of October and continued to the end of May, that is, nearly eight months. I have other authentic accounts of the manner of proceeding in that class, which I conceive to be of importance. I have before me a Memoir of the life of a very eminent person, who died about twenty years ago, Dr. Carlyle of Inveresk, written by himself, in which he states, that he went to the Logic class in the year 1736, "which class was taught (I quote his words) by Mr. John Stevenson, who, though he had no pretensions to superiority in point of learning and genius, yet was the most popular of all the Professors, on account of his civility and even kindness to his Students, and at the same time the most useful; for being a man of sense and industry, he had made a judicious selection from the French and English Classics, which he gave at the morning hour of eight, when he read with us Aristotle's Poetics and Longinus on the Sublime." (I may here state, that the class at that time included Rhetoric as well as Logic.) "At eleven, he read Heineccius's Logic and an Abridgment of Locke's Essay." (This was Wynne's Abridgment.) "In the afternoon, at two, he read to us a compendious History of the Ancient Philosophers, and an account of their tenets. On all these branches we were carefully examined at least three times a-week. Whether it was owing to the time of life at which we entered this class, being all about fifteen years of age or upwards, when the mind begins to open, or to the excellence of the Lectures, and the nature of some of the subjects, we could not then say; but all of us received the same impression—namely, that our minds were more enlarged, and that we received greater benefit from that class than from any other. With a due regard to the merit of the Professor, I must ascribe this impression, chiefly, to the natural effect which the subject of Criticism and of rational Logic has upon the opening mind." A similar account of this class has been given by Dr. Erskine, in an Appendix subjoined to a Sermon on the death of Principal Robertson, and also by the late Sir Henry Moncreiff, in his Life of Dr. Erskine. Mr. Stewart, in his Life of Dr. Robertson, without entering into equal detail, has stated, that to Dr. Stevenson's "valuable prelections (particularly to his illustrations of Aristotle's Poetics and Longinus on the Sublime), Dr. Robertson has been often heard to say, that he considered himself as more deeply indebted than to any other circumstance in his Academical Studies." Here I cannot help expressing some surprise at the unqualified manner in which the late venerable Professor Jardine has spoken, as if the practice of most of the Scottish Colleges had been, and still were, for the Professor of Logic to meet his Students one hour only each day, for five or six days a-week; and as if Lectures were still delivered on the Logic of Aristotle, or on some one of the Synopses or Abridgments of his system. In point of fact, the Logic of Aristotle has scarcely been a subject of Lecture in Edinburgh since the year 1730. In Aberdeen, it has been discarded since 1751, when Dr. Reid was appointed to the one College, as Dr. Beattie was soon afterwards to the other. And in St. Andrews, it has been equally neglected since the appointment of Dr. Watson as Professor of Logic, about the year 1756. In two Universities besides Glasgow, it has also been the practice of the Professor of Logic to meet oftener than one hour a-day, and to prescribe numerous Exercises, as well as to hold frequent Examinations.

Does it appear that, generally speaking, the other classes met as many hours as the Logic class did in the time of Professor Stevenson?—Some of them certainly did. I have reason to think that the classes of Languages met at least as frequently; Natural Philosophy began the 10th of October, and continued to the 1st of June. I do not know that the Moral Philosophy class met so frequently as the Language classes, or Logic; and it then continued exactly six months. Sir John Pringle was Professor at that period, and gave a very extensive Course on Pneumatology, Ethics, theoretical and practical, and the principles of Civil Government. He also prescribed to his students Discourses on important subjects, which were delivered before the Principal, and with open doors. I believe, at the time when Dr. Ferguson became Professor of Moral Philosophy, which was in the year 1764, the class met only once a-day, from the beginning of November to the middle of April, and from that period, if not sooner, the Examinations seem to have been discontinued; but written Exercises were still required, and very generally given in during his incumbency; but not, so far as I know, in the time of his successor. The number of Lectures given by Dr. Ferguson in 1766, was 102.

Were any catalogues called in your time?—No catalogues were called; but in the Greek and Latin classes, a Censor was set in a conspicuous seat, who took notice of absentees; and in the Greek class in particular, places were permanently allotted to the students in the several benches, so that the absence of one or two could very easily be marked.

Do you know when the alteration in the length of the session was introduced, and how?—I do not know when it was introduced, or how. I rather think there has just been a gradual reduction of it. I do not understand that there ever has been any authority for diminishing the length of the session in this University. I may state, perhaps, as a matter of opinion, that about the year 1740, soon after the rise of the secession from the National Church, a greater number of persons than formerly began to attend College, with a view to the study of Divinity. Those who intended to become Preachers, in connexion with the secession, were not bound by the same strict rules which had been understood to apply to students of the Established Church; and though their application, while they continued their attendance, was often very intense, it was no uncommon thing for them to withdraw earlier than others. A diminution of the numbers towards the close is supposed to have afforded a pretext for shortening the session.

6,39

Do you understand that the length of the session was fixed by any of the former visitations, or by any acts of the Town-council?—I cannot, at this moment, state very exactly that it was fixed in this University in either of those ways; but I know that it did correspond with the length of the session in the other Universities; and in all these, about the period of the Reformation, and for more than 100 years after it, the session was not of less than ten months' duration, and in some cases, eleven months. At the commencement of the last century, about nine months was the usual length of the session; and apparently down to 1741 in this University, the session was at least eight months in most of the classes. I perceive that the Medical classes did not meet so long, but the School of Medicine, at that time, was only in its infancy. I have likewise to state, on the authority of the same Manuscript to which I formerly referred (Dr. Carlyle's Memoirs), that at that period "all that the Regents could demand for a session of the College, was one guinea from the 1st of November to the 1st of June;" probably that time might be considered as sufficient to entitle a student to receive his certificate of regular attendance. It appears quite evident, that the Humanity class, and I believe the first Greek class, were understood to meet for a much longer period. I could easily state, from the notes which I have taken from the Diet-books of some Colleges, what was the exact length of the session from the Reformation in 1559 down to the end of the last century; but it may be sufficient to refer to the period intervening between the Revolution in 1688 and the year 1745; and it must be recollected that, during the early part of that period, Scotland was considered as being in a state of great poverty. The sessions of St. Salvator's College, St. Andrews, were as follows:—

From Oct. 29, 1689,	to July 20, 1690.	From Oct. 30, 1697,	to July 12, 1698.
30, 1691,	22, 1692.	31, 1698,	12, 1699.
29, 1692,	22, 1693.		
31, 1693,	14, 1694.	From Nov. 1, 1733,	to July 1, 1734.
31, 1694,	20, 1695.	1, 1735,	1, 1736.
31, 1695,	24, 1696.	Oct. 11, 1736,	to June 9, 1737.
31, 1696,	23, 1697.	10, 1739,	4, 1740.

In the year before the Colleges of St. Salvator and St. Leonard were united, the session lasted from October 10, 1746, to June 9, 1747, exactly eight months.

In 1693-4, the session of St. Mary's College, St. Andrews, lasted from the 7th of December to the 3d of June. In 1694-5, from November 28 to June 1. In 1709-10, from November 15 to April 28. In 1712-13, from November 11 to April 28.

Do you understand that there is any material difference between the circumstances of the students at present, and the circumstances of those who attended this University formerly, the general difference of the times being considered?—I scarcely think that there is any material difference. The expense of living has not much increased during my recollection; I know that the common articles of provisions, when I was a student, were fully higher in price than they are now. I am not sure whether the rents of the rooms may not have advanced somewhat—I believe they have; but in no other respect do I believe there is any difference.

The question had reference particularly to the commencement of the last century?—I can only say that at that period a great number of young persons in the lowest circumstances in life did attend the University, and many of these became very eminent in different professions. I know, however, that there was then a much greater proportion of Bursaries than there has been of late years; in particular, there was a Bursary supported by every Presbytery of the Church, and there were a good many more Bursaries which were paid by Government—from the Revolution, at least, down to about the period of the Union. These Bursaries were capable of supporting young men much longer than the same sum could do now, owing to the depreciation of money.

How do you account for the disappearance of those Bursaries?—I can account for it, I believe, very satisfactorily. I may state, first of all, that Bursaries in the gift of the Presbyteries may be traced almost from the Reformation, and they became universal in the time of the Covenanters, about the year 1641. It was then enacted by the General Assembly, that every Presbytery, consisting of twelve Ministers, shall maintain a Bursar of Divinity; and where the number is fewer than twelve, they shall be joined with those out of another Presbytery where the number exceeds.

So that, for every twelve Ministers of the Church, there was to be a Bursary maintained?—Yes; and in that way, there appear to have been at least seventy Bursars of Theology.

Were those maintained by the Clergy out of their stipends?—The maintenance was "to be taken from the Kirk penalties, according to the design of the first act for maintaining Bursars," and every Bursar of Theology was to have at least £100 Scots. There are various Acts of the Assembly, containing additional injunctions on this matter, down to the year 1701, when it was appointed, that besides the usual Presbytery Bursars, eight Bursars, having what was then called the Irish Language (that is the Gaelic), were to be maintained by the synods, and they were to receive £10 sterling at least. There are many Acts of the Assembly on this subject; but in the year 1737, an Act of Assembly was passed, setting forth, that from the multitude of Probationers in the Church, the reason of maintaining Bursars now ceasing, the obligation on Synods and Presbyteries to support Bursars as students in Divinity, is superseded, until the Assembly see fit to revive the same. Many Presbyteries, however, did continue the Bursaries; and in the year 1756, the above Act of 1737 was repealed, and some new provisions were made on the subject. I know one case of a Bursary which existed within the last ten years, which has been discontinued—a Bursary in the Presbytery of St. Andrews, amounting to about £18 sterling a-year; but it had long been misapplied—instead of being given to a student of Divinity, it had been given to a superannuated preacher, and when this person died, the Members of the Presbytery almost unanimously resolved to discontinue con-

tributing towards it; the contribution had been made from the funds of the different Kirk-sessions. A few Bursaries of this kind still exist, but probably not one-tenth of what can be ascertained to have existed formerly. There must have been altogether above 160 Bursars of Theology at the commencement of the last century; for in addition to those who were maintained by Presbyteries, I can trace above ninety others; so that really, more than the whole number of students required for the service of the Church might have been, at that period, educated gratuitously.

Though a greater proportion may have got Bursaries formerly than do now, do you suppose there is any such change in the circumstances generally of the students, that they cannot now afford a session of eight or nine months, if they were able to afford a session of that length at the commencement of the last century?—I certainly do not think there has been any such change as to make it at all desirable to reduce the length of the session. The present system has the effect of introducing a very considerable number of inferior scholars, who are not likely to do credit, either to the Church, or to any stations to which they may be appointed. I have not the least doubt that the extension of the session would exclude some; but then I do not conceive that that would be any evil at all. And I am clearly of opinion, that the students who are not destined for any particular profession (sons of country gentlemen, for instance) could much better afford to pass a long session now, than they could have done at the beginning of the last century.

You are acquainted with the circumstances of the students, both at St. Andrews and at Aberdeen?—Very well; and likewise with the circumstances of many who study in Edinburgh.

Having been a Professor both at St. Andrews and Aberdeen?—Yes; I was eleven years a Theological Professor at St. Andrews, and I taught Logic and Moral Philosophy one session at Aberdeen.

Do you conceive there is any material difference between the circumstances of the students at Aberdeen and at Edinburgh, so as to prevent that extension of the session at Aberdeen?—I certainly do not; my conviction is, that there is a greater proportion of very poor students at Edinburgh than there is even at Aberdeen, and the reason is very obvious—a greater number study at Edinburgh, particularly when they arrive so far as to be students of Divinity, in the hope of being appointed to situations as Tutors, or obtaining private teaching. I was very well acquainted with the circumstances of many students in Edinburgh when I studied here myself; and I have not the least scruple in stating, that I believe I experienced as great difficulty myself as any individual who was a student along with me, and I well know how cheerfully students do submit to privations, who are anxious to get forward in their studies, and how much more willing they would be to have the time extended than diminished, if they had reason to believe that in this manner they would be much better qualified for the situations at which they aim.

Have you made inquiries recently, as to what may be the expense at present, at which students can attend during the session of this College?—I have made various inquiries, both of young men who have studied at Aberdeen, and of such as have studied, or are now studying at Edinburgh. When I was last at Aberdeen, I made inquiry of several students who had been in my own class, some of whom, I had reason to think, were among the least affluent of the number, and the class which I taught was the most numerous which had been known in that department of study, consisting of about fifty. I have before me some notes which I made at the time of a conversation with one of them. This young man, now a preacher, stated to me, that he did not think that students in general, even from the poorest classes, would complain of the prolongation of the session as a hardship, if a general rule were made to apply to all the Universities. He remembers the annual expense of boarding and lodging seven or eight years ago: he and another paid £2. 10*s.* a-session for lodging, £1. 5*s.* each, and he does not think more would have been charged for six months than for five; they took the room for the half-year; his whole expense, the first session, including fees, was £16, the fees being between £4 and £5; the price of a gown is £2. 2*s.* The circumstances of this student may be guessed at, when it is stated, that he bought an old gown for 7*s.*, and after using it for four years, he sold it again for 5*s.* This person had been four or five years a teacher himself, before a schoolmaster came to the parish capable of teaching Latin; this had first induced him to think of becoming a scholar. He was a full-grown man before he came to College, and probably could not live so abstemiously as I have known many youths do.

Did that £16 include lodging, board, fees, and all expenses?—All expenses whatever. I have in my hand an answer to several queries which I sent to another young man, who was one of my students, and who is the son of a schoolmaster in the north. In answer to the question, "What do you conceive might be the annual expense of living, among those of your contemporaries who were in the least easy circumstances?" he says, "Generally two students occupy one apartment; among the poorer class, frequently three lodge together, and of consequence, by this arrangement, the expense of living, &c. is lessened. I think the sessional expense for lodging, victuals, coals, and candles, may be fairly averaged at £8; hence, were the session extended an additional month, the expense thus incurred would only amount to the trifling sum of £1. 12*s.*" I have a number of other answers which I have received upon this subject.

Does the other information you have received from Aberdeen students coincide with what you have just given?—Entirely on that point.

From the means you have had of comparing the expenses at Aberdeen with those at St. Andrews, at Edinburgh, and at Glasgow, do you think that the expense is pretty much the same at all the Universities?—I think very nearly the same, but I know that many students contrive to live in Edinburgh during a longer session than that of Aberdeen, even at a smaller

641

University of Edinburgh.

Rev. Dr. Lee.

8 November 1827.

expense than any that has ever been stated to me by students either of St. Andrews, Glasgow, or Aberdeen.

Can you state some instances of that?—I shall mention the instance of a young man who is now attending in the third year of his Philosophical Course, and who, I think, promises to be a very excellent scholar. This young man states to me, that during the two preceding sessions, his expense of living averaged about 6*s.* 9*d.* a-week; this includes room-rent and fire, for which two articles he paid 3*s.* a-week; the amount for 24 weeks, at 6*s.* 9*d.* per week, is £8. 2*s.*, and as the lodging cost £3. 12*s.*, the whole expense of maintenance was £4. 10*s.* He stated, that he had occasionally supplies of butter and cheese from the country, but everything else he bought, and those supplies were to a very small extent. The mode of living in the case referred to was this: He breakfasted on porridge and milk in the morning; he had for dinner, three days a-week, broth and a little meat; on other days bread and milk, sometimes potatoes and herrings; he had tea in the afternoon, but no supper;—and this he stated to be a very general mode of living. He has known some who lived, as he expressed it, more meanly than this,—dining merely on potatoes and a little butter. He knew one young man attending College last winter, who never wore stockings, but merely gaiters; this young man and his companion lived all the winter on 5*s.* a-week each, including room-rent, fire and candles, and sometimes the expense was only 4*s.* 9*d.* This was only about £6 in the six months. I may state, that I have known some students who scarcely ever allowed themselves even candles, and who wrote their exercises, and prepared their lessons, by the light of the fire. Many others do not use fire, except in the evening, and some not even then. This young man stated further, that some of his acquaintances paid 8*s.* 6*d.* and 9*s.* a-week, without appearing to live much better, but they managed worse; in particular, they had often beef-steaks, which are an expensive article.

Have you occasion to know that that young man is a very promising scholar?—I consider him very promising, and I have recommended him repeatedly as a Teacher. I may state how I came to ascertain his merits: I had been engaged two or three days in examining Bursars who had attended College for some years, and who, in order to entitle them to the payment of their Bursaries from Heriot's Hospital, must give proof of making progress in their studies. This young man brought me a letter from the country, stating that he was very desirous of obtaining private teaching; and at the same time he produced a certificate from two Professors. I had been so much struck a few days before by the deficiency in some of the students who had very flattering certificates, that I told him plainly I could not venture to recommend him to private teaching, unless he would submit to be examined; he at that time had been only one year at College. I examined him on the same passages in a Greek author, and in one or two of the Latin classics, on which those more advanced students had been examined by a Committee of Governors of Heriot's Hospital; and I may state, that those young men were examined only on passages which they had read at College; but the appearance which this young man made, though he had never before read the passages, was so very superior to the best of them, that I said, without any hesitation, that I would recommend him to employment if it came in my way; and having recommended him accordingly, I know that he gives very great satisfaction.

Had he got any Greek before he came to College?—He had got a little at a school in one of the Royal boroughs; he had been originally at a Parochial School.

Do you apprehend that the details you have now given apply to the circumstances and means of living of a considerable proportion of the students?—To a great proportion. I believe those who find the greatest difficulty in going on in this very parsimonious way of living, are persons who, before they have become students, had begun to follow some profession, some mechanical profession perhaps, and who, while they were engaged either thus, or in rural labour, had never been accustomed to be stinted in their diet. I may state, as an instance of the inutility of carrying on young men who are not sufficiently prepared for College, and who have no peculiar aptitude for learning, the case of a shepherd from the Border, which was mentioned to me the other day by Mr. Henderson, Minister of Stockbridge Chapel. This person having accumulated a small sum, consisting partly of his own earnings and partly of the earnings of two sisters, both of whom were servants in families in that neighbourhood, thought it would be a very desirable thing for him to devote himself to the service of the Church, in connexion with what is called the Presbytery of Relief. He passed four years of attendance at the Philosophy classes, and four years afterwards at the Divinity Hall, living in such a way that his appearance, according to the representation made to me, was materially changed; he seemed to become prematurely wrinkled, and altogether unlike what he was when he began his studies. Such a person, I have reason to think, is more depressed by abstinence, especially if he has long been accustomed to animal food, than another who has never been much in the use of having regular meals, as is the case with many boys who attend country schools. This person, however, with all his self-denial, made no progress, and when he applied to the Presbytery of Relief for a Licence, they found him totally unfit for the duties which he wished to undertake, and he was obliged to return to his former occupation, much less fit for it than he had originally been, and totally unfit to become even one of the most common Schoolmasters, for he had acquired no learning at all.

At what age was he when he began?—I could not state his age exactly; he was a full-grown man; he had been several years acting as a shepherd. I remember one of my own contemporaries at College, who had been, I believe, a ploughman; then he had become a soldier, and had been many years in the ranks, and after returning to his home, was unwilling to resume the laborious occupation to which he had been bred, and became, as he thought, a scholar, by his attendance at College, and did at last, with much difficulty, obtain a Licence with one of the bodies of Seceders; but his ability was so inconsiderable, and his

University of Edinburgh.

Rev. Dr. Lee.

8 November 1827.

learning so defective, that he never could obtain a settlement, and, I believe, at this moment he is totally unfit even to teach a School.

Adverting to the difficulties which you mention so many students experience, do you conceive that they still would be able to afford an extension of the Session?—I am persuaded that as many of them as it is desirable to bring forward, would still be able to contrive to pass through an extended Session, if they are capable of distinguishing themselves in such a manner as to attract the favourable notice of the Professors, or other literary persons to whom they may be recommended. The probability is, that by teaching, or by some other modes of employment, they might be able to pass eight or nine months as well as they do six; and, in point of fact, all the students from the poorer classes, who, about the third or fourth year of their attendance, obtain teaching, from that moment continue to live in Edinburgh all the year round.

Taking into your consideration the circumstances that you have mentioned, do you think it would be an advantageous thing for the interests of Literature, and more particularly as connected with the Established Church of Scotland, if there were to be a very extensive establishment of Bursaries at the different Universities?—I am not friendly to Bursaries. I think I may venture to state, that of the students who complete their Course in Edinburgh, scarcely any of the poorest ever obtain Bursaries, or ever so much as think of applying for them. I never knew any young men, who laboured under difficulties, who enjoyed Bursaries at Edinburgh.

To what do you attribute that apparently extraordinary circumstance?—They are given to favourites of the individuals who hold the Patronage; and I am not persuaded, that in general it is the practice to proceed on the principle of selecting those that are the most promising, or the most needy.

If Bursaries were to be established, putting the election in the hands of the Professors, to be given to those who pass the best Examination, would that reconcile you more to the establishment of such institutions?—It might, if I was sure that even the Professors would continue, for any length of time, faithfully to apply them according to the original intention; but my experience goes to establish this very unwelcome fact, that even in those cases in which the original regulations of the Bursary were the most strict, Professors have sometimes departed so far from them, as, whenever the Bursaries were of any value, to give them to their own nearest relatives, probably to their own sons, when many other not less promising, and certainly much more indigent, young men were left without them.

Would any security be derived, if new bursaries were to be established, limited to persons in absolute want of such things, superadding always the quality of scholarship to be evinced by Examination?—Unless there were some superior controlling power over the Professors, I would have no confidence in their adherence to any rules, however strict; because I have found, in cases in which Divinity Bursaries were only to be given to Masters of Arts, and Masters of Arts who ought, by the then regulations, to have been strictly examined, yet, whenever a young man had interest to procure such a Bursary, he was, as a matter of course, made a Master of Arts; and besides this, when an Examination was necessary, it has been a very rare thing to decide by comparative trial in the case of Divinity Bursaries. Such a practice has, indeed, long prevailed at St. Andrews, with regard to the small Foundation Bursaries in the United College of St. Andrews; and a similar practice has been of late years introduced at Aberdeen, in assigning a great number of Bursaries, some of them of considerable value.

Supposing means were to be devised, either by such control of the Professors as might be found available, or by vesting the election of the Bursars in hands independent of the Professors, to prevent those abuses, is it your opinion that Bursaries would be advantageous, if given only to deserving objects?—I am decidedly averse to the establishment of Bursaries. I think it rather has a tendency to generate meanness of spirit in those who hold them, unless they are to a certainty given as the reward of merit; but I know, that in my own case, I would have had an insuperable aversion to apply for a Bursary; and in whatever difficulties any relative of mine might ever be placed, it is a thing to which I at least could not reconcile myself. I think it is not desirable that education should be given gratuitously (except the common branches, to those who cannot possibly afford to obtain them otherwise); but I think it is much more objectionable to pay any class of people for receiving the benefit of education; which is, in fact, what takes place with regard to Bursaries. This, however, does not seem to have been the opinion of former times; for I find, that not only were young men supported at College at the public expense, but it was a very common practice to pay their full expense at the Grammar Schools and Parish Schools, and even to pay for their books out of the weekly collections, or other funds of the poor.

In those periods, was there a great deficiency of numbers for supplying the Church in particular?—That has been sometimes assigned as a reason for some of those practices; but I do not think that the deficiency was nearly so great as has been commonly represented; because I know for certain, that this country furnished Professors and Ministers, not only within the bounds of Scotland, but likewise to other Protestant countries. There were a great number of Professors and Ministers in the Low Countries from Scotland—so great, indeed, as sometimes to approach nearly to the number in similar situations in this country.

Might not that happen, in some degree, from the troubles which existed at the period in Scotland?—It might in some degree, but I cannot think altogether; for the same thing had taken place before the Reformation—I mean to say that before the Reformation many Professors had been furnished to foreign Universities from Scotland.

The fact at present being, that there is no deficiency of Candidates for the Church, but rather a superabundance, are you apprehensive that the establishment of Bursaries might tend rather to increase the supply inconveniently?—I do certainly think so. Because the supply of

643

University of Edinburgh.

Rev. Dr. Lee.

8 November 1827.

Preachers was thought sufficient, so early as about the year 1707, a number of Bursaries, which had been established at the Revolution, were withdrawn: for instance, there were formerly nine Exchequer Bursaries at St. Andrews, at £15 each; and all of them were withdrawn except three, which were reduced to £10 each; and the reason assigned was, that there was by that time a sufficient supply of Preachers for the Established Church.

Do you conceive it would be a preferable system, if such Foundations were obtained by young men upon comparative trial, as a reward for their merit, at the conclusion of their studies, to be enjoyed for a certain number of years?—My objection to Bursaries would, in that case, in a great measure cease, if they were appointed in the same manner in which they were under the original foundations of some of the Universities. The persons holding Bursaries of any considerable value generally became Regents, and conducted the young men through a course of study for at least four years; and if any such measure were in contemplation, either to appoint Tutors who might teach particular branches, or rather to appoint Tutors who might assist in carrying young men forward through every stage of their Academical Course, I would think that such a destination of a portion of the public money would be highly beneficial.

But as a means of education, you think it better to leave merit to struggle with all the difficulties which it at present has to contend against, than to aid it by means that appear so questionable as you seem to think the Bursaries are?—I do, decidedly. I do not know, in all my extensive acquaintance, of any individual who ever was checked in his progress by the absolute inability of finding means for carrying on his studies, if he was capable of acquiring, even in a moderate degree, the preparation necessary for the profession to which he aspired. I may state that, in my own case, from the time when I was eighteen years of age, I bore the whole expenses of my education; and I passed through a more expensive education than ordinary, having, about that period, begun the study Medicine, after having been four previous years at College, and in that way attended many more classes than are usually attended by persons in the same condition of life, and not having entered upon the study of Divinity till the year when I finished the study of Medicine.

Then, in that way, you conceive that the expenses of your own education were considerably greater than those of most other young men?—Very much greater than the expenses of those who merely study Divinity, and who do not pay fees. The expense of the class-fees, in my own instance, was greater than the charge for living, though, during two of the years to which I refer, the expense of the most essential necessaries of life was more than double what it has been for some years past—I speak of the years 1799 and 1800. The same sum which would have supported a student five months in the winter 1799-1800, or 1800-1, should support him equally well during ten months in the present times, in so far as the mere article of provisions is taken into account.

Bearing in your mind all that you have said of the difficulties under which the students of Divinity labour, would you recommend that fees should be exacted by the Professor of Divinity?—I think it is reasonable that fees, to a certain extent, should be paid. I know that there would be resistance to such a measure at first; but I am strongly impressed with the opinion, that it would really give greater importance to the study, if it were paid for, and if regular attendance, during a certain number of years, were imperative; and I may state, that even at the time of the greatest difficulties with which I struggled, I resolved that nothing should prevent me from attending regularly. I had repeated opportunities of being appointed to very comfortable situations, when I began the study of Divinity; but (though one of them at least held out most flattering prospects) I declined accepting any of them, because they would have prevented me from passing through a regular course of study; and I have had no reason to regret my resolution; for I obtained a permanent provision long before I was prepared to do any justice to the station in which I was placed; and if I had not studied four regular Sessions, or if I had been sooner provided for, I would have been very inadequately prepared. After all, I must own that my preparation was far too slender.

Is it your opinion, that the greater proportion of the students at the Divinity Hall, in your time, who were at all qualified for the service of the Ministry, could have attended for three or four Sessions, without being excluded by the additional expense that that would have entailed?—I am very sure, at least, that a much greater number could have attended regularly than were ever likely to obtain Churches. I cannot say that my acquaintance was then so extensive as to enable me just to assert that most of them could have attended. I do not see why they should not; and I must say, that almost all of my contemporaries who have distinguished themselves much, since they obtained livings, were regular students, though some of them, I am sure, were obliged to struggle with greater difficulties than beset a number of students who contented themselves with partial attendance.

In short, from your knowledge of the circumstances of those who have come under your observation, you think that the others could not have probably been in much greater difficulties than some of those were?—Certainly, I think so.

With reference to the facilities of education in Scotland, at the commencement of the last century, do you believe that the means of obtaining a knowledge of Greek throughout the country were less at that period, than they are at present?—I do not know with regard to Greek. I believe that Latin was much more generally taught in the Parish Schools then than it is now; but as it appears then to have been the understanding, that Greek should not be taught but at the University, I do not think that there were many instances of young men coming to College about the beginning of the last century, prepared to pass over the Elementary Greek Class; but, at the period to which reference has now been made, the Parish Schools in Scotland were generally taught by persons who were licensed as Preachers of the Gospel. In the year 1690, the Schoolmasters capable of teaching Latin were reported to the

University of Edinburgh.

Rev. Dr. Lee.

8 November 1827.

Parliamentary Visitation. In Edinburgh and the suburbs there were twenty, including five in the High School. In fourteen of the country parishes in Mid-Lothian, there were twenty-three such teachers—two in Duddingston, two in Libberton, three in Inveresk, four in Dalkeith, two in Newton, two in Laswade, and in the parishes of Corstorphine, Currie, Mid-Calder, West Calder, Newbattle, Pennycuick, Cockpen, and Heriot, one each; and of these Teachers, the whole appear to have been Masters of Arts. In the county of Haddington there were at least twenty Schoolmasters, at that time, capable of teaching Latin. I have seen in some parish records the names of very distinguished persons, who acted as Schoolmasters before the year 1700, and I know that families of high rank sometimes sent their sons to Parochial Schools. Thus, I learn from the journal of Mr. Adam Ferguson, father of the late Professor Ferguson of Edinburgh, that in the year 1687, Lord George Murray, son of the Marquis of Athol, learned Latin, along with him, at the Parish School of Moulin. In that Highland parish, more than one Teacher, at that period, had the advantage of a College education; and the Parish School was taught by a succession of persons who became Ministers of the Church. The same remark applies to the neighbouring parish of Logierait, the records of which, from 1640 to 1680, I have lately examined—and I can state, very confidently, that in many of the Lowland parishes, the Schoolmasters were Masters of Arts, and Preachers licensed by the Established Church.

And who were therefore qualified to teach Greek?—Who ought, at least, to have been so qualified, and many of whom, I believe, were qualified.

Is it the fact that a very great proportion of the men who have been the most eminent in the Church of Scotland for Classical Literature, have been taught at the Parish Schools formerly?—I have reason to think so; or at least at Schools in the country, of a description not higher than the Parish Schools. Of the eminent men of the last century, who were educated at Parish Schools, I may mention Principal Robertson, educated at Dalkeith,—Principal Leechman, at Dolphinton,—Dr. Reed, at Kincardine,—Dr. Macknight, at Irvine—all respectable scholars, and particularly Dr. Leechman, who was educated at a very obscure country School, but who was himself, in very early life, the Tutor of several of the most elegant scholars in this country, and among the rest, Mr. Geddes, author of a learned Essay on the Composition of the Ancients. Dr. Beattie, a man of classical taste, was taught at the School of Laurencekirk, as Ruddiman, the Grammarian, had been before him. The Parish Schools, when I was a boy, had declined, I imagine, very much from what they had been formerly. I remember well, that none of the Teachers of the Parish Schools, in the neighbourhood of the place of my nativity, were capable of teaching Latin at all; but it was a very common practice at that time, for a few neighbouring farmers to join in employing a young man who had been at College for a few years, to teach their children; and this person generally bestowed very great attention upon such as began under him to study Latin. I myself attended a school of that description. It was supported by three or four small farmers, whose children, and the other children in the neighbourhood, were taught the ordinary branches of education, and some of them also Latin. Of about twenty children who attended that school, four came to College about the same time with me; two of whom are distinguished Ministers in the Secession Church; another became an Army Surgeon; and another died a Preacher in the Established Church. The Teachers of many of those Private Schools were much better qualified than most of the Parish Schoolmasters, at the time of which I speak, at least in the part of the country with which I was best acquainted. I have known several schools of this kind, and they have generally been admirably taught.

Is it your opinion, in general, that when the Parish Schoolmasters teach Latin and Greek to a proportion (probably a small proportion) of their scholars, that they are at all apt to neglect the duty of teaching the children of the poor reading and writing, and the lower branches of education?—I do not think so. In fact, in the case to which I have referred, as having fallen within my personal experience, the time occupied with hearing the lessons of the boys who were learning Latin, scarcely interfered at all with the other business of the School. We were often kept in, after the others were dismissed, to be heard our lessons; and as we were not attending to the same branches with the others, any farther than probably writing copies, we learned our lessons in the school, while the other children were going on with their tasks not less busily than if we had not been there. If any great difficulty occurred, we applied to the Master, without interrupting him more than a minute or two. I am very much convinced that such a mode of teaching has in many instances been very successful. I do not recollect that any of my companions were inferior scholars to the generality of boys educated then at the High School; and I remember very well that one of them, a relation of my own, Mr. Paterson, now a Minister at Alnwick, made incomparably the best figure as a writer of Essays, when he attended the Logic class a second year. Great justice was done to us, without any bustle, and there was no necessity for overlooking the children who were merely learning reading, writing, and arithmetic.

And you think that the increased emolument, derived from the proportion who are learning Latin and Greek, is not such an object as to lead them to neglect the other children, upon whose fees they are chiefly dependent?—Certainly not. At the time I was at School, from 1790 to 1794, the difference between the fees for Latin, and those for the other branches was so inconsiderable, that it was no object at all; 3*s*. a-quarter was all that we paid for Latin. The whole expense of my education, before I came to College, did not amount to so much as I pay for the youngest of my children now for half a-year. I may say, that so far as my experience goes, the teaching of Latin did not, in the smallest degree, interfere with the other business of the School. The known acquirements of the Teachers, too, gave them a degree of respectability in the eyes of their pupils, much greater than was possessed by men of inferior qualifications and more vulgar habits. I well remember, that for more than one of these rural

teachers, I entertained incomparably greater deference than for any Parochial Schoolmaster of whom at that time I knew anything, or than I did for the Minister of the parish, who was a gentleman of very good education. I may state that one very eminent person was for some time assistant in the School that I attended—the late Dr. Leyden; and I could name other excellent scholars, who have acted in the same humble capacity.

Taking into your consideration the interests of the Church, and the state of preparatory education in this country, do you think it would be possible to dispense with the Elementary Classes in the learned languages in this University, without a very extensive change in that preparatory education?—I think it might be possible, in one way or another. I certainly despair of seeing the Parochial Schools, universally, so well taught, as to prepare boys for passing over the Elementary Greek class; but I cannot see, that after boys have devoted a few years to the study of Latin in the country, there would be any insuperable objection to their attendance for one year at least at a school, either in Edinburgh, or some one or other of the provincial towns, where they might all undergo something like an uniform system of training, to enable them to pass over the Elementary Greek class.

Do you think that, in that way, by one year's attendance at some school either in Edinburgh or any one of the burgh towns, young men might get as much knowledge as Mr. Williams in his examination thought would be proper, so as to read the four Gospels, and undergo a Grammatical Examination?—Yes, I think it would be quite practicable, and quite easy. For my own part, however, I would rather require an examination on one of the Greek Classics—Xenophon for instance, than on the Gospels; because many young men can make out the meaning of any passage in the New Testament, without knowing much of the structure of the original. I am confident, that, by some such system, much more substantial and accurate acquaintance with the principles of the Greek language would be obtained, than can be by attendance at the Elementary class in the College; where the examinations, if the numbers are great, must necessarily be very infrequent, and in some instances too slight.

You do not think that any great difficulty would be found in establishing, in the different provincial towns in Scotland, Schools that would answer the purpose to which you have alluded?—No, I do not. Indeed, I believe, in a good many of the towns, there are schools at this moment which would sufficiently answer that purpose; for instance, in Dumfries, Stirling, Ayr, Jedburgh, Perth, and Inverness, and in several populous villages, such as Dunkeld, Dalkeith, and Musselburgh—not to mention the Institution at Dollar, and the Parochial School of Closeburn, both of which are very amply endowed. Such Schools as these, or rather Schools of a higher order, were intended by the Reformers of the Church of Scotland to have been settled in all the chief towns. It appears, from the first book of Discipline, that it was thought "expedient, that in every notable town, and especially in the town of every Superintendent, there be erected a College, in which the arts, at least Logic and Rhetoric, *together with the tongues*, be read by sufficient masters, for whom honest stipends must be appointed." This was the view of the Reformers in 1560, and it must have been only from the want of funds that their recommendation was not carried into effect. The Church of Scotland, in 1645, required certain articles for the advancement of learning to be observed, one of which was, that "no Schoolmaster be admitted to teach a Grammar School in burghs or other considerable parishes, but such as after examination shall be found skilful in the Latin tongue, not only for prose but also for verse;" and another, though it prohibited "the teaching of the Greek language or any part of Philosophy in Grammar Schools, to young scholars, *who thereafter are to enter to any College*, unless it be for a preparation to their entry thereto," yet allowed any scholar, who after due examination was found equal to the best or most part of the class, to pass on to the next class. At that time, however, there was only one Greek class, and as it met the whole year, or nearly so, the progress made in that time might probably be double what is commonly to be expected now, at the conclusion of the first session. Another regulation was, that none was to be admitted a Student of Greek, unless after trial he was able to make a congruous theme in Latin; and another was, that those who were taught Aristotle (as they were the second year) should be able to repeat *in Greek*, and understand his whole definitions, divisions, and principal precepts. All this could not been accomplished without good Schools.

Are you of opinion that a slight degree of encouragement given to those Schools, and the establishment of a few more, would render it safe, after a certain time, to dispense with the Elementary classes in the College?—Yes, I am clearly of opinion that the thing is practicable; and I am likewise of opinion, that it would tend very much to the advancement of Literature.

You having been a Professor at King's College, Aberdeen, what is your opinion upon the question of an amalgamation of the two Colleges?—I can scarcely say that I have sufficiently considered it, or that, during the short period of my connexion with that University, I had an opportunity of knowing the circumstances of the two Colleges so minutely, as to enable me to enter into a consideration of all the points that ought to be taken into view, when that question comes to be discussed.

Do you apprehend that an Union of the Classes in the Faculty of Arts would render them so numerous, as, in itself, to constitute a sufficient objection to the Union?—The question is perhaps more difficult than may appear at first sight. It is very clear, that the inspection of the Professors over the Students would not be so very close as it is at present, if the numbers were doubled; nor would the examinations, personally conducted by the Professors, be nearly so frequent; but I am not very sure whether it may not be found that the emulation which is excited in a numerous class, has a more beneficial influence, on a considerable number at least, than even the assiduous attention of the Professor to the individual Students.

Supposing that it appeared that there were important objects to be attained in other

Rev. Dr. Lee.

8 November 1827.

respects, by an amalgamation of the Colleges, you would not consider the mere increase of numbers, in itself, such an obstacle as to render it necessary to give up the scheme?—Not of itself. At the same time, if such a plan were to be adopted, I would think it desirable that some means should be found to compensate for the loss of that vigilant attention of the Masters to the cases of the particular Students, which, at present, is found very beneficial—somewhat in the way of providing Tutors, a thing which has been suggested already.

Do you conceive that there are material benefits to be obtained, on the other hand, by the amalgamation which has been suggested?—I really think, that if I had been one of the Professors of either of those Universities, I would have been inclined to favour such a scheme; and the only thing that makes me hesitate about it, is this, that so many persons, for whose judgment I have great deference, and whose experience is much greater than mine can possibly be, appear to think the objections very strong; and I am the more moved by this circumstance, when I take into view, that they are really speaking in opposition to what is their own obvious interest; for their incomes must be very much increased by the increase of the number of their Students.

Upon the subject of Theological Education, do you conceive that the complement of Classes is sufficient in the Scotch Colleges, or are there any additional Classes that you conceive would be desirable?—In some of our Colleges, the Theological Classes are too few; and this evil must be most felt where the Students are most numerous. I think that the number of Professors of Theology in St. Andrews is quite sufficient, if their provinces were more exactly defined than they are. A certain course of study was formerly placed under the charge of every one of the four Theological Professors—indeed, it was at one time intended that there should be five. But this exact distribution of duties has long dropped out of view, in so far at least as relates to the Principal, or Primarius Professor, and the second Master of the New College, both of whom have very often, without any concert, lectured on Systematic Theology; and I do not know of any instance in which they did otherwise, for a very long period back, except in the case of the late Dr. Cook, a considerable part of whose Lectures related to some of the branches of Biblical Criticism, though I do not understand that he ever nearly overtook the whole of that very extensive province.

Is that a department which, in your opinion, ought to form the subject of a separate Class?—Yes; I think it is quite sufficient to occupy the labours of any one Professor, and I conceive it to be in some respects the most important branch of any, and one in which Students may be expected to derive greater benefit from the labour of a Professor than they can expect from the Professor of Systematic Theology. It is a very easy thing to find very good systems of Theology, which may be perused at the Student's leisure; but the kind of training which is necessary to enable a young man to become acquainted with the numerous branches of Sacred Criticism, requires very great assistance from some person who must himself have paid peculiar attention to that department of study. It is the more necessary to have Professors of this branch, as many of the books on the subject are calculated to pervert the principles of those who are not capable of judging for themselves, and who, if their attention be confined to a few such works (probably very ill selected) as they may be able to procure, may be easily led away by the specious views in which several foreign writers have indulged, without any reverence for the authority of inspiration.

Do you conceive, that if more attention was paid to the subject of Biblical Criticism, it would not only tend to raise the attainments, generally, of those intended for the Church, in the Oriental Languages, but would also tend to the greater cultivation of Classical Literature?—I think so; and that is one of the many reasons why I think it so very necessary that something of this kind should be attempted. Biblical Criticism can be but very imperfectly cultivated by any man who is not a good Classical Scholar; though a man may be a superior Classical Scholar, without having acquired much of the knowledge which is essential to the cultivation of Biblical Criticism. It is mortifying to think how much this branch has been neglected in Scotland. In Dr. Marsh's arrangement of Theological study into seven branches, the Criticism of the Bible occupies the first place, and I am sorry to say that, in some of our Universities, this part of Theological study is either omitted altogether, or so transiently noticed as to excite little or no attention; so that many Students finish their course, without so much as well knowing the meaning of the expression. Dr. Marsh's divisions are—1. The Criticism of the Bible; 2. The Interpretation of the Bible; 3. The Authenticity and Credibility of the Bible; 4. The Evidences of the Divine authority of the Religions recorded in it; 5. The Inspiration of the Bible; 6. The Doctrines of the Bible; and 7. Ecclesiastical History.

Do not the two last heads seem to exhaust what is taught generally in the Scottish Universities?—I may say that it was almost entirely so, when I attended this University; but, no doubt, there have been Professors who have paid considerable attention to some of the other subjects.

Is it your opinion that an Elementary Class upon the Evidences of Christianity, before the Dogmatic Theology is commenced, would be of importance?—Yes; it is of great importance at least that this subject should be early attended to, either by the Professor of Systematic Theology, or one or other of the Professors, and that there should be a separate hour for discussing it. I am not, however, prepared to say that I think either the Evidences of Christianity, or the Criticism of the Bible, the most proper subject for the very commencement of Theological study. Neither the one nor the other can be placed in a very advantageous light, so as to be quite intelligible by Students who are unacquainted with the early History of the Church. The Lecturer must either presuppose that his hearers are well informed on this portion of History, or he must anticipate much of the information which they ought to receive in the course of their attendance on the class of Ecclesiastical History. I have long been disposed to prefer something like the order which is followed in some of the

647

University of Edinburgh.

Rev. Dr. Lee.

8 November 1827.

Dutch Universities—namely, 1. Natural Theology; 2. Church History; 3. Principles of Biblical Exegesis; 4. Dogmatics; 5. Christian Morality; 6. Pastoral Duties. I observe, in Mr. Thomson's paper on the Dutch System of Education, that the order observed in the *Athenæa* of Holland is not nearly as good as that which is followed in the *Universities*, containing a course—1. Of Church History; 2. Of Biblical Exegesis; 3. Of Natural Theology. I do not say that I consider the order prescribed in the Dutch System the best possible; but, if it included, more distinctly than it seems to do, a course of instruction on the Evidences of Revealed Religion, I think it on the whole a very excellent one. In Germany, I believe, it has been customary to divide Theology into four branches—1. Expository Theology; 2. Systematic Theology; 3. Historical Theology; 4. Pastoral Theology. I do not know if the branches are studied commonly in this order; but, on many accounts, I would place Historical Theology first, and chiefly, because it forms a preparation for many of the researches of Biblical Criticism, as well as for the proofs of the truth of the Christian Revelation. I have long been of opinion, that instead of studying the various branches of Theology at the same time, or very much at random, according to the discretion of the Student, there ought to be a prescribed order of study. In looking over some of my Lectures on Ecclesiastical History, I find, that about thirteen years ago I suggested a scheme of this kind.

Will you have the goodness to state the nature of the scheme you proposed?—I will furnish a copy in writing, or at least an abstract; for the paper is more diffuse than is necessary for the purposes of the Commission.

"With regard to the order in which Theology ought to be taught, I am disposed to think, that considerable inconvenience results from the practice of attempting to learn all the branches of the study simultaneously, without being required to follow any expressly prescribed course, or to observe any orderly disposition of the several parts of study, other than what depends on the period at which any Student commences his attendance at the Divinity Hall, and the practicability of attending with regularity, or otherwise. It may be some relief to the mind to vary its occupations; but by disregarding method, and flitting by starts from one subject to another, we are in danger of losing all the benefit to be expected from coherent and lucid arrangement; and a great many positions must be taken for granted, to which we have not been led by any process of reasoning. It would be of incalculable advantage to be able to proceed according to some plan, which might not only lead the learner to a comprehensive knowledge of the subject in all its divisions, but which might, at every step of the progress, produce conviction, or, in other words, communicate definite and exact information, which he is not called upon to receive on the authority of the teacher, but which he is prepared either to verify or to reject. It is quite possible, and not uncommon, for a Student to be led by necessity or convenience, to hear Lectures on the Evidences of Revealed Religion, or the proofs of the genuineness and authenticity of particular portions of the Sacred Volume, while he has not the slightest knowledge of those periods of History, or those ancient writings, without discriminating inquiry into which, the determination of all questions relating to these evidences must be resolved into the judgment or credulity of the teacher, or the correctness of the view which he may have taken of such leading facts as ought to be carefully sifted before they are received, as they often are, on second or third rate authorities. In some Universities, a Student may attend regularly three or four years, and still hear only the lectures on one or two corners of the subjects of Theological inquiry, and these probably not subjects which he is well prepared for understanding. In such cases, the Professor has probably commenced his labours with the intention of giving as full a discussion of every point on which he enters, as if his hearers were to attend him 20 or 30 years. In other cases, Professors of Theology give a Course of Lectures which occupies two Sessions. When a Student enters on the study of Theology under such a system, it is quite possible that he may hear, from the Professor of Systematic Theology, the lectures on the second division of the Course, which lectures cannot probably be very intelligible to one who has not heard the preceding part, and who may never have read a word on the subject. The Student perhaps finds it convenient to intermit his regular attendance for a year; and when he returns, he hears the same lectures as before, without having even acquired the knowledge which ought to have prepared him for receiving benefit from these lectures. But, besides this, it is to be observed, that as it is not generally understood that Theological Professors, in the same University, arrange the plans of their lectures so as that one set of instructions may be obviously and directly subsidiary to the others, it is possible, that, during one Session, two or three Professors may be lecturing on subjects nearly allied to one another, but in an order so different, as to confound and bewilder, rather than instruct. If a Professor's Course of Lectures extend over four Sessions, as is very generally the case, it is only one in four of the Students who has the opportunity of beginning at the beginning. The Students of the first year may probably find, that, for their purpose, the lectures are not sufficiently elementary; and the Students of the last year, if they have made due progress, may have some reason to think that the instructions are too puerile. Even when the Professor's lectures are attended in the order in which they were prepared, it is quite possible that a majority of the Students may be destitute of the knowledge which they ought to have possessed before they entered on this part of the Course. I have already referred to the Evidences, and I may extend the remark to other branches. How preposterous is it to think, that the Criticism of the Bible, and the rules of Hermeneutics (when taught at all), can be understood, or duly estimated, without a considerable store of ancient learning, and an acquaintance (more enlarged than Students in general are entitled to claim) with the manners, customs, and opinions of early times, with the character of ancient authors, and the contents of their undisputed and most valuable writings, as well as the qualities of their style, and the peculiarities of their views, with regard to matters of belief and practice. I shall, in the sequel of this Lecture, have occasion to show, that every inquiry concerning the early reception of the Sacred Books, as Canonical, must be decided by the knowledge of Christian Antiquity. But, how fortuitous soever may be the position in which the several parts of Theological instruction are often brought under the notice of the Student, the disadvantage must not be ascribed to the original framers of the methods of study in this country, nor, in general, to those who have conducted those important branches of education. Our Church is supposed to have become more easily satisfied than formerly with the measure of systematic preparation requisite for the due discharge of the sacred office; and it is to be apprehended that a general prejudice has arisen against the ponderous erudition, with which our fathers were furnished, as if it were so

University of Edinburgh.

Rev. Dr. Lee.

8 November 1827.

much useless lumber. The Reformers of this Church directed that the Academical studies, essential for a Minister of the Gospel, should be carried on in a prescribed order for nine complete years at least—and that the branches of study, strictly Theological, should occupy five of these years, without any intermission. About twenty years after the Reformation, a plan of Theological instruction was established in one of the Universities, by Act of Parliament, at the suggestion of the leading men in the Church, and this plan required a close attendance of *four years* (eleven months at least every year) under five Masters, whose provinces were assigned to them, and who were to teach the various subjects in a particular arrangement, which, though it may be liable to some objections, possessed unquestionably many substantial advantages. While we are without any statute on the subject, it is to be feared that many will travel along the least laborious path; and it unhappily must be expected, that Teachers, who find that their services are underrated, and their most zealous endeavours frustrated, by the indifference of those who have the greatest need of instruction, will, in many cases, remit the labour which is so unprofitably thrown away. I despair of seeing a strict Course of Study authoritatively enjoined; and yet I cannot refrain from offering some hints for the guidance of those who are intent on their own improvement. I do not undertake to point out a method, which shall be liable to no objection; and I admit that the same object may be gained by methods which are very dissimilar. But I venture to think that the following views may be useful to those who, instead of having formed regular habits of study, are accustomed to satisfy themselves with casual and desultory fits of attention.

"After having laid the foundation of Natural Religion, by surveying the great doctrines concerning the Being of God, the responsibility of Man, the power of Conscience, the sources of Happiness, and the sanctions of Duty, to all which it is the province of Ethics to introduce the mind,—the first business of the Theological inquirer is to form a familar acquaintance with the languages of those inspired books which unfold the primary and essential articles of our most Holy Faith. The correct knowledge of these tongues is indispensably requisite to a full understanding of the Sacred Oracles. The ordinary routine of Academical instruction, though generally thought more than enough as a preparation for entering on a Course of Divinity, may have been very successfully followed out by many a one who is not yet qualified to understand the original language of the New Testament. The narratives of Matthew and Luke are written in a very different style from those of Xenophon and Plutarch. A man who understands the idiom of the classical biographers, may find many obscurities in the expressions of the Evangelists; though, upon the whole, it is impossible to name any writings more remarkable for simplicity and artlessness, and that noble perspicuity which disdains the aid of superfluous ornament. Still wider is the difference between the speculations of Plato and the Epistles of Paul, considered merely as specimens of composition. In short, the language of the New Testament is not to be acquired, without a patient and diligent perusal of the whole volume; and with respect to the language of the Old Testament, it is well known that no other book, worthy of being named, is now to be found written in it. Sacred Philology, therefore, including minute and correct grammatical knowledge, should be one of the first subjects of inquiry.

"With respect to the language of the New Testament, I may add, that it would probably be better understood than it generally is, if, instead of using the Greek Testament in schools, as the first book which is read in the language, the practice were adopted of postponing it till after an adequate knowledge has been gained of the classical models, particularly the historians. And indeed it might be attended with no small benefit, if the principles of Hebrew Grammar were learned by every Student, before he attempts the reading of the New Testament in the original. By this method several advantages might be gained. Many peculiarities of diction, which we are apt to consider as anomalies, would be found to be reducible to general rules of grammatical construction—rules which, though not frequently exemplified by authorities purely Grecian, are nevertheless perfectly consistent with the universal principles of written language, and conformable, in many particulars, to the syntax of that most ancient and venerable tongue which has transmitted to the latest ages the primitive history of man. On this subject much useful information may be derived from Vorstius de Hebraismis Novi Testamenti, and the first volume of Masclef's Hebrew Grammar, as well as from Leusden's Philologus Græcus, and Glassii Philologia Sacra. A different view of the subject may be found in Blackwall's Sacred Classics Defended. (Since this Lecture was written, Bishop Jebb's work on Sacred Literature, published in 1820, has applied the principles of Bishop Lowth, in his Lectures on Hebrew Poetry, to the interpretation of the New Testament.)

"An acquaintance with those Antiquities which afford illustration to numberless passages in the Old and New Testaments, is intimately connected with the study of the sacred tongues. The institutions, laws, and usages of the Greeks and Romans are described at great length by various authors, with whose writings every scholar is in some measure acquainted. But though no Student of Theology should be ignorant of those works, it is much more necessary to attend to the Antiquities of the Hebrews, than to those of any other nation. Almost all the books which treat of this subject, contain an undue portion of Rabbinical learning, which often confounds and misleads, while it professes to communicate instruction.

"At an early period of Theological study, it is highly important to acquire a correct knowledge of the history of the doctrines and practices of the primitive Church. The writings of the Fathers and Christian Apologists, by their numerous quotations, enable us to ascertain, with considerable precision, what were the universally received Canonical books, and what were accounted the genuine readings in those passages which have given rise to the most numerous disputations. Many other substantial advantages are gained by tracing the history of religious opinions; some of which I shall afterwards state.

"At this stage of a Student's progress, he may derive much benefit from reading the Introduction to the New Testament, by Michaelis, translated by Dr. Marsh. The works of Dr. Lardner should also be carefully studied—and it would be highly beneficial if he had the opportunity of hearing Lectures on the subjects of which these eminent authors treat; for many particulars worthy of attention may escape him, and in some he may be misled, if he has not the advantage of studying under the direction of an experienced guide.

"But without enlarging on the most eligible mode of pursuing these preliminary studies, which are by no means to be discontinued after we have reached the more advanced stages of our undertaking, I must earnestly advise every Student to dedicate the chief share of his attention to that great assemblage of revealed truths which has been unfolded in the Scriptures, and which it is the province of Theology (properly so called) to dispose and embody into a harmonious system. It must be owned,

that much false refinement and mistaken reasoning have sometimes been employed in methodising the doctrines of Christianity. For many ages, the sound rules of logical analysis were almost entirely disregarded, and it was the great aim of every Theological writer to reduce the articles of faith to an artificial arrangement, borrowed from the practices of the ancient schools. Though, in this manner, much was occasionally done to obscure the Sacred Writings, it is not to be denied that systematic knowledge is of the highest importance, and that wherever it is wanting, perplexity and indecision will be found to prevail. It is certainly material that every one who is to teach the doctrines of Christianity, should examine, throughout all their divisions, the general received articles of belief, which have been incorporated into the standards of the National Church of which he is a member, and it is unnecessary surely to say, that it would be dishonest and deceitful to subscribe these articles, without being prepared conscientiously to defend them. In surveying this extensive and connected scheme, it is requisite to subject the arguments and authorities for every clause to the scrutiny of a sober and impartial criticism—taking care, however, not to decide on the evidence for detached portions considered disjunctively, till the whole has been patiently and carefully reviewed. Difficulties which strike us forcibly when our attention is confined to a single point, often disappear when our minds are qualified to take a more extensive range. In judging of the separate parts, we may often think that we have detected errors; and yet, when we proceed furher in our investigations, we may discover that what seemed most defective, is not only reconcileable with the general system, but is a necessary constituent, which cannot be removed without impairing its beauty and detracting from its perfection. One of the principal uses of systematic study is, to enable the learner more easily to connect in his mind those multifarious and extensive topics, which without some such help might appear only an incoherent mass.

"It is not to be disguised, that a steadily continued course of study, extending to not less than three or four full Sessions, is of the highest consequence to every one who aims at that proficiency which is not less essential to his own comfort and credit, than to the advantage of those whom it may be his lot to instruct. It is not unlikely that the fame of some of the most admired preachers of the last century has contributed to the depreciation and decline of Theological Literature. Their distinguished success in treating the principles of morals, and in describing the refinements and enjoyments of piety, and the exquisite address with which they contrived to touch the heart and to delight the imagination, by the artifices of a polished style, and the ingenious attractions of philosophical disquisition, raised up for a time a numerous tribe of imitators, who did not reflect that it is impossible for every one to attain distinction by following a line of investigation which has already been thoroughly trodden, and that when the riches of one field have been nearly exhausted, it would be wiser to attempt the cultivation of another than to waste their labour in preposterous efforts to execute what has already been sufficiently accomplished. As there has always been a diversity of gifts, it is expedient to encourage the varied operations by which different departments of learning may be most effectually improved; but much more is lost than gained, by applying all our energies to one or two subordinate branches of study. Some subjects are of such vital importance as to claim the attention of all, and it is not possible to be profoundly versed, even in a single part of any Science, without having enlarged views of the whole. It is certainly quite practicable, and by no means difficult, to deliver agreeable and elegant declamations concerning the excellence of knowledge, the dignity of truth, the beauty of virtue, the power of conscience, and the misery of guilt, without having bestowed much attention on the fundamental doctrines of the Christian Religion. But such general discussions, though they may be pleasing, and occasionally useful, are not sufficient for the purpose of bringing men to recognise the obligations and sanctions of the Divine Will in their full extent—and no moral admonition can be expected to reach the heart with due efficacy and force, so long as the understanding is not enlightened by clear and connected views of the scheme of grace and truth disclosed in the Gospel. He who has acquired the capacity of at once convincing and persuading his hearers, must have looked beyond the mere elementary outlines of Christianity, so as to be able to trace, with a discriminating hand, the inseparable intimacy between truth and righteousness, and to show how it is, that all that is most amiable in charity, as well as all that is unbending and unsullied in probity, must flow from a pure heart and a good conscience, and faith unfeigned. It is not by appeals to so fluctuating a standard as feeling or fancy, that the characters of men can be established, or their happiness secured. The only principles of good conduct are firm, decided and invariable; and without a complete knowledge of these principles, and of the extensive field of learning by which they are capable of being demonstrated and illustrated, no man can be fully prepared for the duties of a Preacher of the Gospel.

"In short, it is essential, *first* of all, That the Student should be sufficiently versed in the Greek and Hebrew Tongues; *secondly*, That he should have studied Ancient History, and particularly the history of the early Church; *thirdly*, That he should have acquired so much of the Criticism of the Bible, as may enable him to render a reason for receiving those books which are esteemed canonical, and for rejecting others; *fourthly*, That he should have learned to apply the just rules of interpretation; and *lastly*, That he should have an enlarged and systematic view of the Doctrines of Christianity. There are various other points which ought to be included in a Course of Theological instruction, such as a view of the principles of Church Government and Discipline, and, particularly, directions with regard to the mode of conducting the public services of Religion, as well as with regard to the other functions of the Ministerial office. But these hints are meant, not for such as are to teach Divinity, but only for those who may not be fully aware of all the questions to which their attention should be turned, and who may not have the advantage of giving regular attendance during such a Course of Academical instruction, as, with all its defects, is incomparably preferable to what is called partial or occasional attendance."

In what way do you think that Ecclesiastical History ought to be taught in an University Class?—It appears to me, that the most useful method is, to divide the study into a certain number of branches, any one of which can be studied independently of the others; for instance, a very important part of the subject of Ecclesiastical History relates to the ancient Dispensations of Religion, the Antediluvian State, the Patriarchal State, the Mosaic Economy, and so on. This may form a very useful subject for one Session, illustrating equally the History and the Prophecies of the Old Testament. Again, with regard to those periods of Church History which are included under the New Testament Dispensation, a very considerable proportion of one Session may be occupied in giving an account of the state of learning and of religious opinions at the period of the Advent of our Saviour, and of the most material

University of Edinburgh.

Rev. Dr. Lee.

8 November 1827.

facts which occurred during the lives of the Apostles and their immediate successors; but it is not nearly so important to give a minute history of external events, as to give a faithful representation of the sentiments of the leading individuals in the successive ages of the Church. But the mode of studying Church History may be best described, after giving a brief view of the principal objects which ought to be kept in view by those whose office it is to assist the studies of others in this important branch of knowledge. I can undertake to do little more at present than to state my own method, which indeed was not exactly what it would have been, if I had not considered it my duty to diffuse my instructions over four Sessions, during which period it was the practice of most of the Students of St. Mary's College to give regular attendance; and I therefore distributed my materials into four parts, any one of which might be studied, without a very minute knowledge of the others; though I would have preferred to introduce every Student, in the first place, to an acquaintance with the history of the Ancient Church, and then to communicate, in a second Session, all that can well be taught in Lectures on the Establishment of the Christian Church, and the progress of Religious Knowledge till the time of Constantine,—in a third Session, the history from the time of Constantine to the Reformation; and in a fourth, the History from the Reformation to the present time. My opinion is, however, that it would be very much better to lecture on Church History to the Students of Theology of the first and second years,—having a set of Lectures delivered to each of these two Classes every year,—and it would be no difficult matter for any man acquainted with the subject, so to conduct the Class as to relieve the Professor of Systematic Theology of a great part of the labour with which he is at present encumbered. As I have not leisure at present to prepare a well-digested scheme, I hope I shall be allowed to lay before the Commission a few notes from the introductory Lectures which I delivered in 1812 and 1813, on the advantages which may be gained by the study of the most important branches of Ecclesiastical History, and on the manner in which the study should be pursued for the purpose of securing these advantages. The paper must have a meagre appearance, as I have omitted in the transcript almost all the illustrations of my peculiar views.

Addition to the Evidence of Dr. Lee.

[Two days after the preceding Examination, Dr. Lee was unexpectedly requested to undertake the labours of the Divinity Chair in the University, during the session which was to open the following week, and which did not close till the middle of April. The occupation of his time in this undertaking, and in other professional duties, prevented the immediate fulfilment of the purpose expressed above, and owing to the same circumstance, two of the sheets of his Evidence, after having been detained a considerable time, were inadvertently printed off without having received his final corrections. The following notes have been added after a long interval, but are less full than was originally intended, as the author has other opportunities of communicating his views to the Commission.]

In my apprehension, the purposes for which Ecclesiastical History ought to be studied, have been very imperfectly considered by many Theologians, and it was scarcely to be expected that this branch of knowledge would ever be sufficiently cultivated, so long as the advantages which it is capable of yielding have not been duly appreciated. It is not enough to say, that it possesses all the advantages which are produced by the study of Civil History—the utility of which to the moralist, the lawyer, and the statesman, has been universally admitted. The uses to which the History of the Church is subservient, are still more extensive; and, in adverting to a few of them, we may be able to form a correct opinion of the most profitable method of lecturing on this too-much-neglected subject.

Among the general benefits which may be derived from the study of Ecclesiastical History, the most important appear to be the following:—1. It is calculated to enlarge our knowledge of human nature. 2. It unfolds to us a more ample view of the procedure of Divine Providence, than we are able to gather from our own limited observation. 3. It is serviceable as a guide to the explication of various obscure passages of Scripture, and particularly of the Prophetical writings. 4. It is an essential part of that liberal education which serves to introduce enlightened and unprejudiced views, and to stamp that character of ingenuousness, candour, and forbearance, which is generally most defective in those who are but partially acquainted with the dispositions and habits of men, as they are formed by the circumstances of their condition. 5. This study is necessary, not only as a branch of Theological instruction, but as it is connected with the general history of learning, science, legislation, public economy, and national aggrandizement or decline. 6. It is necessary, to enable us to complete the evidences of Divine Revelation. 7. It may be expected to assist us in establishing and applying the most prudent rules for the preservation of the peace and purity of the Church, and, in short, without this knowledge, we might often be in danger of relapsing, unconsciously, into errors, the disastrous consequences of which have long ago been demonstrated by the bitter experience of past generations.

In reference to these hints, I may observe, that in conducting the study of Ecclesiastical History in the form of Lectures, it is incumbent on the teacher to frame his instructions so as to furnish his pupils with a copious assemblage of the data from which they may be enabled to form a more extensive and correct acquaintance with the character of the human mind. The knowledge of human nature is not to be acquired by random speculation, or by resting satisfied with vague and superficial generalities, but by patient inquisition into the numberless varieties and modifications of dispositions and habits presented to our view in the living world; and still more, by attending to those faithful delineations of inward beauty and deformity, engraven on the monuments of former ages, which the ravages of time and chance have not yet been able to deface. In surveying the memorials of the past, great as are the difficulties which obstruct our researches, it is obvious that many of the sources of false judgment are removed; the cloak of dissimulation is stripped off, and neither the partiality of affection, nor the antipathy of envy and resentment, can so effectually obscure the sight, as when we form our judgments concerning those contemporaries by whom our personal interests may be affected. Moreover, in the page of authentic History we see the entire likenesses of those who have acted the more conspicuous parts—we follow them from the first dawn of their enterprises, through all the gradations either of their prosperity or their reverses, and we do not leave them, till, after having watched the springs and tendencies of their conduct, we have an opportunity of perceiving how their designs corresponded with their performances—how their professions accorded with their practice, and by what

651

University of Edinburgh.

Rev. Dr. Lee.

8 November 1827.

persuasive force of motive and of artifice they employed the instrumentality of others in accomplishing the purposes which they had at heart.

It may be observed, *secondly*, that this study ought to be conducted, so as to afford the most effectual means of advancing our knowledge of the plans of Divine Providence in the moral government of the world. It does not, indeed, enable us to fathom those deep and unsearchable ways which it would be of no advantage for us to understand; but it is not a contemptible or useless research, which furnishes us with abundant proofs of the unceasing operation of a wise and benignant Superintending Mind, which, from the beginning of days, has so arranged the course of events, and so controlled the designs and undertakings of created agents, as to bring light out of darkness, and peace out of evil. In what manner can the intricate scheme of Prophecy be evolved, except by following out the series of occurrences written in the great book of Providence, which cannot be understood in detached portions and insulated fragments, but in that continuity of narrative which displays, not only the chain of antecedents and consequences, but the joints and bands which link effect to cause, and all the collateral accompaniments which may have either quickened or retarded the more latent springs of great transactions?

It may be observed, *thirdly*, that the different dispensations of Religion, and the state of opinions, morals, and institutions in the ancient world, should be at least so far explained as to lead to the correct interpretation of those numerous passages in the Sacred Scriptures which contain historical allusions. The many casual and rash conjectures which have been started by speculative Theologians, with a view to clear up the obscurities in the text, not a few of which have been merely ideal, might convince us of the expediency and necessity of being furnished with some preliminary instruction concerning the actual state of things at the time when the Divine Revelation was committed to writing; and if we are not careful to acquire this instruction, it is not difficult to perceive that our labours will generally prove as abortive as they are hazardous and presumptuous. This observation, indeed, may be supposed to apply to but a very narrow portion of the History of the Church, and to only a few of the least perspicuous expressions in Sacred Writ; but when it is further recollected, that the Prophetical parts of Scripture, as has already been hinted, cannot be intelligible at all, unless we look forward patiently to every succeeding period in the annals of the world, anticipated by the holy men of old, who were moved of the Holy Spirit, we may be satisfied, that it is not possible to obtain that ample knowledge of the Scripture by which the man of God is made perfect, without having formed extensive acquaintance with the various occurrences both of ancient and modern times, to which the books of Revelation either immediately or more distantly refer.

It would be inexcusable to omit noticing another very obvious advantage of studying Ecclesiastical History, to which the Lecturer on this subject must direct a great share of his attention. Among the controversies which have been agitated, with respect to the Articles of Faith, as well as the usages, formularies, and regulations of discipline and internal government adopted by different Churches, it is absolutely necessary, both for fixing our own opinions, and for confuting gainsayers, to ascertain, by reference to authentic testimonies, what was the practice of the purest times, and to be able to unfold the true origin of the numerous divisions, defections, heresies, and usurpations which have harassed and embroiled the Christian world. In the strife for pre-eminence, the partisans of every denomination, however far they may have deviated from the form of sound words, insist so vehemently on the superior strength of their respective claims, that the votaries of truth may be silenced by the arrogant clamour of controversialists, if they cannot invalidate the pretensions of their antagonists, by appealing to documents admitting of no dispute, and by distinguishing the genuine remains of primitive times from the fabrications or mis-statements of later writers.

To all this it may be added, that the study ought to be so conducted, as to expand and liberalize the mind. It is to be expected that many groundless prejudices will be dispelled, by taking a faithful review of the characters and actions of men whose opinions and habits have been so greatly diversified as those whom we have occasion to contemplate, in surveying the History of the Church; while, on the one hand, we see exposed to merited scorn, the disingenuous and crooked artifices of men professing zeal, but practising all unrighteousness, and while, on the other, we are led to admire the meekness, prudence, and magnanimity of those pure spirits who, unmoved by threats and indignities and accumulated wrongs, rejoiced in tribulation, and were patient in hope, resolutely holding fast the anchor of the soul, so as to secure them against making shipwreck of faith and a good conscience. How trivial, too, must many of the causes of disunion among Christians appear to every candid and discerning mind? But, as a compensation for the mortifying feelings to which we are exposed in contemplating them, we gain no small satisfaction from reflecting that, by such sadness as this, the heart may be made better, if, availing itself of the sorrowful experience of those whose lives were embittered, and whose usefulness was impaired by discord and faction, it shall incline us to advance in the exercise of that lovely grace which suffereth long and is kind, rejoiceth not in iniquity, but rejoiceth in the truth—beareth all things, believeth all things, hopeth all things, and endureth all things.

Further, it must not be forgotten that, as for many ages the Christian Church was the great depository and preservative of the treasures of ancient learning, the history of Christianity, during that period of no inconsiderable extent, embraces the whole history of Literature and Science, and is accordingly so incorporated with all that is venerable and dear to a cultivated mind, that, independently of its own intrinsic excellencies, it deserves to be studied for those advantages which are merely accessary. It is pleasing to remark, that while thick darkness overshadowed the earth, and while the most grovelling superstitions oppressed and almost extinguished all intellectual energy, a precious remnant of the human race, cheered by the consolations of the Gospel, and imbibing all that was valuable in the remains of Grecian and Roman wisdom, preserved the generations which were to be born from sinking into total barbarism, and, after having secretly but stedfastly fostered the ardent spirit of discovery, transmitted to happier times that irresistible impulse which ultimately succeeded in breaking the fetters of religious despotism, and exalting prostrate nations to the possession of those immunities, civil and sacred, which we claim as our birthright and the lot of our inheritance.

It is scarcely necessary to hint at the subservience of the study of Ecclesiastical History to the more generally acceptable study connected with the rise and fall of States, and the great political concerns of civilized society. It is only incidentally that these come under the notice of the historian of the Church; but we must have frequent occasion to imprint on our minds some very affecting and momentous lessons, derived from the consideration of the ruinous consequences of an undue interference between spiritual and secular authorities, and such a preponderance of either as destroys the just balance between the powers that be.

University of Edinburgh.

Rev. Dr. Lee.

8 November 1827.

It may be sufficient to add, in very general terms, that whether we desire to be thoroughly supplied with all the evidences for the truth of Revelation,—or to learn the utter insufficiency of Judaism, and still more of Paganism, to perfect men in holiness,—or to discover how far many nominal Christians have formerly departed from the simplicity of the Gospel, through causes which may still be expected to operate,—or to acquire the soundest and safest maxims with respect to terms of communion and the mode of tempering zeal with charity,—or to form an enlightened judgment concerning the best means of checking the growth of error, and repressing the influence of irreligion, it is necessary that we should diligently turn our attention to the history of the Church. Though great benefit may be expected from a survey of the whole field, there are some portions of it which demand a more particular share of notice, and among these it is scarcely necessary to allude to the amazing combination of events which, after the pillars of Christianity appeared to be immovably fixed, contributed to build up the monstrous fabric of the Romish Hierarchy, and the not less marvellous train of circumstances by which, through the gracious interposition of Heaven, some highly-favoured nations were led to cast off the yoke of spiritual bondage.

For the purpose of securing advantages like these, it is not necessary for the Lecturer on Ecclesiastical History to fatigue his hearers with tedious and intricate details. It is enough for him simply to lay before them the connected order of events; and though he may be able only to present them with an epitome, it ought to assume a less meagre aspect than a mere chronicle of dates, a calendar of saints, or a register of the names of heretics and persecutors, whose memorial deserves to perish. It must be difficult to give the essence, or even the outline, of all that may be gained by a careful perusal of the most valuable authors, but it is incumbent on every Lecturer on this subject to do what he can to direct the Students of Theology to the best sources of information, and to guard them against the false inferences which negligent or prejudiced observation might be apt to draw. He ought habitually to remind them that his labours, so far from being intended to render theirs superfluous, can be of very little use, unless they are seconded by their diligent and strenuous exertions, and that the chief purpose of all public Lectures is to stimulate and encourage, to assist and guide, the private inquiries of the Student. It is too well known, however, that many, even of those who appear to be assiduous in their attendance on academical prelections, instead of expanding and following out the hints communicated by their instructors, content themselves with carrying away an abstract of what is only elementary. To dignify with the name of study this partial and passive reception of the general principles of any art or science, is not only a foolish abuse of words, but a most pernicious and flagrant species of self-deception. It is not to be expected that any truths will make a deep and profitable impression on the mind of one who does not think it worth his while to scrutinize the evidence on which they rest, and by his own active application, to add to the borrowed store, which he has contrived to reap without having previously sown.

* * * * * * * *

These are some of the general views with which the History of the Church ought to be studied. Other advantages may be represented as peculiar to a few of the separate parts. Every one who has ever thought of the subject, must be aware, how desirable it is to possess correct notions with respect to the successive Religious Dispensations, communicated to man from the origin of time to the dawn of the Gospel. We cannot easily overrate the importance of taking a deliberate survey of the primeval condition of the human race, and their defection from their Divine Lawgiver,—of the faith by which the Patriarchs obtained a good report,—of the Mosaic economy, and the influence produced by Revelation on the Gentile world, as well as the numberless aberrations of unassisted reason, and the delusions of imposture, for the purpose of enabling us to appreciate the value of the great discoveries and benignant effects of the religion of Jesus Christ. But the consideration of the *early History* of the Christian Church is still more valuable than the retrospect of the preparatory scheme. The highest benefit may be expected from an accurate knowledge of the history of the first three centuries of the Christian æra, while the newly-organized association of believers struggled with persecution, multiplying and growing the more in proportion to the violence with which its progress was opposed; and the succeeding period, when the enlarged family of professing Christians began to number among its inmates the mightiest of princes, and when the faith of Jesus Christ was received as the public religion of the Roman empire, without, however, having completely abolished all the incongruous doctrines and institutions of heathenism, or having maintained such purity as it had exhibited in the disastrous periods when it wrestled with the principalities and powers of the world, and when theological opinions had not begun to be blended with the perplexities of scholastic science, the ravings of the later Platonists, or the subtilties of the Aristotelian dialectics.

The first object, then, to which the early history of the Christian Church ought to be made subservient, is this,—To supply us with materials for ascertaining the authenticity of the Sacred Writings, and particularly for determining with precision the genuineness of the commonly-received canon of the New Testament. From a comparison of the Sacred Text with the writings of the primitive Fathers, and with a number of those profane authorities, on which, when they accord with each other, we can seldom avoid relying, we may deduce the most unquestionable evidence, that the leading facts related in the New Testament are well founded—that the books of the New Testament are the production of the writers whose names they bear—that they were admitted, as possessing Divine authority, in the very first age of the Christian æra—that no other books were ever universally acknowledged, as deriving their origin from Divine inspiration—that the accounts which they deliver concerning the state of both the Jews and Gentiles, are confirmed by the unambiguous testimony of contemporaries—and that owing to the controversies which have ever been maintained, on almost every article of belief, the greatest care has been employed to preserve the Code of Scripture unadulterated, equally secure from being mutilated, or interpolated, or intentionally altered. If we acquiesce in the proofs of the authenticity and inspiration of the New Testament, we must at the same time admit the authenticity of the Old. The law was not destroyed, but completed, by the coming of Christ. All the Old Testament Scriptures are said, in the New, to testify of Christ. Moses and the Prophets are quoted in the New Testament as Divine messengers, whose testimony extended to all the facts relating to the mission, the sufferings, and glory of the Redeemer, insomuch that the Apostle Paul declared (Acts xxvi. 22), that during the long space of twenty-eight years preceding his defence before King Agrippa, he had continued witnessing "none other things, to small and great, than "those which the Prophets and Moses did say should come." Many particulars in the history of the Old Testament are repeated in the New, in very nearly the same words; and the New, in various passages, expressly asserts the infallibility of the Ancient Oracles; and, if we admit the veracity of the one, we cannot reasonably question the inspiration of the other.

653

University of Edinburgh.

Rev. Dr. Lee.

8 November 1827.

As connected with these considerations, we must not omit the advantage which the Theological Student derives from the early history of Christianity, in enabling him to form a just estimate of the various modes of interpreting the Scriptures. It would obviously be desirable that we should be acquainted both with the earliest method of educating the public teachers, and with the most approved forms of expounding the doctrines of Religion. Though human learning occupied only a subordinate share of attention, it was not disregarded in the days of the primitive Church. We are not to draw our conclusions on this subject from the case of inspired Apostles, furnished with supernatural endowments; but even in their peculiar circumstances, though they often caution the converts against relying on the knowledge which puffeth up, and against that *false philosophy* which is apt to mislead men from the simplicity of the Gospel, their reasonings are so conducted, as to approve themselves chiefly to the understandings of those who must have been more than novices; and they frequently allude to particulars, which could be intelligible only to those who had given all diligence to add to their faith every attainable branch of useful knowledge. In the subsequent age, we must expect to discover a train of discipline modified by the change of circumstances. When the gift of tongues had ceased, and supernatural knowledge vanished away, those who were dedicated to the service of the Church, pursued the study of human literature in the Sacred Schools or Gymnasia, such as are said to have been established at Alexandria, and at Ephesus, so early as the lifetime of the Evangelists Mark and John. In subserviency to the knowledge of the Scriptures, the learned languages were studied with care; and all those branches of secular instruction were prosecuted which were necessary to qualify the future Teachers to engage in controversy with the Pagans. Both in the Alexandrian School, and in other similar foundations, the profane sciences were introduced at a very early period; and they were soon encouraged to a degree which had nearly proved fatal to Christianity, by deforming its doctrines, and almost annihilating its spirit. The Eclectics, by attempting to combine their views of Platonism with the principles of the Gospel, were but too successful in contaminating the faith; and by their influence a tone was communicated to the style of didactic eloquence, which, both in respect of the matter and the manner, must be regarded as an egregious departure from the primitive models. Other systems, not more pure, soon succeeded; and to this day their effects are not completely removed.

Attention to these particulars is necessary, not only for the purpose of enabling us to give an intelligible account of the rise and progress of the different systems professedly established on the basis of Revelation, but also as affording practical lessons of first-rate utility. When we review the fatal consequences of that inexcusable facility with which many early Christians consented to accommodate some of their tenets and observances to the sentiments prevalent in the most celebrated philosophical sects, and to the solemnities of heathen worship, we cannot resolve too earnestly to watch against every innovation, not only in religious opinion, but even in the use of religious language. Those of the first Christians, who adopted the phraseology either of the Platonists or Peripatetics, little imagined that they were thus paving the way for the reception of the most corrupt and antichristian doctrines, and those who first conformed to the use of certain ornamental and apparently innocent formalities, which had incidentally been connected with the Pagan ceremonies, were far from anticipating the adoration of relics, the veneration for images, the prayers for the dead, the multiplicity of festivals, and the invocation of saints, with numberless other unscriptural deviations from the spirituality of Christian worship. Perhaps one of the most valuable counsels which can be drawn from the survey of those times, is that which impresses on us the risk which we run by showing too great deference either for illustrious names, or for what is called public opinion,—particularly when they would tempt us to indulge in rash and novel speculations with respect to divine things. Some men, of the highest intellectual eminence, in the early ages of the Church, were among the least safe of all the guides whom their less accomplished brethren could have followed; and some of the worst heresies took their rise from the daring reasonings of ingenious men of a metaphysical turn, who, not content with exercising their faculties in the field of practicable discovery, adventured to soar into those inscrutable regions which the imperfect powers of the human intellect can never hope to reach.

Another object which we should have in view in consulting the annals of the primitive Church, is to collect such facts, with respect to the first propagators of Christianity, as tend to illustrate their writing, and confirm their credibility. It is not enough to say, that the characters of men and the representations of events, exhibited in the pages of the sacred volume, correspond with the pictures drawn by every ancient author of good reputation. It must never be forgotten, that the eye-witnesses and ministers of the word who have delivered to us the things revealed by the Spirit, passed through a severe ordeal in verification of their claims to be recognised as honest chroniclers of what they had seen and heard, and faithful messengers of the Divine Will. Every one of them proved, by his self-denial, by his steadfast obedience, by his magnanimous contempt of secular distinctions, by his patience, his temperance, his rectitude, and his charity, that he was actuated by the spirit of power, of love, and of a sound mind. Many of them, after enduring contradiction, ignominy, and torment, sealed their testimony with their blood. Their constancy was not like the frenzy of the enthusiast, braving danger and defying pain. It was a rational principle, sober and steady in its operation, and uniformly indicating the heavenly source from which it flowed. It was a principle incompatible with pride, or vain glory, the fear of censure, or the desire of applause. It was an impulse incomparably more dignified than the apathy of the stoic or the fool-hardiness of the savage. It was an energy, calm, gentle, and peaceable in its fruits, breathing neither ferocity nor defiance, but overcoming evil with good. It was a sublime emotion, which neither the menaces nor the enticements of sinners could suppress, and which neither force nor artifice could extinguish. Its influence over the thoughts and actions of the persecuted followers of the cross, proves incontrovertibly that they were fully persuaded of the truths which they promulgated,—that they were supported by the testimony of a good conscience,—that they were exempted from the prevalence of selfishness, ambition, and vanity, and that they were cheered by the certain hope of a glorious recompence. On facts like these may be constructed an argument of no trivial importance in favour of the truth of Christianity.

An additional object to be pursued in the examination of the primitive Church, and the lives of the early Christians, is the exhibition of such an attractive picture of pure and undefiled religion, as cannot be traced in any other model, except that of the Divine Author and Finisher of our Faith. Some have considered it as almost the only purpose of Church History, to delineate the characters of those distinguished votaries of the truth, who have most eminently adorned the doctrine of their Saviour, by an example of all that is pure and amiable, generous and excellent, in the human character. But, without thus limiting the province of Historical Theology, we must surely admit that this is a view which is by no means to be overlooked.

University of Edinburgh.

Rev. Dr. Lee.

8 November 1827.

A further purpose must be attempted to be promoted by the Historian of the early Church, in rendering the information which he conveys, subservient to the elucidation of such passages in the New Testament as are most puzzling to the unlearned. Some very minute references, which to superficial readers appear to be nugatory, and almost unmeaning, are found, on examination, to be highly significant. Such particulars occur frequently in the Epistles, and would be quite unintelligible, unless we knew where to obtain additional information. It is requisite also, that we should bring down our inquiries beyond the conclusion of the Sacred Record, if we wish to understand how justly the new dispensation is always represented in the Scripture as a progressive scheme, which, rising from a beginning which attracted little observation, was gradually matured and strengthened, till it gained the ascendency which it was destined to maintain. The Gospels and Epistles show us what benefits Christianity promised to confer. The History of the Church shows us what benefits were actually conferred on those who received it, and what fruits it yielded, even to those who derided its forms, and were strangers to its power, but who yet became indirectly partakers of its temporal advantages.

The early history of Christianity ought also to be so studied, as to enable us to judge, what is the purest model of an Ecclesiastical Constitution. This is a subject which has occasioned many controversies, and its importance may have sometimes been overrated. But it is material to the peace and order of the community, that the laws of Ecclesiastical Polity should be established in conformity with the wise regulations prescribed by the Divine Head of the Church; and though some of the mmay, to a certain extent, admit of modifications, suited to the different states of society, it can never be regarded as a matter of indifference, that their spirit should be maintained inviolate, and the administration of them guarded against the innovating humour of designing men. For this reason, it is essential that we should be correctly informed with regard to the rules of government and modes of discipline practised in the primitive Church.

On these matters I may observe, finally, that though it is indispensable that the Lecturer on Ecclesiastical History should store up a large induction of facts, as the basis of the general conclusions which he draws, it is not enough to be possessed of a vast mass of undigested information. This can really be of very little avail, especially if it refer as much to immaterial circumstances as to those great truths which are of primary moment. There are many particulars in the history of the Church, a minute knowledge of which can neither be pleasing nor profitable; and, therefore, it is necessary, in all our researches on such a subject, to select that kind of information which promises to be of solid use, without aspiring at the empty distinction of being profoundly skilled in points which, though explored with the utmost industry, may fail to impart any additional wisdom.

These general views, though very imperfectly, or scarcely at all, illustrated, are intended merely to show, what are the portions of Church History on which it is most necessary to dwell, and what are the applications of historical knowledge which it is most essential to bring under the notice of students of Theology.

* * * * * * * *

With regard to the most advantageous Theological Course, my deliberate opinion is this:—Every student should attend regularly a course of four Sessions, each Session occupying six months, or five at the least.

1*st Year*, Hebrew, Ecclesiastical History, and a Junior Class of Theology, comprehending a general and methodical view of all the doctrines of Revelation, with an account of the books which may be most profitably consulted on every distinct branch.

2*d Year*, Hebrew, Ecclesiastical History (including Polemics), and one-half of the detailed Course of Systematic Theology.

3*d Year*, Biblical Criticism, Evidences of Revealed Religion, and another half of Systematic Theology.

4*th Year*, Biblical Criticism, and Hermeneutics—Pastoral Theology—and that branch of Ecclesiastical History which relates to the government and laws of the Church.

One Discourse or Exercise, at the least, to be required from every student in every class, during the Session—the subjects to be prescribed methodically, on the branches of instruction pursued in that Session, and the discourses to be delivered in the order previously fixed by the Professor.

By this plan, the Principal is understood to Lecture two Sessions,—2d and 4th, or 3d and 4th—the former Session on the Evidences, and the latter on Pastoral Duties. The former Class may be attended by all students; the latter only by students of Divinity.

The Professor of Hebrew to teach the students of Theology two years,—it being understood that he has another Class for Oriental Languages.

The Professor of Systematic Theology to lecture three Sessions, and to enrol the students a fourth, during which every one must deliver a Discourse. Four Discourses in all to be delivered before this Professor.

The Professor of Biblical Criticism to lecture two Sessions, and to hear at least two Discourses, one an Exercise on the Old Testament, and another on the New.

The Professor of Ecclesiastical History to lecture three Sessions, and to hear at least three Discourses, one of them being an Exegesis on a controverted head in Divinity.

The Principal, and other Professors above enumerated, to be considered equally as Professors of Theology, and to sit in Church Courts as Ministers, in virtue of their several offices.

In Universities, not nearly so numerously attended as Edinburgh and Glasgow (as the Examinations of Classes, the revision of written Exercises, and the hearing and criticising of Discourses, can be overtaken in less time), it may be practicable to distribute the several departments of study in such a manner as to have them all sufficiently discussed by four Professors.

* * * * * * * *

In my opinion, it would be an advantage, to unite the two Colleges of St. Andrews under one Principal, whose accumulated duties would not be more laborious than those of the other Principals in the Universities of Scotland.
